On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **4.1.2 Natural Health Product Regulations (under the Food and Drugs Act)**

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### *Belgium*

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

---

5

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been

reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>17</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>19</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not

associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. intravenous, intramuscular, inhalation and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

<sup>33</sup> Valdés LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated, which is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and salvinorin A is relatively unknown.

There is, however, some data regarding the use of *Salvia divinorum* in Canada. As there are no approved uses for this plant, any use (i.e. for consumption) is illegitimate in nature. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined *Salvia* for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used *salvia* in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the

<sup>45</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented

<sup>47</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>48</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>50</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>51</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. *Planta Med* 2007 Jun;73:1039-1046.

to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have  
s.21(1)(a) been received through the Canada Vigilance database, it is important to note that the number of  
s.21(1)(b) reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

## 5. ASSESSMENT OF RISKS AND BENEFITS

<sup>53</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other drug promotion sites and is often

<sup>56</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

s.21(1)(a)

s.21(1)(b)

touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and/or its pharmacological effects.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the previously-described criteria upon which scheduling is based. In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada. Therefore, it would not be appropriate to include *S. divinorum* and/or salvinorin A under any of the Schedules to the CDSA at this time.

## 8. RECOMMENDATIONS

<sup>57</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

s.21(1)(a)

s.21(1)(b)

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products/ hallucinogens can be refused for import under the NHPR.

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient/salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has

also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, <sup>MHPD</sup> (MHPD), NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

5

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

### **4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

---

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug. <sup>and if</sup>

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been

reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience ~~is~~ quite unique.<sup>17</sup>  
*are*

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>19</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Commercial

Similarly, there are no known industrial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not

associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. <sup>inhalation route</sup> intravenous, intramuscular, ~~inhalation~~ and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine <sup>and</sup> as well as the impact of dose on ~~the rewarding and aversive~~ effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated, <sup>grams</sup> which is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and <sup>10<sup>r</sup></sup>salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada. ~~As there are no approved uses for this plant, any use (i.e. for consumption) is illegitimate in nature.~~ Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

despite the lack of legitimate uses for this plant

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the

<sup>45</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. <sup>46</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented

<sup>47</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>48</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

s.21(1)(a)

s.21(1)(b)

to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

## 5. ASSESSMENT OF RISKS AND BENEFITS

<sup>53</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

**Page(s) 000982 to\à 000982**

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other drug promotion sites and is often

---

<sup>56</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.haz000983](http://www.research.haz000983)

**s.21(1)(a)**

**s.21(1)(b)**

touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and/or its pharmacological effects.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the previously-described criteria upon which scheduling is based. In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time<sup>HPFB</sup> this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada. Therefore, it would not be appropriate to include *S. divinorum* and/or salvinorin A under any of the Schedules to the CDSA at this time.

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products/ hallucinogens can be refused for import under the NHPR.

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

CSS WLT.  
JK.

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

### **4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

---

5

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been

reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>17</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>19</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not

associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

<sup>33</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined *Salvia* for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used *salvia* in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of

samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the

experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented

**s.21(1)(b)**

to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other drug promotion sites and is often

s.21(1)(a)

s.21(1)(b)

touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and its pharmacological effects.

an organic function.

human can modify

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling is based. In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

decisions are made within HCSB

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada. Therefore, it would not be appropriate to include *S. divinorum* and/or salvinorin A under any of the Schedules to the CDSA at this time.

s.21(1)(a)

s.21(1)(b)

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products/~~hallucinogens~~ can be refused for import under the NHPR.

*modifying organic functions*

## 10. IMPLEMENTATION AND EVALUATION

History:  This message has been forwarded.

Hi Tiffany,

This doc is for circulation to CSS WG members. Correct me if I am wrong, but it is my understanding that salvia is not actually on our agenda this week, this is just to get people started reading before discussion at our next meeting. Just that I would like Stephanie (officer responsible here in OCS) to be there when it is discussed, and I think it will be critical to have at least NHPD there.

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

heck  
egs.  
schedule 1  
included  
substance  
nothing on  
sched 1  
(excluded)

state more clearly

non-compliance  
NHP

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

substance to  
assess.

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

##### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as ~~the most~~ potent natural hallucinogen ever isolated.<sup>6</sup> *as LSD.*  
*- as potent as LSD. (sp?)*

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been

<sup>6</sup> Ott J. Ethnopharmacognosy and human pharmacology of *Salvia divinorum* and salvinorin A. *Curare*. 1995 18: 103-129. Unofficial transcription available online. URL <http://www.sagewisdom.org/ott2.html>

reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>12</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>13</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>14</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>15</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>16</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>17</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>18</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>19</sup> Its main use today is, however, for its psychoactive properties in the aid of producing

- culture specific - not necessarily relevant to use in Canada.

- highlight traditional medical uses (they are legitimate) - don't differentiate b/w spiritual & medical treatment in traditional cultures.

"mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>20</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>21</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>22</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>23</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

if to be an agonist for some claim in Canada, this use is not in the context of use in Canada.

- Rickter's seed company, check catalogue.

- claims for use as an incense - illegitimate - no evidence it has any fragrant properties that would legitimize its use as an incense

4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

- Similar to LSD, which is a controlled substance.

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>24</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>25</sup>

Physical dependence necessary for addiction - addiction potential low but not necessarily negligible

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>26</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>27</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>28</sup>

Smoking is by far the most popular method of administration<sup>29</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>30</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>31</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

<sup>30</sup> Valdés LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

<sup>31</sup> Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry.* 2005 Jan;38(1):1-5.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>32</sup> The extraction of salvinorin A from the plant is very easy, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough substance to provide for 2000 human doses.<sup>33</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and

<sup>32</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>33</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

- too early to see a trend in use  
- 5% of youth use is significant

- legal to possess

- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

- mainly adolescent use

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

- theoretically samples would not be seized if LEA knew it was Salvia b/c not controlled

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

- CBSA seeing a lot of it cause shipped in.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

(Number of Items/Exhibits)

<b>TOTAL</b>	0	0	1	1	2	8	12	12	70	34

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one

International Use Stats. ← Alison monitoring surveys

author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>34</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>35</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>36</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>37</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>38</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>39</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

personal risk is there

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>40</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>41</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>42</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>43</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

NIDA  
- compromise ability

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>44</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>45</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

- case report

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

elaborate on NHPR limit use to incense.

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>48</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

s.21(1)(a)

s.21(1)(b)

not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

1

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that that product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a *natural health product monograph* prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances, substances that are traditional medicines or that are homeopathic medicines, and that none of the ingredients are substances set out on Schedule 2 which is a list of excluded substances, e.g. any substance listed on Schedules I to V of the Controlled Drugs and Substances Act. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 and thus Schedule F to the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it and manufactured, sold or represented for that purpose meet the definition of an NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are

illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 **Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

---

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

#### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

#### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications.. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, , Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

##### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

##### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

##### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen

is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### *North Carolina*

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### 44.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A {need reference}. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa* {reference needed}. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens {reference?}. Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at  $\kappa$ -opioid (KOR) receptor.<sup>7</sup> Its mechanism of action is therefore unique.<sup>8</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity,

<sup>6</sup> Ott J. Ethnopharmacognosy and human pharmacology of *Salvia divinorum* and salvinorin A. *Curare*. 1995 18: 103-129. Unofficial transcription available online. URL <http://www.sagewisdom.org/ott2.html>

**Deleted:** It thus affects the brain in a way that is quite unique

**Deleted:** Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.

**Formatted:** Font: Italic

**Deleted:** The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to

**Deleted:** be:

various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>10</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>11</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>12</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>13</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>14</sup> Its strong dissociative effects are often compared to those of ketamine {reference needed}. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>15</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>16</sup>

Comment [HABR3]: Definition ?

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>17</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>18</sup>

Comment [HABR4]: Are these psychedelic effects??

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of

effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>19</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>20</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>21</sup>

Smoking is by far the most popular method of administration<sup>22</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>23</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>24</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>25</sup> Its main use today is, however, for its psychedelic properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>26</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>27</sup> In addition, while it has been speculated that KOR agonists

may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder, <sup>28</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances. <sup>29</sup> That said there are presently no legitimate medical uses for *S. divinorum* in Canada.

Deleted: prove to

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal.

Comment [HABR5]: So?

Deleted: in order

Deleted: for its

Deleted: to utilize its

Deleted: psychoactive properties

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. <sup>30</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens. <sup>31</sup>

Comment [HABR6]: This paragraph needs a sentence or two which links these scientific findings to a rationale for why salvia is not addictive. There is much scientific information here but it needs to be explained. For example, why is the decrease in dopamine release in the nucleus accumbens important? What does this have to do with addiction or abuse?

<sup>37</sup> Bucheler R, Gleiter CH, Schworer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry.* 2005 Jan;38(1):1-5.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

Deleted: previously studied

Deleted: predict

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>39</sup>

Comment [HABR7]: Can this sentence be summarized somehow and made more convincing? So what we're trying to say is that the potential for abuse is high because we need very small doses.

Deleted: very easy

Deleted: substance to provide

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

<sup>38</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>39</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

**Comment [HABRS]:** Why is this important? What is the message we are trying to convey here?

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

(Number of Items/Exhibits)

Source	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009*

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>40</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>41</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>42</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>43</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>44</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>45</sup>

**Comment [HABR9]:** Why is this here at the end and what is its connection to seizure data? This should be placed higher up in the section.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences

<sup>40</sup> Turner DM. Salvinorin - The Psychedelic Essence of Salvia Divinorum. Panther Press, San Francisco, CA 1996.

<sup>43</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>44</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of Salvia divinorum (Diviner's Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

<sup>45</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

are frequent and loss of consciousness has been reported.<sup>46</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>47</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>48</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>49</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>50</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>51</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada

as well as the threat *S. divinorum* may pose to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting. Considering also the limited population exposure information, it is not possible to adequately characterize the risk to the general population.

**Deleted:** Although

**Deleted:** as a hallucinogen

**Deleted:** , it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>52</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>53</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>54</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, according to available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis.

Deleted: , according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and

<sup>52</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>53</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>54</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

[DD/MM/2010]

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

1

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

### **4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

---

5

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

**Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

**4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

**Deleted:** !

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A {need reference}. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa* {reference needed}. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

**Comment [HABR1]:** What is the potency relative to other hallucinogens?

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens {reference?}. Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at κ-opioid (KOR) receptor {ref}. Its mechanism of action is therefore unique.<sup>7 8</sup>

**Deleted:** It thus affects the brain in a way that is quite unique

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of

**Deleted:** Recent pharmacological screenings of receptors have found it to be a highly potent and selective κ-opioid receptor (KOR) agonist.

**Formatted:** Font: Italic

**Deleted:** The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to

**Deleted:** be:

**Comment [HABR2]:** Can we qualify that? What does "best" mean in this case?

<sup>6</sup> Ott J. Ethnopharmacognosy and human pharmacology of *Salvia divinorum* and salvinorin A. *Curare*. 1995 18: 103-129. Unofficial transcription available online. URL <http://www.sagewisdom.org/ott2.html>

<sup>7</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>8</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A*. 2002 Sep 3;99(18):11934-9.

<sup>9</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

*S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>11</sup>

The psychomimetic (psychotomimetic) effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>12</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>13</sup> Its strong dissociative effects are often compared to those of ketamine {reference needed}. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>14</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>15</sup>

**Comment [HABR3]:** We have too many "psycho" terms. Psychoactive, psychomimetic, psychotropic, psychedelic. Either we use one or we have to define them. Are they different?

**Comment [HABR4]:** I think we should perhaps say "schizoid" not schizophrenia.

**Comment [HABR5]:** Definition ?

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations {reference needed}. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>16</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>17</sup>

**Comment [HABR6]:** Are these psychedelic effects??

**Comment [HABR7]:** Too many ideas in this paragraph. In addition, we say that Salvia's properties are unique, but here we seem to imply that it shares some properties to other KORs such as pentazocine.

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>18</sup> where an infusion of the leaves or the leaves themselves are

<sup>18</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>19</sup> Its main use today is, however, for its psychoactive properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>20</sup>

**Comment [HABR8]:** Similar comment as above on the meaning and interchangeability of the terms psychoactive, psychedelic etc.... Psychedelic may be more appropriate here since it may refer to transcendental or mystical experiences.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>21</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>22</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>23</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

**Deleted:** prove to

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal.

**Comment [HABR9]:** So?

**Deleted:** in order

**Deleted:** for its

**Deleted:** to utilize its

**Deleted:** psychoactive properties

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine (?), KOR agonists are negatively reinforcing and aversive.<sup>24</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the

nucleus accumbens.<sup>25</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>26</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>27</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>28</sup>

Smoking is by far the most popular method of administration<sup>29</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>30</sup>

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of

**Comment [HABR10]:** This paragraph needs a sentence or two which links these scientific findings to a rationale for why salvia is not addictive. There is much scientific information here but it needs to be explained. For example, why is the decrease in dopamine release in the nucleus accumbens important? What does this have to do with addiction or abuse?

**Comment [HABR11]:** Why is this important?

**Comment [HABR12]:** How does this relate to potential for abuse or addiction liability? This paragraph belongs more in the section on pharmacology.

**Comment [HABR13]:** This para belongs in the pharmacology section.

**Comment [HABR14]:** What does this have to do with potential for abuse or addiction liability?

tolerance.<sup>31</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>32</sup> The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>33</sup>

**Comment [HABR15]:** Can this sentence be summarized somehow and made more convincing? So what we're trying to say is that the potential for abuse is high because we need very small doses.

**Deleted:** very easy

**Deleted:** substance to provide

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

**Comment [HABR16]:** Need to re-order these in the order that they are presented below.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

<sup>31</sup> Bucheler R, Gleiter CH, Schworer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>32</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>33</sup> Valdés LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table:

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

**Comment [HABR17]:** Why is this important? What is the message we are trying to convey here?

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>34</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>35</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>36</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>37</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>38</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>39</sup>

**Comment [HABR18]:** Why is this here at the end and what is its connection to seizure data? This should be placed higher up in the section.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences

<sup>34</sup> Turner DM. Salvinorin - The Psychedelic Essence of Salvia Divinorum. Panther Press, San Francisco, CA 1996.

<sup>37</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>38</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of Salvia divinorum (Diviner's Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

<sup>39</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

are frequent and loss of consciousness has been reported.<sup>40</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>41</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>42</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>43</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

**Comment [HABR19]:** The case reports cited below do not relate to use but rather to the physiological and psychotropic effects of *S. divinorum* use.

**Deleted:** One report was

**Deleted:** a

**Formatted:** Font: Italic

**Deleted:** in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>44</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>45</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although

**s.21(1)(b)**

reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

de la Loi sur l'accès à l'information**

s.21(1)(a)  
s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>48</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, according to available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis.

Deleted: , according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

s.21(1)(a)  
s.21(1)(b)

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

DESCRIPTION/OVERVIEW

Salvia divinorum is a perennial herb in the mint family native to certain areas of the Sierra Mazateca region of Oaxaca, Mexico. The plant, which can grow to over three feet in height, has large green leaves, hollow square stems and white flowers with purple calyces, can also be grown successfully outside of this region. Salvia divinorum has been used by the Mazatec Indians for its ritual divination and healing. The active constituent of Salvia divinorum has been identified as salvinorin A. Currently, neither Salvia divinorum nor any of its constituents, including salvinorin A, are controlled under the federal Controlled Substances Act (CSA). However, the abuse of Salvia Divinorum is gaining popularity in the United States, particularly by adolescents and young adults.

CONTROL STATUS

Salvia divinorum and salvinorin A are not currently controlled under the CSA. number of states have placed controls on Salvia divinorum and/or salvinorin A legislation section of this page for more information.

STREET NAMES

Maria Pastora, Sage of the Seers, Diviner's Sage, Salvia, Sally-D, Magic Mint

SHORT-TERM EFFECTS

A limited number of studies have reported the effects of using either plant mat salvinorin A. Psychic effects include perceptions of bright lights, vivid colors ; well as body movements and body or object distortions. Other effects include uncontrolled laughter, a sense of loss of body, overlapping realities, and halluc (seeing objects that are not present). Adverse physical effects may include inco dizziness, and slurred speech.

Scientific studies show that salvinorin A is a potent and selective kappa opioid 001071

agonist. Other drugs that act at the kappa opioid receptor also produce hallucin and dysphoria similar to that produced by salvinorin A. Salvinorin A does not serotonin 2A receptor, which mediates the effects of other schedule I hallucin

Due to the hallucinogenic effects there is a substantial risk of injury or death of impaired judgment due to disruptions of sensory and cognitive functions

**LONG-TERM EFFECTS**

**TRAFFICKING TRENDS**

Salvia divinorum is grown domestically and imported from Mexico and Central America. The Internet is used for the promotion and distribution of Salvia divinorum sold as seeds, plant cuttings, whole plants, fresh and dried leaves, extract-enhancers of various strengths (e.g., 5x, 10x, 20x, 30x), and liquid extracts purported to contain salvinorin A. These products are also sold at local shops (e.g., head shops and smoke shops) and over the internet as a "legal alternative to controlled hallucinogens". DEA is not aware of any legitimate medical use.

**USE/USER POPULATION**

According to a National Survey on Drug Use and Health Report published by SAMHSA in February 2008, it is estimated that 1.8 million persons aged 12 or older used Salvia divinorum in their lifetime, approximately 750,000 did so in the past year. Use is most common among young adults (18 to 25 years old) as opposed to older adults (26 to 50 years of age). Young adults were 3 times more likely than youths aged 12 to 17 to have used Salvia divinorum in the past year. Use is more common in males than females.

**ARRESTS/SENTENCING**

**DEA DRUG SEIZURES**

**LEGISLATION**

As of November 2008, thirteen states have enacted legislation placing regulatory controls on Salvia divinorum and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Missouri, North Dakota, Oklahoma, and Virginia have placed Salvia divinorum and salvinorin A into schedule I of state law. California, Louisiana, Maine and Tennessee have enacted other forms of legislation restricting the distribution of the plant. State legislative bills proposing regulatory controls that have not passed are in Alabama, Alaska, Hawaii, Iowa, Minnesota, Nebraska, Oregon, South Carolina, and Utah. Legislative bills proposing regulatory controls are pending in Michigan, New Jersey, New York, Ohio, Pennsylvania, and Rhode Island.

Texas and Wisconsin.

Salvinorin A and/or Salvia divinorum have been placed under regulatory control in  
Australia, Belgium, Denmark, Estonia, Finland, Italy, Japan, Spain, and Sweden.

## *Salvia divinorum* and salvinorin A

---

*Salvia divinorum* is a perennial herb in the mint family native to certain areas of the Sierra Mazateca region of Oaxaca, Mexico. It is not controlled under the federal Controlled Substances Act (CSA). The plant has large green leaves, hollow square stems and white flowers with purple calyces. Street names for *Salvia divinorum* are Maria Pastora, Sage of the Seers, Diviner's Sage, Salvia, Sally-D, and Magic Mint. The active constituent of *Salvia divinorum* has been identified as salvinorin A, also called Divinorin A. Salvinorin A is believed to be the ingredient responsible for the hallucinogenic effects of *Salvia divinorum*. The active ingredient is a neoclerodane diterpene found primarily in the leaves, and to a lesser extent in the stems. *Salvia divinorum* is imported from Mexico and Central and South America is sold through the internet or local shops (e.g., head shops and tobacco shops) as seeds, plant cuttings, whole plants, fresh and dried leaves, extract-enhanced leaves of various strengths (e.g., 5x, 10x, 20x, 30x), and liquid extracts. As of November 2008, thirteen states have enacted legislation to place regulatory controls on *Salvia divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Mississippi, Missouri, North Dakota, Oklahoma, and Virginia have placed the drug and/or its constituent into schedule I of state law. The states of California, Louisiana, Maine and Tennessee enacted other forms of legislation restricting distribution of the plant. States in which legislative bills proposing regulatory controls died are Alabama, Alaska, Hawaii, Indiana, Iowa, Minnesota, Nebraska, Oregon, South Carolina, and Utah. Legislative bills proposing regulatory controls are pending in Michigan, New Jersey, New York, Ohio, Pennsylvania, Texas, and Wisconsin.

*Salvia divinorum* was first discovered in the late 1930s by anthropologists studying medicinal and magical cures in Mexico. It has been used by the Mazatec Indians for its ritual divination and healing. In the United States, the plant material is typically chewed or smoked. When chewed, the leaf mass and juice are absorbed across the lining of the oral mucosa (buccal). Effects first appear within 5 to 10 minutes. Dried leaves and extract-enhanced leaves are smoked. When an individual smokes pure salvinorin A, at a dose of 200 to 500 micrograms, effects are experienced within 30 seconds and last about 30 minutes. A limited number of studies have reported using either plant material or salvinorin A. Psychic effects include perceptions of bright lights, vivid colors and shapes, as well as body movements and body or object distortions. Other effects include dysphoria, uncontrolled laughter, a sense of loss of

## *Salvia divinorum*

### *Drug Fact Sheet*

body, overlapping realities, and hallucinations. Adverse physical effects may include incoordination, dizziness, and slurred speech.

The **National Survey on Drug Use and Health** (formerly the National Household Survey on Drug Abuse) is a Substance Abuse and Mental Health Services Administration (SAMSHA) database which measures drug use by people living in U.S. households. According to the first NSDUH report on *Salvia divinorum*, published by SAMHSA in February 2008, it is estimated that 1.8 million persons aged 12 or older used *Salvia divinorum* in their lifetime; 756,000 used the drug in the past year. Use was more common among young adults (18 to 25 years old), as opposed to older adults (> 26 years of age). Young adults were three times more likely than youth aged 12 to 17 to have used *Salvia divinorum* in the past year. Males aged 12 to 17 were three times more likely to use *Salvia divinorum* than females, while males ages 18 to 25 were four times more likely to use the drug.

A National Institute on Drug Abuse-funded study conducted by the University of Michigan, **Monitoring the Future**, measures prevalence of drug use among eighth, tenth, and twelfth graders. Data for *Salvia divinorum* is not collected in this study.

The **National Forensic Laboratory Information System (NFLIS)/System to Retrieve Information from Drug Evidence (STRIDE)** is a DEA database that collects scientifically verified data on analyzed samples in state and local forensic labs. It also includes data from STRIDE, which are analyzed samples from DEA labs. The following table shows *Salvia divinorum* items seized from 2000 through 2008.

#### **ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES** (Number of Items/Exhibits)

Subject Re: Fw: Salvia IAS 

Right, and my point is that we hadn't charted a course in which all Inspectorate staff were being provided with an opportunity to provide comments; I am trying to find out exactly how this document got circulated so widely but suspect, as I said in my last message, that it was the HPFBI rep to the CSS WG being a bit keen and not informing us of his plans.

Won't comment on the BZP IAS as there again, I did not know it had been circulated wider than the CSS WG.

Clearly something I will have to take up with our HPFBI contact.....

As for your providing input/ accessing final IAS', I think we just have to come up with a process that works for all, and if you would like to propose something, I will be happy to consider it. I will tell you that I am not keen on our draft documents being posted in your database as then we get version control issues and potentially different HC staff (in different locations) referencing documents that are out of date. You can certainly post our final IAS' though as once they go through discussion by the CSS WG and are signed off by Diane, they are considered final and should not be changing in the future.

Here is the one for BZP:

FINAL (signed) BZP-TFMPP IAS 2010-07-13.pdf

Cheers  
Jocelyn

PS Out of the office for two weeks of holiday/ business travel; feel free to send comments on the Salvia IAS to Stephanie Chandler.

Subject Re: Fw: Salvia IAS 

Thanks Jocelyn, it's odd, since a day prior to Ian's email from MB, someone in BC also printed me a copy of this and left it outside my office. Then of course the next day I get the email from Ian, which I fwd' on.

I simply think that if all the Inspectorate staff are being given an opportunity to provide comments, then Controlled Substances staff in the regions should too. Something similar occurred with the Draft BZP IAS, which I also received through the inspectorate. 

FYI- I would like to post in our database the final versions of the IAS' , is there a way for me to tap into these and post for Controlled Substances staff in the region?

I appreciate the clarification and understand the intent was not to share with all at this time. Anyway, thanks again and enjoy your weekend.

Subject Re: Fw: Salvia IAS 

Hi Omar

I am as confused as you are by the message below as while we have circulated our draft IAS on salvia to our Controlled Substances Scheduling Working Group (an interbranch working group that helps us with scheduling decision), and there is a rep from HPFBI on it, the WG itself has not yet met to discuss the IAS and I was not aware nor would I have said it was appropriate for the HPFBI to have circulated this document without asking us first. That said, I can only assume that the doc was circulated so that the HPFBI rep could be better informed at the CSS WG meeting next week.

While it was our intention to circulate the IAS to the Controlled Substance Program inspectors in RAPB once it had been through the CSS WG, I suppose you are all free to provide input now that you have the document in hand.

Please note that any comments should be addressed to Stephanie Chandler.

Hi Jocelyn, I was wondering if the Controlled Substances Program in the regions can also get on the OCS mailing list. Often we hear about these draft/final IAS' through our inspectorate colleagues, I am hopeful we can get this directly from our national office instead.

Thanks,

Subject Re: Fw: Salvia IAS

No worries Collin, and Irshad, certainly don't stop anyone from providing input. I think the issue here is that irrespective of what the process used with the BZP IAS was, I just wasn't aware that it was being followed for Salvia, and the way that I found out about it was because one of the CDSA inspectors got the IAS from one of the DSCIV members and then asked me why they had not received it directly. Just kind of put me in an awkward position.

No matter, and now that we know how the HPFBI likes to get input, we are good.

I too will not be at the next CSS WG meeting but Stephanie will be there to track the discussion and accept everyone's feedback.

Cheers

**Subject:** Re: Fw: Salvia IAS

s.16(2)(c)

Hi Jocelyn

As Irshad is the SCDI representative I had asked him to share with the regions as this was the Inspectorate process followed for the draft BZP IAS. I have included the most recent invitation and note from the CSS WG below. Though perhaps the intent, it did not specify that the document was to be kept internal to the CSS-WG. I was aiming to have some preliminary feedback from the Inspectorate for discussion at the next meeting. My apologies if I jumped the gun and the intention was to review internally (CSS-WG) prior to distributing. As you noted, perhaps the process can be made more clear by including any temporary restrictions to sharing in the future.

Please also note that I have delegated the next meeting to Irshad as I will be away on holidays this week.

Irshad - can you kindly inform the regions that another draft/opportunity to review will be forthcoming and they may disregard my request to review at this time.

Tiffany - are these the telecon coordinates? [redacted] conference code [redacted] If not, could you please forward to Irshad?

My apologies for any headaches!  
Collin

In preparation for the next meeting, please find the attached the current draft of the IAS on Salvia for review. The agenda and the ROD from July will be send prior to the meeting. Should you have any further questions, please do not hesitate to contact me.

Subject Fw: Salvia IAS

Hi Irshad,

I am wondering if you can tell me how you obtained a copy of the draft IAS on salvia included in the message below? Just that our office is the author of the document and the only group to whom the document has been circulated yet is to our Controlled Substances Scheduling Working Group (CSS-WG), an inter-branch working group that helps with scheduling-related issues. Not that we don't welcome input from a cross-section of HPCFB employees, it just isn't part of our process to get that input at this point, as to us, the document is still what we would consider an internal draft, and we had intended to have it go through at least one round of discussion within the CSS-WG before circulating the document for wider input.

In this regard, perhaps we can work together on a better process for this type of interaction in the future.

That said, now that the document is out there, of course, we welcome any comments your committee may have. Any such comments can be directed to Stephanie Chandler, as she is the lead on this file in my office.

Regards  
Jocelyn

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

Deleted: In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).

ongoing media interest regarding the availability of *S. divinorum* in Canada.

3. PURPOSE

Deleted: 2

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

Deleted: of

Deleted: or not they

4. CONTEXT

Deleted: 3

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

Deleted: alternative to street drugs

Deleted: , and

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Deleted: (a

Deleted: that

Deleted: ).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Deleted: should be restricted from over-the-counter use. Should any such unauthorized health products be found on the Canadian market, they should be removed from sale. Such products

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### 4.1 Relevant Legislative Frameworks in Canada

##### 4.1.1 Food and Drug Regulations (under the Food and Drugs Act)

The Food and Drug Regulations (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

Deleted: the Inspectorate of HPFB (

comments to this section from NHPD

4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

Deleted: 3

The Natural Health Products Regulations (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a natural health product monograph or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed, which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

Deleted: came into force in January 2004

Deleted: requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
(b) restoring or correcting organic functions in humans; or
(c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP (no direct) health claims need to be made regarding the substance. In the case of S. divinorum, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function.

Therefore, products containing it meet the definition of a NHP.

Deleted: such

Deleted: would be considered

Deleted: s

Deleted: anuar

As of July 2010, no products containing S. divinorum have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of S. divinorum are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

Deleted: such as

Deleted: of

4.1.3 Controlled Drugs and Substances Act and its Regulations

Deleted: 3

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- (+/-) • International requirements and trends in the control and/or scheduling of the substance;
- (+) • Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
  - Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
  - Potential for abuse and/or addiction liability of the substance;
  - Evidence of extent of actual abuse of the substance in Canada and internationally; and
  - Risk to personal and public health and safety.

#### 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### Australia

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

✓ **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

Deleted: prohibited  
Deleted: by adding them

✓ **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

✓ **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

**Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e., beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

Deleted: (

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

**United States of America**

22 states

*S. divinorum* and salvinorin A are not included in the Schedules to the United States Controlled Substances Act although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July, 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

**California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

**Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

**Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

**North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## Tennessee

Formatted: Indent: First line: 1.27 cm

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

Deleted: ¶  
In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implications.¶

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Deleted: 3

Formatted: Underline

Formatted: Underline

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective κ-opioid receptor (KOR) agonist.<sup>8</sup>

Deleted: Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been

Indicence? should we address this

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

Deleted: for its

NHPD To provide wording as "indicence use" - not a real claim.

4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the kappa-opioid receptor (KOR), and in contrast to the euphoria produced by mu-opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not

Deleted: 3  
Deleted: Liability  
Deleted: Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the mu-opioid receptor (MOR) and can be habit-forming because activation of the MORs causes euphoria, which makes the user want to take them again. As previously mentioned, s

associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase, the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

**Deleted:** Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression. However, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>27</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

**Deleted:** s

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

**Deleted:** These methods rely on contact with the oral mucosa for absorption and

**Deleted:** . T

**Deleted:** es

**Deleted:** ¶

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

**Deleted:** This method of administration is the most powerful and only requires 200-500 micrograms of salvinorin A powder to produce the same effects as those of fresh leaves.

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

*cannabis*

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined *Salvia* for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used *salvia* in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of

 A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>41</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>42</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.¶

¶ In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a¶ 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>43</sup> ¶ ... [7]

in US

experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup>

**Deleted:** However, it is difficult to determine the influence these effects have on the use of *S. divinorum*.

#### 4.2.6 Risk to Personal and Public Health and Safety

**Deleted:** 3

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

**Deleted:** Overall Risk to Public Health and Safety of Canadians

**Formatted:** Underline

**Deleted:** in

**Deleted:** in Canada

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

**Deleted:** and

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Summarize this

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>5</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>6</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>7</sup>

It should be noted that alcohol and general depression were the main confounders in this case.

After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Subject CSS-WG Meeting: August 18th

Hi everyone,

Please find attached the draft agenda and ROD for your review in preparation for tomorrow's meeting **Wednesday August 18th 10-11:30am in Rm 405A, 123 Slater**. If you need to participate via teleconference please let me know prior to the meeting ( I will be out of the office from 8am-9:45 so please contact me today).

**Draft Agenda:**

- 1- Members' introduction
- 2- Approval of Agenda
- 3 - Approval of ROD from July 18th
- 4- Discussion on Salvia (Stephanie/Israd/All)
- 5- Next steps i.e next meeting scheduled September 15, 2010 Rm 405A

Draft Salvia Divinorum IAS\_July 12 2010.doc

CSS-WG July 2010 Meeting ROD\_TBinput.doc

Thank you,  
Tiffany

Office of Controlled Substances  
Tobacco and Drugs Directorate

---

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)**

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### *Belgium*

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to

---

5

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

#### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## Tennessee

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA

Deleted: !

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A {need reference}. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa* {reference needed}. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Comment [HABR1]: What is the potency relative to other hallucinogens?

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens {reference?}. Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at  $\kappa$ -opioid (KOR) receptor {ref}. Its mechanism of action is therefore unique.<sup>7 8</sup>

Deleted: It thus affects the brain in a way that is quite unique

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of

Deleted: Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.

Formatted: Font: Italic

Deleted: The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to

Deleted: be:

Comment [HABR2]: Can we qualify that? What does "best" mean in this case?

<sup>6</sup> Ott J. Ethnopharmacognosy and human pharmacology of *Salvia divinorum* and salvinorin A. *Curare*. 1995 18: 103-129. Unofficial transcription available online. URL <http://www.sagewisdom.org/ott2.html>

<sup>7</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>8</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A*. 2002 Sep 3;99(18):11934-9.

<sup>9</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

*S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>11</sup>

The psychomimetic (psychotomimetic) effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>12</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>13</sup> Its strong dissociative effects are often compared to those of ketamine {reference needed}. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>14</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>15</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations {reference needed}. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>16</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>17</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>18</sup> where an infusion of the leaves or the leaves themselves are

**Comment [HABR3]:** We have too many "psycho" terms. Psychoactive, psychomimetic, psychotropic, psychedelic. Either we use one or we have to define them. Are they different?

**Comment [HABR4]:** I think we should perhaps say "schizoid" not schizophrenia.

**Comment [HABR5]:** Definition ?

**Comment [HABR6]:** Are these psychedelic effects??

**Comment [HABR7]:** Too many ideas in this paragraph. In addition, we say that Salvia's properties are unique, but here we seem to imply that it shares some properties to other KORs such as pentazocine.

ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>19</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>20</sup>

**Comment [HABR8]:** Similar comment as above on the meaning and interchangeability of the terms psychoactive, psychedelic etc... Psychedelic may be more appropriate here since it may refer to transcendental or mystical experiences.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>21</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>22</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>23</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

**Deleted:** prove to

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal.

**Comment [HABR9]:** So?

**Deleted:** in order

**Deleted:** for its

**Deleted:** to utilize its

**Deleted:** psychoactive properties

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine (?), KOR agonists are negatively reinforcing and aversive.<sup>24</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the

nucleus accumbens.<sup>25</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>26</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>27</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>28</sup>

Smoking is by far the most popular method of administration<sup>29</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>30</sup>

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of

**Comment [HABR10]:** This paragraph needs a sentence or two which links these scientific findings to a rationale for why salvia is not addictive. There is much scientific information here but it needs to be explained. For example, why is the decrease in dopamine release in the nucleus accumbens important? What does this have to do with addiction or abuse?

**Comment [HABR11]:** Why is this important?

**Comment [HABR12]:** How does this relate to potential for abuse or addiction liability? This paragraph belongs more in the section on pharmacology.

**Comment [HABR13]:** This para belongs in the pharmacology section.

**Comment [HABR14]:** What does this have to do with potential for abuse or addiction liability?

tolerance.<sup>31</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>32</sup> The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>33</sup>

**Comment [HABR15]:** Can this sentence be summarized somehow and made more convincing? So what we're trying to say is that the potential for abuse is high because we need very small doses.

**Deleted:** very easy

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

**Comment [HABR16]:** Need to re-order these in the order that they are presented below.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

<sup>31</sup> Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>32</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>33</sup> Valdés LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

**Comment [HABR17]:** Why is this important? What is the message we are trying to convey here?

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>34</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>35</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>36</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>37</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>38</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>39</sup>

**Comment [HABR18]:** Why is this here at the end and what is its connection to seizure data? This should be placed higher up in the section.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences

<sup>34</sup> Turner DM. Salvinorin - The Psychedelic Essence of Salvia Divinorum. Panther Press, San Francisco, CA 1996.

<sup>37</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>38</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of Salvia divinorum (Diviner's Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

<sup>39</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

are frequent and loss of consciousness has been reported.<sup>40</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>41</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>42</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>43</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

**Comment [HABR19]:** The case reports cited below do not relate to use but rather to the physiological and psychotropic effects of *S. divinorum* use.

**Deleted:** One report was

**Deleted:** a

**Formatted:** Font: Italic

**Deleted:** in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>44</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>45</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although

reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>48</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, according to available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis.

Deleted: according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.reserach.hazelden.org](http://www.reserach.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

**s.21(1)(a)**  
**s.21(1)(b)**

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

DRAFT  
May 26, 2010

## **Media Lines**

### **Regulatory Control of *Salvia Divinorum***

#### **Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### **Key Messages:**

- **Health Canada advises Canadians not to use products containing *S. divinorum* because very little is known about the substance and its potential effects on the brain and/or body.**
- **Because of its hallucinogenic properties, products containing *S. divinorum* meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.**
- **It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* may be subject to compliance and enforcement action under the *Food and Drug Act*.**
- **Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.**

#### **Supplementary Messages:**

##### ***On the classification of *Salvia divinorum*:***

- **When products containing *S. divinorum* are manufactured, sold or represented for use in modifying organic functions in humans (where this would include having a hallucinogenic effect), they meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.**

It is illegal to sell NHPs in Canada unless they have been approved by Health Canada and assigned a Natural Product Number (NPN) or Drug Identification Number - Homeopathic Medicine. As of January 2010, no products containing *S. divinorum* s have however been approved for sale by Health Canada .

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

***If pressed on the lack of statistics on Salvia divinorum use in Canada:***

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010
- It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* without their being approved by Health Canada prior to sale.

With respect to adverse effects, not enough controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans and animals have been carried out. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*, and it is for this reason, that Health Canada is not proceeding to regulate it as a controlled substance at this point in time.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just

been released and data from the 2009 edition of CADUMS will be available in late June 2010.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize any risk of similar reactions to the general population. In particular, Health Canada does not have any information about the number of individuals in Canada using or who have used *Salvia divinorum*.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba indicate that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.
- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

## ***Salvia divinorum***

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is known to have psychotropic effects, which means it can affect the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience).

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

### **Risks Associated with the Use of *Salvia divinorum***

The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination; and
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The potential of *S. divinorum* to produce physical dependence and/or addiction is also not known.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the “Need More Info?” section below for links to resources that can help you with this.)

- 

### **Legal Status of *Salvia divinorum***

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010 no products containing *S. divinorum* have been approved by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). This is because there is not enough information available to determine whether regulation as a controlled substance is warranted. In an effort to collect more information about the use of *S. divinorum*, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009

Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Data from the Youth Smoking Survey was published on May 31, 2010 and indicate that 4.9% of responding students in Grades 7-12 have used *Salvia divinorum* at least once in the past year.

Data Data from these surveys and the 2009 edition of CADUMS (to be released in June 2010) will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, e.g., no sales to anyone under the age of 18, etc.

### **Background**

*S. divinorum* is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for both medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a “mystical” or hallucinogenic experience).

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

### **Health Canada’s Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada’s future approach to decision-making regarding *S. divinorum*.

Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

Report online at the [MedEffect™ Canada Web site](#)

Call toll-free at 1-866-234-2345

Complete a [Canada Vigilance Reporting Form](#) and either:

Fax toll-free to 1-866-678-6789

Mail to: Canada Vigilance Program

Health Canada

AL 0701C

Ottawa, ON K1A 0K9

To have postage pre-paid, download the [postage paid label](#) from the [MedEffect™ Canada Web site](#). The [Canada Vigilance Reporting Form](#) and the adverse reaction reporting guidelines may also be obtained via this Web site.

**INPUT 2**

- Why IYH? Instrument choice (enterprise risk) change public behaviour before moving to prohibition; no incidence data outside of Ontario
- there are now recent data on the prevalence of salvia that were just released in the Ontario student drug use survey (6% of students reported having used it at least once, rate higher than for ecstasy) . Bruna is preparing a short article for CMAJ with more details on it .

# NIDA INFOFACTS

www.drugabuse.gov

National Institute on Drug Abuse • National Institutes of Health • U.S. Department of Health & Human Services

## Salvia

Salvia (*salvia divinorum*) is an herb common to southern Mexico and Central and South America. The main active ingredient in salvia, salvinorin A, is a potent activator of kappa opioid receptors in the brain<sup>1,2</sup>. These receptors differ from those activated by the more commonly known opioids, such as heroin and morphine.

Traditionally, *S. divinorum* has been ingested by chewing fresh leaves or by drinking their extracted juices. Recreationally, the dried leaves of *Salvia divinorum* can be smoked as a joint, consumed in water pipes or vaporized and inhaled. Although salvia currently is not a drug regulated by the Controlled Substances Act, several states and countries have passed legislation to regulate its use.<sup>3</sup> The Drug Enforcement Agency has listed salvia as a drug of concern and is considering classifying it as a Schedule I drug, like LSD or marijuana.

### **Health/Behavioral Effects**

People who abuse salvia generally experience hallucinations or psychotomimetic episodes (a transient experience that mimics a psychosis).<sup>4,5</sup> Subjective effects have been described

as intense but short-lived, appearing in less than 1 min and lasting less than 30 min. They include psychedelic-like changes in visual perception, mood and body sensations, emotional swings, feelings of detachment, and importantly, a highly modified perception of external reality and the self, leading to a decreased ability to interact with one's surroundings.<sup>5</sup> This last effect has prompted concern about the dangers of driving under the influence of Salvinorin. The long-term effects of Salvia abuse have not been investigated systematically.

### **Extent of Use**

In 2009, NIDA's Monitoring the Future Survey of 8th, 10th, and 12th graders asked about salvia abuse for the first time 5.7 percent of high school seniors reported past year use (greater than the percent reporting ecstasy use). Although information about this drug is limited, recent salvia-related media reports and Internet traffic suggest the possibility that its abuse is increasing in the US and Europe,<sup>4</sup> likely driven by drug-related videos and information on Internet sites.<sup>3</sup> Because of the nature of the drug's effects its use may be restricted to individual experimentalists, rather than as a social or party drug.<sup>5</sup>

## Buy salvia divinorum for sale.

Welcome to Salvia.ca!

We are the exclusive destination of choice for all your salvia divinorum needs. Being a rare sage as salvia is, the demand for our products have never been higher. We offer a broad range of extract including 20x as well as a selection of dried leaves which have proven to be very popular within the salvia community. Our very rare seeds and high quality plants allow for the freshest salvia possible.

We have taken our time in developing this site for the use of everyone. We hope to make this much more than a place to buy salvia divinorum by offering interesting articles and stories from salvia users. It's our way of helping to increase the awareness of these wonderful

products. If you are new to Salvia and would like to learn more about it, check out this exelent [Salvia Resource](#)

**To order or with questions call toll free: 1-800-920-1847**

**All prices quoted are in United States Dollars (USD)**

## **Salvia Divinorum Extract 10x**

Our 10 x Salvia Divinorum Extract contains 36mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. Twice as potent as the 5x salvia extract.

- Salvia Divinorum Extract 10x, 1g \$26.62
- Salvia Divinorum Extract 10x, 3g \$66.55
- Salvia Divinorum Extract 10x, 10g \$181.50
- Salvia Divinorum Extract 10x, 25g \$326.70
- Salvia Divinorum Extract 10x, 50g \$544.50

**Buy Now**

## **Salvia Divinorum Extract 15x**

Our 15x salvia extract contains 54mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

- Salvia Divinorum Extract 15x, 1g \$36.30
- Salvia Divinorum Extract 15x, 3g \$84.70
- Salvia Divinorum Extract 15x, 10g \$235.95
- Salvia Divinorum Extract 15x, 25g \$424.71
- Salvia Divinorum Extract 15x, 50g \$707.85

[Buy Now](#)

## Salvia Divinorum Extract 20x

Our 20x extract is extremely rare and hard to find and contains 72mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

Experienced salvia users only.

**Use with caution**

- Salvia Divinorum Extract 20x, 1g \$48.40
- Salvia Divinorum Extract 20x, 3g \$108.90
- Salvia Divinorum Extract 20x, 10g \$302.50
- Salvia Divinorum Extract 20x, 25g \$550.55
- Salvia Divinorum Extract 20x, 50g \$919.60

Buy Now

## Salvia Divinorum Extract 30x

Our 30 x salvia divinorum extract contains 108mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

Experienced salvia users only.

**Use with caution**

- Salvia Divinorum Extract 30x, 1g \$65.34
- Salvia Divinorum Extract 30x, 3g \$169.40
- Salvia Divinorum Extract 30x, 10g \$435.60
- Salvia Divinorum Extract 30x, 25g \$877.25

Buy Now

## Salvia Divinorum Extract 5x

Our 5x salvia divinorum extract contains 18mg of salvinorin-a per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid.

- Salvia Divinorum Extract 5x, 1g \$13.31
- Salvia Divinorum Extract 5x, 3g \$32.67
- Salvia Divinorum Extract 5x, 10g \$93.17
- Salvia Divinorum Extract 5x, 25g \$181.50
- Salvia Divinorum Extract 5x, 50g \$326.70

## Live Salvia Divinorum Cuttings

Salvia divinorum, also known as Diviner's Sage and Sage of the Seers, is a psychoactive herb which can induce strong dissociative effects. It is a member of the Mint family.

Salvia divinorum has a long and continuing tradition of use as an entheogen by indigenous Mazatec shamans, who use it to facilitate visionary states of consciousness during spiritual healing sessions.

The plant is found in isolated, shaded, and moist plots in Oaxaca, Mexico. It grows to well over a meter in height. It has hollow square stems, large green leaves, and occasional white and purple flowers. Salvia Divinorum produces few seeds, and those that do appear seldom germinate.

Salvia prefers indirect sunlight, do not place the plant under intense sunlight. You can begin to harvest leaves when the plant is about three feet tall. The plant will grow quickly under the right conditions.

Salvia divinorum can be chewed, smoked, or taken as a tincture to produce experiences ranging from uncontrollable laughter to much more intense and profoundly altered states. The primary psychoactive constituent is a diterpenoid known as Salvinorin A.

The duration of effects is much shorter than that of other, more well-known psychedelics; the effects of smoked salvia typically last for only a few minutes. The most commonly reported after-effects include an increased feeling of insight, an improved mood, a sense of calmness, and an

increased sense of connection with nature— though, much less often, it may also cause dysphoria (unpleasant or uncomfortable mood).

Salvia divinorum is not generally understood to be toxic or addictive.

Mazatec shamans crush the leaves to extract leaf juices from about 50-200g of fresh leaves (20 to 80 leaves). They usually mix these juices with water to create an infusion or 'tea' which they drink to induce visions in ritual healing ceremonies.

Dry leaves can be smoked in a pipe or water pipe. The temperature required to release salvinorin from the plant material is quite high (about 240°C). A regular flame will work, but the direct application of a butane torch lighter, is often preferred. Many people find that untreated dried salvia leaf produces unnoticeable or only light effects.

The leaves can also be chewed; in this case they should be held in the mouth as long as possible in order to facilitate absorption of the active constituents through the oral mucosa. Chewing consumes more of the plant than smoking, and produces a longer-lasting experience.

### Diviners Sage

*Salvia divinorum*

**Uses:** Medicinal

**Duration:** Perennial (*hardy in zones 11+*)

Sacred sage of the Mazateca Indians of Mexico used to induce divinatory visions. To help find lost items, or to solve problems of a material or spiritual nature, the Mazateca Indians would chew the fresh leaves. The leaves are very bitter when chewed but are slightly more palatable taken as a cold infusion of fresh crushed leaves, or smoked. Psychotropic effects similar to mescaline are attributed to compounds called salvivorins. Prefers humid, shaded conditions and humus-rich, moist soil. Rangy plant, reaching 2m/7ft. unless pruned.

DRAFT 12  
September 1, 2010

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or Exemption Number or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drug Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

### **Supplementary Messages:**

#### ***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

***If pressed on the lack of statistics on Salvia divinorum use in Canada:***

- Health Canada is taking steps to address the paucity of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010
- It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. With respect to adverse effects, there are insufficient controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*. Based on the available evidence, Health Canada is not proceeding to regulate it as a controlled substance at this point in time.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or **salvinorin A** can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675. .

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just been released and data from the 2009 edition of CADUMS will be available in late June 2010. [need to state how these survey information will be used from a regulatory perspective]

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize any risk of similar reactions to the general population. In particular, Health Canada does not have any

information about the number of individuals in Canada using or who have used *Salvia divinorum*. [what about extrapolation from the surveys cited above?]

***If pressed on whether Health Canada has issued any kind of warning to Canadians about Salvia divinorum***

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.[this is subjective and does not give information]

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that;

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba indicate that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.

- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

Draft 16  
Sept 2010

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of January 2010 no products containing *S. divinorum* have been authorized for use by Health Canada.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling unwell, uneasy or unhappy)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (it may be mixed with other substances)
- how it is taken (e.g., chewed, swallowed or smoked)
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage

- how it interacts with other substances, including other drugs, natural health products and alcohol
- The potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “**Need More Info?**” section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Exemption Number; or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010 no products containing *S. divinorum* have been authorized by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). This is because there is not enough information available to determine whether regulation as a controlled substance is warranted. In an effort to collect more information about the use of *S. divinorum* in Canada, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS).

Data from these surveys will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient in Canada. See the **Need More Info?** section below for more information on the surveys.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, for example, can not sell to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec Indians for medicinal uses like chewing the leaves or using them to make a tea, and other purposes like smoking the leaves to induce a “mystical” or hallucinogenic experience.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

## Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding regulation of *S. divinorum* in Canada.

## Need More Info?

- Complaints about illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)

Subject Re: Final review before formal approval - SALVIA 

Good point Robin!

I'll put Sept 2010 for now but flag it so that when we are ready to release I'll make sure the proper month is listed.

Thanks

Lisa

If you would prefer to say, "As of September, 2010 . . ." I confirm that such a revision is correct. January is already soooo long ago!

Subject Final review before formal approval - SALVIA

Hello all,

I think I have been able to include all requested changes to the media lines and IYH article on Salvia. Here are the final documents for your review. Could you please send any additional comments or requested

changes to me by c.o.b Tuesday September 7.

I have made one additional change to the IYH article. I believe two of the main questions the public has about this substance are "is it safe?" and if not "what is Health Canada doing?" so to that end, I added a sentence (taken from another section of the article) to the Issue section:

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of January 2010 no products containing *S. divinorum* have been authorized for use by Health Canada.

IYH article - mark-up

[attachment "IYH Salvia\_v15 Aug 2010.doc" deleted by Robin Marles/HC-SC/GC/CA]

IYH article - clean version

[attachment "IYH Salvia divinorum\_v16 clean Sept2010.doc" deleted by Robin Marles/HC-SC/GC/CA]

In the media lines comments there was a question regarding the Raw Material Policy:

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum* , but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. - **This statement is correct.**

Media Lines - mark-up

History:  This message has been replied to.

Thank you Suzanne, Bruna and Hanan

To answer your question about why the background section is so far down in the article - we are trying to change the format of IYH articles somewhat to make them consistent with the style of information on the Consumer Safety Portal. It was suggested that the Background section be moved down in all articles because people generally want to know the Issue first, what are their potential risks second and what can they do to minimize those risks third. Then if they want they can read the rest of the information. Whenever possible we are trying to change to that format.

Subject Re: Final review before formal approval - SALVIA 

Hi Lisa,

Bruna Brands, Hanan Abramovici and myself have looked at the article and the media lines. Our comments are included in the attached.

Most of the changes are due to the fact that the results from the surveys are now known and we have started to review the information as part of our drug scheduling process. The decision has not been made yet and can't be communicated, but we can no longer say that at the present time there is not enough information for us to make a decision. Both the article and the Media lines have been amended with that consideration.

IYH Salvia divinorum\_v16 clean Sept2010 ODARS cmts.doc Media Lines\_v12 clean Sept2010ODARS cmts.doc

Thanks

Suzanne

DRAFT 12  
September 1, 2010

### Media Lines Regulatory Control of *Salvia Divinorum*

#### **Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### **Key Messages:**

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or Exemption Number or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drug Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Formatted: Font: Italic

#### **Supplementary Messages:**

##### ***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be controlled under the *Controlled Drugs and Substances Act*.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and

**Comment [S1]:** Now that we have the results from CADUMS and YSS, I don't think that this will be an issue

**Deleted:** *If pressed on the lack of statistics on *Salvia divinorum* use in Canada:*

¶  
<#>Health Canada is taking steps to address the paucity of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010¶

¶  
<#>It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.¶

¶  
**If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:** ¶

¶  
<#>The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.¶

**Formatted:** Font: Not Bold

**Deleted:** With respect to adverse effects, there are insufficient controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*. Based on the available evidence,

**Deleted:** not proceeding to regu

**Deleted:** late it as a controlled substance at this point in time

**Deleted:** .

**Formatted:** Font: Not Bold

**Deleted:** .

- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Deleted:** has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

**Deleted:** ¶

**Deleted:** ¶

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

**Deleted:** It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just been released and data from the 2009 edition of CADUMS will be available in late June 2010. [need to state how these survey information will be used from a regulatory perspective]¶

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions to the general population

**If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum***

**Deleted:** any

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

**Deleted:** In particular, Health Canada does not have any information about the number of individuals in Canada using or who have used *Salvia divinorum*. [what about extrapolation from the surveys cited above?]¶

**Background**

**Formatted:** Font: (Default) Times New Roman

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

**Deleted:** Indians

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** [this is subjective and does not give information]

Data from the 2008-2009 Youth Smoking Survey indicate that:

- 2.6% of students (grades 7-12) reported having used *Salvia divinorum* in the past year.
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year.

**Deleted:**

- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year).
- The prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that;

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## *Salvia divinorum*

Formatted: Font: Italic

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of September 2010, no products containing *S. divinorum* have been authorized for use by Health Canada.

Deleted: Januar

Deleted: y

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

Deleted:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Deleted: unwell, uneasy or unhappy

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (it may be mixed with other substances)
- how it is taken (e.g., chewed, swallowed or smoked)
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage

- how it interacts with other substances, including other drugs, natural health products and alcohol
- The potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Exemption Number; or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of September 2010 no products containing *S. divinorum* have been authorized by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, for example, can not sell to anyone under the age of 18.

**Comment [S1]:** “organic” should be removed as the “brain” is specified for hallucinogens; there is no such as thing as an “organic” function in the brain

**Deleted:** organic

**Deleted:** January

**Deleted:**

**Deleted:** This is because there is not enough information available to determine

**Deleted:** In an effort to collect more information about the use of *S. divinorum* in Canada, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS).

**Deleted:** ¶

**Deleted:** Data from these surveys will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient in Canada. See the *Need More Info?* section below for more information on the surveys

**Deleted:** ¶

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A, are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

In Canada, results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 years and older reported having used *S. divinorum* at least once in their lifetime. Youth 15-24 years of age were, however, much more likely to have ever used it than adults (7.3% vs 0.5%). Similarly, results from the 2008-2009 Youth Smoking Survey show that 5% of 15 year-olds reported using *S. divinorum* in the past year. See the **Need More Info?** section below for more information on these surveys.

**Comment [S2]:** Why is this section here? Would be better placed right after the "Issue" section.

## Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding regulation of *S. divinorum* in Canada.

## Need More Info?

- Complaints about illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.
- You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:  
Report online at the MedEffect™ Canada website at: <http://www.hc-sc.gc.ca/dhp-mps/medeff/index-eng.php>  
Call toll-free at 1-866-234-2345  
Complete a Canada Vigilance Reporting Form and either:  
Fax toll-free to 1-866-678-6789  
Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada website. History:  This message has been forwarded.

Hi there

So here is my input on the IYH and media lines; building on the comments from ODARS, which I largely agree with. I assume you have also reviewed so perhaps you can compare any comments/ thoughts with what I have compiled and edit as required. Then we should send back to Lisa Mackay ASAP as I think she wanted input by COB tomorrow (Tuesday).....

Both docs saved under PRAD/ Salvia in either IYH folder or general folder:

IYH Salvia d\_v16 + ODARS + OCS Sept 2010.doc Media Lines\_v12 ODARS + OCS Sept 2010.doc

Come see me if you have any questions

JK

DRAFT 12  
September 1, 2010

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or Exemption Number or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drug Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Formatted: Font: Italic

change to reflect decision to schedule

#### Supplementary Messages:

##### *Salvia divinorum as a controlled substance:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be controlled under the *Controlled Drugs and Substances Act*.

HC will be scheduling it now

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

We did consult as this did we not?

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 – Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and

change

**Comment [S1]:** Now that we have the results from CADUMS and YSS, I don't think that this will be an issue

**Deleted:** If pressed on the lack of statistics on *Salvia divinorum* use in Canada:¶

¶<#>Health Canada is taking steps to address the paucity of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010¶

¶<#>It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.¶

¶**If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:** ¶

¶<#>The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.¶

**Formatted: Font: Not Bold**

**Deleted:** With respect to adverse effects, there are insufficient controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*. Based on the available evidence,

**Deleted:** not proceeding to regu

**Deleted:** late it as a controlled substance at this point in time

**Deleted:** .

**Formatted: Font: Not Bold**

**Deleted:** .

- Overall risk to public health and safety posed by the substance.

moving forward as we do?

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Deleted: has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

Deleted: ¶

Deleted: ¶

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

Deleted: It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just been released and data from the 2009 edition of CADUMS will be available in late June 2010. [need to state how these survey information will be used from a regulatory perspective]¶

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions to the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

Deleted: any

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

Deleted: . In particular, Health Canada does not have any information about the number of individuals in Canada using or who have used *Salvia divinorum*. [what about extrapolation from the surveys cited above?]¶

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

Formatted: Font: (Default) Times New Roman

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Deleted: Indians

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Deleted: [this is subjective and does not give information]

Data from the 2008-2009 Youth Smoking Survey indicate that:

- 2.6% of students (grades 7-12) reported having used *Salvia divinorum* in the past year.
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year.

Deleted:

- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year).
- The prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that;

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

- lack of physical coordination
- slurred speech and awkward sentence patterns

Deleted: unwell, uneasy or unhappy

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (it may be mixed with other substances)
- how it is taken (e.g., chewed, swallowed or smoked)
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage

- how it interacts with other substances, including other drugs, natural health products and alcohol
- The potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Exemption Number; or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of September 2010 no products containing *S. divinorum* have been authorized by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering available information to determine whether regulation as a controlled substance is warranted.

*moving forward to scheduling*

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, for example, can not sell to anyone under the age of 18.

**Comment [S1]:** “organic” should be removed as the “brain” is specified for hallucinogens; there is no such as thing as an “organic” function in the brain

**Deleted:** organic

**Deleted:** January

**Deleted:**

**Deleted:** This is because there is not enough information available to determine

**Deleted:** In an effort to collect more information about the use of *S. divinorum* in Canada, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS).

**Deleted:** ¶

**Deleted:** Data from these surveys will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient in Canada. See the *Need More Info?* section below for more information on the surveys

**Deleted:** ¶

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A, are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

In Canada, results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 years and older reported having used *S. divinorum* at least once in their lifetime. Youth 15-24 years of age were, however, much more likely to have ever used it than adults (7.3% vs 0.5%). Similarly, results from the 2008-2009 Youth Smoking Survey show that 5% of 15 year-olds reported using *S. divinorum* in the past year. See the **Need More Info?** section below for more information on these surveys.

**Comment [S2]:** Why is this section here? Would be better placed right after the "Issue" section.

## Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding regulation of *S. divinorum* in Canada.

*moving forward to scheduling*

Subject Re: Fw: Final review before formal approval - SALVIA 

I will look at consolidated input tonight but I think the idea was to not be so prescriptive in the IYH just yet. I will also read text of QP as I actually don't think a QP is where we shld be announcing a policy position. If we are truly going to proceed to schedule Salvia, we shld be working on a comms plan to tell the universe as there will be Cdns who are very interested in said decision.

Stephanie, pls let Lisa Mackay know that our input will be delayed until tomorrow.

I quickly read both documents. I would suggest that the message from Health Canada should reflect the decision to schedule it under the CDSA. This is how the QP note was re-designed, so both the media lines and IYH should reflect this decision.

Subject Fw: Final review before formal approval - SALVIA

Hi there

So here is my input on the IYH and media lines; building on the comments from ODARS, which I largely agree with. I assume you have also reviewed so perhaps you can compare any comments/ thoughts with what I have compiled and edit as required. Then we should send back to Lisa Mackay ASAP as I think she wanted input by COB tomorrow (Tuesday).....

Both docs saved under PRAD/ Salvia in either IYH folder or general folder:

DRAFT 12  
September 1, 2010

## Media Lines

### Regulation of *Salvia divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: ory Control

Deleted: D

Formatted: Font: Italic

Formatted: Font: Italic

#### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or Exemption Number or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Formatted: Font: Italic

#### Supplementary Messages:

##### *Salvia divinorum* as a controlled substance:

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

Deleted: is not

Deleted: es

Deleted: a

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Deleted: federally

Comment [S1]: Now that we have the results from CADUMS and YSS, I don't think that this will be an issue

Deleted: If pressed on the lack of statistics on *Salvia divinorum* use in Canada:¶

¶<#>Health Canada is taking steps to address the paucity of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010¶

¶<#>It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.¶

¶If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey: ¶

¶<#>The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.¶

Formatted: Font: Not Bold

Deleted: With respect to adverse effects, there are insufficient controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*. Based on the available evidence,

Deleted: not proceeding to regu

Deleted: controlled

Deleted: late it as a controlled substance at this point in time

Deleted: .

Formatted: Font: Not Bold

Deleted: .

#### Questions and Answers:

#### Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

#### Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

#### Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

#### Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and

- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Deleted:** has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

**Deleted:** ¶

**Deleted:** ¶

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

**Deleted:** It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just been released and data from the 2009 edition of CADUMS will be available in late June 2010. [need to state how these survey information will be used from a regulatory perspective]¶

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

**Deleted:** any

**If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum***

**Deleted:** to

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

**Deleted:** . In particular, Health Canada does not have any information about the number of individuals in Canada using or who have used *Salvia divinorum*. [what about extrapolation from the surveys cited above?]¶

**Background**

**Formatted:** Font: Not Bold

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

**Deleted:** .

**Formatted:** Font: Not Bold

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

**Deleted:**

**Formatted:** Font: Not Bold

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

**Formatted:** Font: (Default) Times New Roman

**Deleted:** Indians

**Deleted:** While some

Some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine; however this has not been confirmed through scientific study.

**Deleted:** phencyclidine,

**Deleted:** the overall experience appears to be quite unique. [this is subjective and does not give information]

Data from the 2008-2009 Youth Smoking Survey indicate that:

**Comment [HC2]:** I have suggested some text to respond to the previous comment re the text being subjective and not providing information as I agree that the previous sentence was not helpful. Alternatively, the sentence could just be removed altogether as it really does not add much at this point.....

- 2.6% of students (grades 7-12) reported having used *Salvia divinorum* in the past year.

**Deleted:** .

- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Formatted: Indent: Left: 0 cm, Hanging: 1.27 cm

Deleted:

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Deleted: .

Deleted: T

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

*Salvia divinorum*

Formatted: Font: Italic

Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of January 2010, no products containing *S. divinorum* have been authorized for sale by Health Canada.

Comment [S1]: September?

Comment [S2]: Is it for "use" or for "sale"?

Comment [HC3]: Agreed by OCS. This definitely should read "for sale", not use.

Deleted: use

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

Deleted:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Deleted: unwell, uneasy or unhappy

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products may contain *S. divinorum* mixed with other substances)
- how it is taken, e.g., whether the product is chewed, swallowed or smoked
- the user's mood and expectations

Deleted: it

Deleted: may be

Deleted: (

Deleted: )

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or whether it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of its hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada unless they have been reviewed and approved by Health Canada and in the case of NHPs, labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number; or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010, no products containing *S. divinorum* or salvinorin A have been authorized for sale by Health Canada. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, e.g., it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

Deleted: T

Comment [HC4]: Just think the whole sentence about “when manufactured..represented for use in modifying organic functions...” sentence is very long and technical, and certainly not at a Great 8 reading level. And since the sentence I have suggested is similar to text in the media lines, I think we can run with it here.

Comment [S5]: “organic” should be removed as the “brain” is specified for hallucinogens; there is no such as thing as an “organic” function in the brain

Deleted: When

Deleted: is

Deleted: manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying

Deleted: organic

Deleted: functions in the brain, it

Deleted: s

Comment [S6]: September?

Deleted:

Deleted: All

Comment [HC7]: Just trying to make this more consistent with media lines....

Deleted: are

Deleted: This is because there is not enough information available to determine

Deleted: In an effort to collect more information about the use of *S. divinorum* in Canada, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS).

Deleted: Data from these surveys will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient in Canada. See the *Need More Info?* section below for more information on the surveys

Deleted:

Formatted: Font: Italic

Deleted: for example, can not sell

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A, are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

In Canada, results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 years and older reported having used *S. divinorum* at least once in their lifetime. Youth 15-24 years of age were however much more likely to have ever used it than adults (7.3% vs 0.5%). Similarly, results from the 2008-2009 Youth Smoking Survey show that 5% of 15 year olds reported using *S. divinorum* in the past year.

See the Need More Info? section below for more information on these surveys.

### Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding the regulation of *S. divinorum* in Canada.

## ***Salvia divinorum***

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of September 2010, no products containing *S. divinorum* have been authorized for use by Health Canada.

Deleted: January

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is known to have physical and mental effects. [see list below]

The leaves of this plant have been used traditionally by the Mazatec Indians for medicinal (chewing the leaves or using them to make a tea) and other purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience).

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

### **Risks Associated with the Use of *Salvia divinorum***

The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

Deleted:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination; and
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- The potential of *S. divinorum* to produce physical dependence and/or addiction.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Exemption Number; or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of September 2010, no products containing *S. divinorum* have been authorized by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is continuing to analyze information regarding *S. divinorum* as it becomes available in order to determine the most appropriate way of managing the potential risks associated with this substance. In an effort to collect more information about the use of *S. divinorum* in Canada, questions relating to it were included in the 2008-2009 Youth

History:  This message has been replied to.

Hi Stephanie,

Sorry for the delay in getting back to you. I was away on holidays. Here is the ROD for the last meeting.

CSS-WG Aug 2010 Meeting RODt.doc

Here is the info from Robin - he sent a detailed email that I have attached below.

Draft Salvia Divinorum IAS\_July 12 2010 ed by NHPD RMarles.doc

Regarding the question of other uses of *Salvia divinorum*, here is what I was able to find:

*Salvia divinorum* has traditional medicinal uses among the native peoples of Mexico, e.g. for the treatment of topical ulcers of the feminine organs (Díaz 1976), to help normalize eliminatory functions (diarrhoea/constipation and urination), anemia, headaches, rheumatism, and alcohol addiction, in addition to its use as a hallucinogen in divination rituals (Valdés et al. 1983). The method of preparation is always an infusion of 4 to 120 pairs (10 to 300 g) of fresh leaves crushed and added to boiling water (a tea) -- low doses of fresh or dried leaves for medicinal purposes and doses of 50+ grams of only fresh leaves for divination/hallucination (Valdés et al. 1983).

There is no record in the scientific literature of a history of use of *Salvia divinorum* as an incense. Burning was not an established method of preparation in traditional uses as a medicine or as a hallucinogenic.

There are a few herbs where burning the leaves produces a very characteristic fragrance (e.g. cured tobacco, *Artemisia*, cedar). However, most aromatic plants lose their characteristic fragrance when burned and simply smell like burned leaves. Gum-resins from trees, e.g. frankincense, myrrh, and copal, are much more common incense ingredients because they gradually release their volatile oils into the smoke (Simpson and Ogorzaly 2001).

Therefore, I believe that the production of "incense" from *Salvia divinorum* leaves or extracts is a recent invention to try to avoid compliance and enforcement actions. Nevertheless, it may be difficult to argue in court that, in the absence of any claims regarding hallucinogenic or other actions in humans, use as incense is not "legitimate" even if there is no history of such use and it just smells like burned leaves.

With respect to the sale of *Salvia divinorum* as a cultivated plant in Canada, yes, it is available from legitimate Canadian garden supply companies, e.g.,

- RICHTERS HERBS, 357 Highway 47, Goodwood, ON L0C 1A0 Canada, Tel. +1.905.640.6677 Fax. +1.905.640.6641, <http://www.richters.com/>. Note the promotional statements explicitly related to its use as a hallucinogen in the attached web site pdf.

Richters Product Listing *Salvia divinorum*.pdf

It is also available from more questionable suppliers, such as:

- Vancouver Seed Bank <http://www.vancouverseedbank.ca/catalog/index.php?cPath=90>

*Salvia divinorum* Vancouver Seed Bank.pdf

and

- <http://www.Salvia.ca>

*Salvia Divinorum* from *Salvia ca*.pdf

Bruna's info from NIDA can be found here:  
<http://drugabuse.gov/infofacts/salvia.html>

International Use? I imputed the CND data in the text from the CADUMS and the OSDUHS but I don't have any other info.

Let me know if there is anything else you need.

Subject CSS-WG re *Salvia*

Hi Tiffany,

I was just wondering if you would be sending out a Record of Decision or minutes from the last CSS-WG meeting re: *Salvia divinorum*. There were a few items that members were going to look into, or revisions which they were going to pass along. I wasn't sure if you would be receiving these items and passing them along, or if I should contact the members directly?

According to my notes:

- Robin has revisions re: Natural Health Product Regs

- ODARS may have stats on international use
- Bruna had a NIDA publication re: Salvia and its effects
- Evelyn would provide some info on the status decision of cyclazocine, if available

Thanks,

Stephanie

[DD/MM/2010]

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

1

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product licence application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product licence application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

Deleted: of other

Deleted: m

Deleted: p

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances, substances that are traditional medicines or that are homeopathic medicines, and that none of the ingredients are substances set out on Schedule 2 which is a list of excluded substances, e.g. any substance listed on Schedules I to V of the Controlled Drugs and Substances Act. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 and thus Schedule F to the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it and manufactured, sold or represented for that purpose meet the definition of an NHP.

Deleted: whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold

Deleted: To be considered a NHP, no direct health claims need to be made regarding the substance

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are

illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

restrictive drug schedule, and includes “substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

---

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

#### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

#### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material,

but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of

<sup>6</sup> Ott J. Ethnopharmacognosy and human pharmacology of *Salvia divinorum* and salvinorin A. *Curare*. 1995 18: 103-129. Unofficial transcription available online. URL <http://www.sagewisdom.org/ott2.html>

<sup>7</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>17</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with

that of other KOR agonists such as pentazocine.<sup>19</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

<sup>24</sup> Sheffler DJ & Roth BL. Salvinorin A: the ‘magic mint’ hallucinogen finds a molecular target in the kappa opioid receptor. *Trends Pharmacol Sci.* 2003 Mar;24(3):107-109.

<sup>25</sup> Prisinzano TE. Natural products as tools for neuroscience: discovery and development of novel agents to treat drug abuse. *J Nat Prod.* 2009 Mar 27;72(3):581-7.

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also

be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were

<sup>33</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

<sup>38</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

<sup>39</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

<sup>44</sup> Turner DM. *Salvinorin - The Psychedelic Essence of Salvia Divinorum*. Panther Press, San Francisco, CA 1996.

included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9

2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the

drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

<sup>50</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>51</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. *Planta Med* 2007 Jun;73:1039-1046.

<sup>53</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction.* 102, 823-824.

substantiate this finding.

s.21(1)(a)  
s.21(1)(b)

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting. Considering also the limited population exposure information, it is not possible to adequately characterize the risk to the general population.

Deleted: Although

Deleted: as a hallucinogen

Deleted: , it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being

---

<sup>56</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>57</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

**s.21(1)(a)**  
**s.21(1)(b)**

widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available,

Deleted: ¶

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 8. RECOMMENDATIONS

s.21(1)(a)  
s.21(1)(b)

## 9. CONSULTATIONS

<sup>58</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

Subject CSS-WG Meeting Agenda & ROD 

Hi everyone,

Please find attached the draft agenda for the CSS-WG meeting on **Wednesday September 15th from 10-11:30 in Rm 405A, 123 Slater Street.**

I have also attached the ROD from the meeting in August and supporting documentation for your review. Thanks very much to Robin for providing the revisions for the IAS and the background information on Salvia - much appreciated!

Should you wish to participate in the meeting via teleconference please give me advance notice (1 day) so that I can make arrangements..

Thanks,  
Tiffany  
946-3590

**Draft Agenda - September 15th:**

- 1- Members' introduction
- 2- Approval of Agenda
- 3 - Approval of ROD from August 2010
  - recommendation on scheduling Salvia
- 4- Update on CDSA Scheduling Process
  - ADM briefing scheduled? (Jocelyn)
- 5- Update
  - updates on any emerging issues relevant to the WG's activities
- 6- Next steps i.e next meeting scheduled for October 13th

**August 2010 ROD:**

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

Deleted: or not they

4. CONTEXT

Deleted: 3

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

Deleted: alternative to street drugs

Deleted: , and

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Deleted: (a

Deleted: that

Deleted: ).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Deleted: should be restricted from over-the-counter use. Should any such unauthorized health products be found on the Canadian market, they should be removed from sale. Such products

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### 4.1 Relevant Legislative Frameworks in Canada

##### 4.1.1 Food and Drug Regulations (under the Food and Drugs Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

Deleted: 3

The Natural Health Products Regulations (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada, further to the submission of a product licence application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product licence application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

Deleted: came into force in January 2004

Deleted: contain a product licensing system that

Deleted: s

Deleted: m

Deleted: p

Deleted: requirements.

Deleted: whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

Deleted: To be considered a NHP, no direct health claims need to be made regarding the substance

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances, substances that are traditional medicines or that are homeopathic medicines, and that none of the ingredients are substances set out on Schedule 2 which is a list of excluded substances, e.g. any substance listed on Schedules I to V of the Controlled Drugs and Substances Act. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 and thus Schedule F to the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore, products containing it and manufactured, sold or represented for that purpose meet the definition of an NHP.

Deleted: such

Deleted: would be considered

Deleted: s

Deleted: anuar

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are

illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

- Formatted: Bullets and Numbering

#### 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most

restrictive drug schedule, and includes “substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### Belgium

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

Deleted: which

### Denmark

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

Deleted: prohibited

Deleted: by adding them

### Germany

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### Italy

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### Japan

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e., beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

Deleted: m.  
Deleted: along with a long list of other allegedly toxic herbs.

**Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

**United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States Controlled Substances Act although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### North Carolina

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### Tennessee

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of

various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>11</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>17</sup>

**Deleted:** Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>12</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective κ-opioid receptor (KOR) agonist.<sup>13</sup>

**Deleted:** is

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with

that of other KOR agonists such as pentazocine.<sup>19</sup>

**4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses**

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant in order to utilize its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also

be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were

included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined *Salvia* for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table.

 A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including pricking of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>41</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>42</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.¶  
 ¶  
 In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>43</sup> ¶  
 It should be noted that alcohol and general depression were the main confounders in this case. ¶  
 After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as ¶ a Schedule I controlled substance along with other hallucinogenic substances.¶

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the

drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting. Considering also the limited population exposure information, it is not possible to adequately characterize the risk to the general population.

## 9. CONSULTATIONS

<sup>58</sup> Munro, T. The Chemistry of Salvia divinorum. PhD dissertation, 2006. Accessed from:  
<http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

The various modes of administration of *S. divinorum* lead to the variable onset and duration of its effects. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>1</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>2</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>3</sup>

---

Page 12: [2] Deleted STCHANDL 2010-07-05 1:37:00 PM

the rewarding and aversive

---

Page 12: [4] Deleted STCHANDL 2010-07-05 1:38:00 PM

Another aspect of the *S. divinorum* abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and it is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling this substance quite affordable and attractive. Originally, t

## **6. Next Steps**

The next meeting scheduled for Wednesday, September 15<sup>th</sup> from 10-11:30am in Room 405A.

### **Actions:**

- Tiffany to circulate the invitation, agenda and ROD for the next meeting.

**PUBLICATION:** Le Soleil  
**DATE:** 2010.08.18  
**SECTION:** Actualités  
**PAGE:** 2 / FRONT  
**BYLINE:** Fortin, Pierre-Olivier  
**WORD COUNT:** 342  
**CIRCULATION:** 81820

## Attention à l'ecstasy "légale"

On l'appelle "miaow miaow" ou "m-cat" parce qu'elle provient du khat, une plante africaine. En dépit de son surnom sympathique, des personnes sont mortes en Europe après avoir consommé de la méphédronne. Une femme qui s'en serait procuré en vente libre à Québec et qui a été sévèrement intoxiquée, un premier cas au Québec, a incité la santé publique à faire une mise en garde. La substance est consommée pour ses effets euphorisants semblables à ceux de l'ecstasy, "pour être de bonne humeur, pour passer la nuit debout", explique le Dr Pierre Auger, **médecin-conseil** à la Direction de **santé** publi- que. Cette drogue est toutefois considérée comme "très dangereuse" par l'organisme, qui conseille de l'éviter.

"C'est considéré comme une substance moins puissante que l'ecstasy ou les amphétamines. Certains n'ont presque pas d'effets secondaires; pour d'autres, ils sont importants : nausée, paranoïa, convulsions, coma, atteinte musculaire avec insuffisance rénale", cite le Dr Auger.

Les effets à long terme sont méconnus parce que la substance est sur le marché depuis trop peu de temps. Il est toutefois possible que cette drogue entraîne des dépressions majeures chez certains, des hallucinations, et provoque de la dépendance. Des personnes qui en ont consommé sont décédées en Suède et en Grande-Bretagne.

A Québec, une jeune femme a été hospitalisée aux soins intensifs après avoir consommé de la méphédronne. Il s'agit du premier cas rapporté au Québec. "Cette substance est faussement vendue comme étant un produit naturel et légal, utilisé notamment comme engrais, selon les commerçants", stipule le communiqué de presse publié par la santé publique. La méphédronne est illégale dans plusieurs pays, alors qu'il s'agit d'une substance contrôlée au Canada.

Il a été impossible de savoir, hier, où la jeune femme s'était procuré la drogue, pas plus que le nom de la boutique où elle est prétendument vendue au public. L'agence précise qu'elle est aussi vendue sur le Web. Effectivement, il semble assez facile d'en commander sur les sites qu'a consultés Le Soleil.

La santé publique a contacté la police de Québec, qui a ouvert une enquête.

pofortin@lesoleil.com

*Salvia divinorum* has traditional medicinal uses among the native peoples of Mexico, e.g. for the treatment of topical ulcers of the feminine organs (Díaz 1976), to help normalize eliminatory functions (diarrhoea/ constipation and urination), anemia, headaches, rheumatism, and alcohol addiction, in addition to its use as a hallucinogen in divination rituals (Valdés et al. 1983). The method of preparation is always an infusion of 4 to 120 pairs (10 to 300 g) of fresh leaves crushed and added to boiling water (a tea) -- low doses of fresh or dried leaves for medicinal purposes and doses of 50+ grams of only fresh leaves for divination/hallucination (Valdés et al. 1983).

There is no record in the scientific literature of a history of use of *Salvia divinorum* as an incense. Burning was not an established method of preparation in traditional uses as a medicine or as a hallucinogenic.

There are a few herbs where burning the leaves produces a very characteristic fragrance (e.g. cured tobacco, *Artemisia*, cedar). However, most aromatic plants lose their characteristic fragrance when burned and simply smell like burned leaves. Gum-resins from trees, e.g. frankincense, myrrh, and copal, are much more common incense ingredients because they gradually release their volatile oils into the smoke (Simpson and Ogorzaly 2001).

Therefore, I believe that the production of "incense" from *Salvia divinorum* leaves or extracts is a recent invention to try to avoid compliance and enforcement actions. Nevertheless, it may be difficult to argue in court that, in the absence of any claims regarding hallucinogenic or other actions in humans, use as incense is not "legitimate" even if there is no history of such use and it just smells like burned leaves.

With respect to the sale of *Salvia divinorum* as a cultivated plant in Canada, yes, it is available from legitimate Canadian garden supply companies, e.g.,

- RICHTERS HERBS, 357 Highway 47, Goodwood, ON L0C 1A0 Canada, Tel. +1.905.640.6677 Fax. +1.905.640.6641, <http://www.richters.com/>. Note the promotional statements explicitly related to its use as a hallucinogen in the attached web site pdf.

**Diviners Sage**  
*Salvia divinorum*  
**Uses:** Medicinal

**Duration:** Perennial (*hardy in zones 11+*)

Sacred sage of the Mazateca Indians of Mexico used to induce divinatory visions. To help find lost items, or to solve problems of a material or spiritual nature, the Mazateca Indians would chew the fresh leaves. The leaves are very bitter when chewed but are slightly more palatable taken as a cold infusion of fresh crushed leaves, or smoked. Psychotropic effects similar to mescaline are attributed to compounds called salvivorins. Prefers humid, shaded conditions and humus-rich, moist soil. Rangy plant, reaching 2m/7ft. unless pruned.

Salvia products

## Our Products

- Salvia Extract
- Salvia Leaves
- Wild Dagga
- Kratom
- Amanita Muscaria

## Buy salvia divinorum for sale.

Welcome to Salvia.ca!

We are the exclusive destination of choice for all your salvia divinorum needs. Being a rare sage as salvia is, the demand for our products have never been higher. We offer a broad range of extract including 20x as well as a selection of dried leaves which have proven to be very popular within the salvia community. Our very rare seeds and high quality plants allow for the freshest salvia possible.

We have taken our time in developing this site for the use of everyone. We hope to make this much more than a place to buy salvia divinorum by offering interesting articles and stories from salvia users. It's our way of helping to increase the awareness of

products. If you are  
new to Salvia and  
would like to learn  
more about it, check  
out this exelent

**All prices quoted are in United States Dollars (USD)**

## **Salvia Divinorum Extract 10x**

Our 10 x Salvia Divinorum Extract contains 36mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. Twice as potent as the 5x salvia extract.

- Salvia Divinorum Extract 10x, 1g \$26.62
- Salvia Divinorum Extract 10x, 3g \$66.55
- Salvia Divinorum Extract 10x, 10g \$181.50
- Salvia Divinorum Extract 10x, 25g \$326.70
- Salvia Divinorum Extract 10x, 50g \$544.50

**Buy Now**

## **Salvia Divinorum Extract 15x**

Our 15x salvia extract contains 54mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

- Salvia Divinorum Extract 15x, 1g \$36.30
- Salvia Divinorum Extract 15x, 3g \$84.70
- Salvia Divinorum Extract 15x, 10g \$235.95
- Salvia Divinorum Extract 15x, 25g \$424.71
- Salvia Divinorum Extract 15x, 50g \$707.85

**Buy Now**

## Salvia Divinorum Extract 20x

Our 20x extract is extremely rare and hard to find and contains 72mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

Experienced salvia users only.

**Use with caution**

- Salvia Divinorum Extract 20x, 1g \$48.40
- Salvia Divinorum Extract 20x, 3g \$108.90
- Salvia Divinorum Extract 20x, 10g \$302.50
- Salvia Divinorum Extract 20x, 25g \$550.55
- Salvia Divinorum Extract 20x, 50g \$919.60

**Buy Now**

## Salvia Divinorum Extract 30x

Our 30 x salvia divinorum extract contains 108mg of pure salvinorin-A per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid. **This dosage has been described as very potent, and we recommend that you exercise caution when using this product.**

Experienced salvia users only.  
**Use with caution**

- Salvia Divinorum Extract 30x, 1g \$65.34
- Salvia Divinorum Extract 30x, 3g \$169.40
- Salvia Divinorum Extract 30x, 10g \$435.60
- Salvia Divinorum Extract 30x, 25g \$877.25

**Buy Now**

## Salvia Divinorum Extract 5x

Our 5x salvia divinorum extract contains 18mg of salvinorin-a per gram of extract which is extracted from the plant and then redeposited back onto dried leaves. Our skilled chemists use a standardized method, which costs a little more than non-standardized methods, but means you will find no extra plant matter which can be harmful to your lungs. Salvia Extract is not a liquid.

- Salvia Divinorum Extract 5x, 1g \$13.31
- Salvia Divinorum Extract 5x, 3g \$32.67
- Salvia Divinorum Extract 5x, 10g \$93.17
- Salvia Divinorum Extract 5x, 25g \$181.50
- Salvia Divinorum Extract 5x, 50g \$326.70

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

Because of its hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of **DATE** 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

#### **Background**

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Young adults, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

#### **Health Canada's Role**

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding the regulation of *S. divinorum* in Canada. Health Canada also continues to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

### Need More Info?

- Complaints about the illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.

DRAFT 13  
September 16, 2010

## Media Lines *Salvia divinorum*

### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

### Supplementary Messages:

#### *Salvia divinorum as a controlled substance:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

This is the only ~~the~~ past that I have concerns with.  
← reversed

Long Term?  
This applies to long term effects.  
only does it not.

Based on comments and info reviewed, we know the short term effects may  
be listed in the IYH. As the ESS-WG stated ~~it~~ s. divinorum acts in similar  
fashion as LSD, and it is mostly the long term effects that are unknown ~~and~~  
of flashbacks? ~~There~~

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

#### Questions and Answers:

##### **Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

##### **Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

##### **Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

##### **Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Daniel,

Here is the final drafts of the Salvia MLs and IYH before formal approvals. I have looked over both documents and do not have any additional comments.

Stephanie

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of **MONTH** 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

Because of its hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of **DATE** 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

#### **Background**

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Young adults, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

#### **Health Canada's Role**

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding the regulation of *S. divinorum* in Canada. Health Canada also continues to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

### Need More Info?

- Complaints about the illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.
- You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:  
Report online at the MedEffect™ Canada website at: <http://www.hc-sc.gc.ca/dhp-mps/medeff/index-eng.php>  
Call toll-free at 1-866-234-2345  
Complete a Canada Vigilance Reporting Form and either:  
Fax toll-free to 1-866-678-6789  
Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9  
To have postage pre-paid, download the postage paid label from the MedEffect™ Canada website. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this website at : [http://www.hc-sc.gc.ca/dhp-mps/medeff/report-declaration/ar-ei\\_form-eng.php](http://www.hc-sc.gc.ca/dhp-mps/medeff/report-declaration/ar-ei_form-eng.php)

DRAFT 13  
September 16, 2010

**Media Lines**  
***Salvia divinorum***

**Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

**Key Messages:**

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

**Supplementary Messages:**

***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

#### Questions and Answers:

##### **Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

##### **Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

##### **Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

##### **Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

History: This message has been replied to.

I presume you have both reviewed. Pls let me know your findings and whether we are OK with this version. It will be good to have this doc finally out there.....that said, I would like to be sure there is consistency with the QP on salvia (I suggested changes to Diane btw as I just thought it was premature for us to be so definitive on our policy position in an anticipatory QP) and with the discussions of the CSS-WG.....

Pls let me know as we should try to observe Lisa's timelines.

Subject Re: SALVIA - IYH & Media lines 

Hi Lisa,

OCS has no other comments with regard to the IYH, but has one minor change to the MLs (which probably won't require another round of consultations?).

Subject SALVIA - IYH & Media lines

DRAFT 13  
September 16, 2010

**Media Lines**  
***Salvia divinorum***

**Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

**Key Messages:**

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

**Supplementary Messages:**

***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

### Questions and Answers:

#### **Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

#### **Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

#### **Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

#### **Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and,
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

DRAFT 13  
September 16, 2010

### Media Lines *Salvia divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential long-term effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

**Comment [S1]:** Given that the IYH lists numerous effects of Salvia, the addition of the word 'long-term' seems more consistent

#### Supplementary Messages:

##### ***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

Deleted: to
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. Deleted: its
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

**Supplementary Messages:**

***Salvia divinorum as a controlled substance:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

#### Questions and Answers:

##### **Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*.

Deleted: n

##### **Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

##### **Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

##### **Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and,
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

Because of its hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of **December** 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute,

import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding the regulation of *S. divinorum* in Canada. Health Canada also continues to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

## Need More Info?

- Complaints about the illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.
- You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:  
Report online at the MedEffect™ Canada website at: <http://www.hc-sc.gc.ca/dhp-mps/medeff/index-eng.php>  
Call toll-free at 1-866-234-2345  
Complete a Canada Vigilance Reporting Form and either:

**Response to Docket # 10-122057-968**

**s.19(1)**

To: [REDACTED]

Dear [REDACTED]

I am writing in response to your email enquiry dated October 6, 2010, in which you have requested information concerning the legal status of Salvia.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). However, when *S. divinorum* is sold or marketed to modify brain function (such as for use as a hallucinogen), it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). It is illegal to manufacture, sell or provide natural health products without their being authorized by Health Canada prior to sale. As of October 2010 no such products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale.

*Salvia divinorum* products that are not in compliance with the NHPR may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Health Canada is currently reviewing all the available information regarding *Salvia divinorum* to determine whether it should be regulated under the CDSA.

Please do not hesitate to contact me should you have any further questions.

Sincerely,

Jocelyn Kula  
A/Director  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate  
Healthy Environments and Consumer Safety Directorate  
(613) 952-2177

**Subject:** URGENT Follow-up - Salvia (Canadian Press)

For your review,

I have pulled what I can for these. I have French from 8-10 so can you pass this to OCS and HPFB in the morning when you get in. I am not sure we will be able to make this deadline, especially if we have to draft new responses.

Context: Every story I've read about this has said that salvia divinorum is perfectly legal and has gone on to quote a Health Canada official saying something to the effect that there's nothing the government can do to regulate salvia until there's more research or evidence of abuse. Many stories quote the police saying there's nothing they can do because it's legal. I've seen it openly for sale in head shops a stone's throw from Parliament Hill as recently as yesterday. As recently as today, I've seen websites, some based in Canada, offering this stuff for sale online. Yet your Q1 answer says it's illegal to sell it. So . . .

**Q1) Is this a recent change? Something to do with changes to the natural health products legislation?**

A1) For OCS/HPFB input? [Suggest: There have been no recent changes to the natural health products legislation.]

**Q2) Why isn't the law being enforced?**

A2) The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

*Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q3) Why do police seem unaware that they can, in fact, do something about the sale of salvia?**

A3) For OCS input?

**Q4) I assume from A1 that while it's illegal to sell products containing salvia divinorum or salvinorin A, it's not illegal to possess it or use it? That any regulation of use and possession would need to be done under the Controlled Substances Act?**

A4) See A2.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**To:** Christelle Legault  
**Subject:** RE: Health Canada - Salvia

Thanks for all that information. Your answer to Q1 raises a couple more questions though, which I hope you can answer by noon tomorrow, since I have to write this tomorrow (sorry!).

Every story I've read about this has said that salvia divinorum is perfectly legal and has gone on to quote a Health Canada official saying something to the effect that there's nothing the government can do to regulate salvia until there's more research or evidence of abuse. Many stories quote the police saying there's nothing they can do because it's legal. I've seen it openly for sale in head shops a stone's throw from Parliament Hill as recently as yesterday. As recently as today, I've seen websites, some based in Canada, offering this stuff for sale online. Yet your Q1 answer says it's illegal to sell it. So. . .

- 1) Is this a recent change? Something to do with changes to the natural health products legislation?
- 2) Why isn't the law being enforced?
- 3) Why do police seem unaware that they can, in fact, do something about the sale of salvia?
- 4) I assume from A1 that while it's illegal to sell products containing salvia divinorum or salvinorin A, it's not illegal to possess it or use it? That any regulation of use and possession would need to be done under the Controlled Substances Act?

Sorry for the new questions but I confess the A1 answer kinda threw me for a loop. Not at all what I was expecting, given everything I'd read about the legality of salvia in Canada up to now.

Thanks again for your help.

Joan

s.19(1)

**From:** Christelle Legault [mailto:christelle.legault@hc-sc.gc.ca]  
**Sent:** October 14, 2010 5:32 PM  
**To:** [REDACTED]  
**Subject:** Health Canada - Salvia

Hi [REDACTED]

As requested, please find below information in response to your questions regarding Salvia.

\*\*\*\*\*

**Q1 - What is the latest update on Salvia?**

A1 - Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions. Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.

**Q2 - What does Health Canada need (in terms of evidence) to make a decision on whether it should be listed as a controlled substance?**

A2 - A controlled substance is any type of drug that the federal government has categorized as having a higher-than-average potential for abuse or addiction. Such drugs are divided into categories based on their potential for abuse or addiction. Controlled substances range from illegal street drugs to prescription medications.

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted.

These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);

- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control;

**Q3 - Is Health Canada waiting for people to write in and complain? Are there any studies on this currently under way? Are there any pro-active steps being taken to come to a conclusion? Is Health Canada conducting research or aware of any research taking place?**

A3 - Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Health Canada is not aware of any groups specifically carrying out research on *S. divinorum*. It is however, continuing to collect and study information about the plant as it becomes available, and will consider this information as it moves forward with its scheduling assessment.

***With respect to Salvia being examined by the Canadian Alcohol and Drug Use Monitoring Survey 2009:***

Health Canada is monitoring the use of this substance, and in fact the release of Canadian Alcohol and Drug Use Monitoring Survey 2009 marks the first reporting of the prevalence of use of *Salvia* among the Canadian population. Among Canadians aged 15 years and older, the prevalence of lifetime use of *Salvia* was 1.6% and past year use was 0.2%. When examined by age group only lifetime use can be released due to the small numbers of Canadians reporting the use of this substance. Among youth (15 to 24 years) 7.3% reported lifetime use and only 0.5% of adults (25 years and older) reported having ever used this substance. Because this is a relatively new substance, Health Canada will be closely monitoring its use over the next years.

hi both

need quick reply before 9:30 today for MO daily call -- per trail below and Q from Jesse ---

Can we confirm -- if the products containing these substances (*S.divinorum* and/or *salvinorin*) have

always been illegal (at least in the recent past). This isn't a change, right?

I am quite certain the reply is yes, but ask for confirmation.

Thank you,  
Stephanie

Canada

Thanks, Christine - I was just looking at these.

While the articles make it sound like this is a new prohibition, my understanding is that products containing these substances have always been illegal (at least in the recent past). This isn't a change, right?

The Canadian Press

**Sales of hallucinogenic salvia no longer legal in Canada**

OTTAWA \_ Canada is no longer a safe legal haven for salvia  
divinorum, the potent hallucinogenic plant that is sold openly  
online and in head shops across the country.

Yet no one seems aware of the law and \*\*>Health Canada<\*\* is not  
enforcing it.

Websites and shopkeepers are still advertising the plant as a  
perfectly legal head trip for Canadians eager to join the thousands  
of ``pschonauts" who've posted videos of their psychedelic salvia  
voyages on YouTube.

An estimated 1.6 per cent of Canadians aged 15 or older have  
already taken at least one ride on salvia, according to the 2009  
Canadian Alcohol and Drug Use Monitoring Survey, the first to

measure use of the plant.

For those aged 15-24, the number rises to 7.3 per cent.

Yet the federal government says products containing salvia divinorum and its active ingredient, salvinorin A, are considered natural health products and, as such, must be authorized by \*\*>Health Canada<\*\* before they can be sold.

"It is illegal to sell NHPs (natural health products) in Canada unless they have been reviewed by \*\*>Health Canada<\*\* and authorized for sale," Christelle Legault, a spokesperson for \*\*>Health Canada<\*\*, told The Canadian Press in an email.

"To date, \*\*>Health Canada<\*\* has not licensed for sale any drug or NHP which contains salvia as an ingredient."

Legault added: "The illegal sale of products containing S. divinorum and/or salvinorin A may be subject to compliance and enforcement action under the Food and Drugs Act."

This comes as news to head shops that are openly selling vials of salvia extract \_ for \$20 to \$80 per gram, depending on the potency \_ within spitting distance of Parliament Hill.

One shopkeeper, who asked not to be identified, said he's had no notification that the plant, also known as diviner's sage and magic mint, can no longer be legally sold in Canada. He said he purchases the extract from a Canadian supplier.

It's news to the police as well, who've complained in the past that their hands are tied when it comes to salvia, which has been known to produce some adverse reactions, including one case reported by \*\*>Health Canada<\*\* in 2006 in which a teenage boy became incoherent and suicidal and threatened to kill police officers.

"Until the government makes it illegal, there's nothing we can do about it," said Robin Percival, communications strategist for drugs and organized crime at RCMP national headquarters.

Informed that \*\*>Health Canada<\*\* says it is, in fact, illegal to sell salvia without authorization under the Natural Health Products Regulations, Percival said: "I don't think we have any jurisdiction there."

Indeed, it would appear that enforcement of the regulations is entirely up to \*\*>Health Canada<\*'s Health Products and Food Branch Inspectorate.

Asked why \*\*>Health Canada<\*\* has not stopped the illegal sale of salvia, department spokesman Gary Holub said complaints can be referred to the inspectorate by calling 1-800-267-9675.

However, an open letter from the inspectorate to "all interested parties" on Aug. 27 suggests the inspectorate has not yet really begun in earnest to enforce the Natural Health Products Regulations.

The letter recounts that the regulations came into force in 2004. Due to the large backlog of products that needed to be assessed for safety and quality before they could be licensed by \*\*>Health Canada<\*\*, suppliers were given until June 2008 to submit applications for licensing.

It appears the process took longer than expected and only now is the inspectorate preparing to actually enforce the regulations.

The letter advises that a new compliance and enforcement policy has now been adopted, which is to be fully implemented in February. In the meantime, suppliers are being given a six-month transition period during which those who've taken steps to become compliant and have made a submission for licensing will be "considered a lower priority for enforcement, unless a risk to health or additional non-compliances are identified."

The chances of salvia ever receiving \*\*>Health Canada<\*\*\*'s seal of approval seem slim, given the department's dim view of the product.

"Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body and its impact on physical and mental functions," said department spokesperson Legault.

Indeed, she said \*\*>Health Canada<\*\*\* is currently reviewing available information about the plant to determine whether it should be included in the Controlled Drugs and Substances Act, which regulates or bans drugs deemed to have a higher-than-average risk of abuse or addiction.

Salvia is already banned or regulated in about a dozen countries including Australia, Japan, Germany and Belgium, and some dozen states in the U.S.

---

I think the real issue here is a distinction in what the two legislative frameworks govern.....at the end of the day, the FDR don't make anything or drug or product illegal, they make the sale of something illegal if you don't meet the requirements. By contrast, the CDSA prohibits all activities with substances listed in Schedules (which salvia is not), ie. makes a substance virtually "illegal" (although we don't use that terminology) unless they are authorized by regulation.....

As requested.

Would you be able to provide me with a little bit more detail that we can share with MO?

-what are we doing to assess

OCS is currently finalizing an Issue Analysis Summary which analyzes the potential benefits and risks of scheduling Salvia under the CDSA, as well as other mechanisms for the control of this substance. The final Summary will be used to determine what action to control Salvia is most appropriate.

-what factors do we consider

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

**s.21(1)(a)**

-do we have a sense of what decision will be

OCS brought a draft Issue Analysis Summary regarding the potential scheduling of Salvia to the Controlled Substances Scheduling Working Group (CSS-WG) for their recommendation. This group includes HECSB, HPFB and HPFBI members and is responsible for assessing substances to determine whether they should be placed in a Schedule to the CDSA and its Regulations. [REDACTED]

**s.21(1)(b)**

[REDACTED] OCS is currently working to finalize the Issue Analysis Summary in light of this recommendation. This recommendation will be approved by the Director of OCS and then sent to the Director General of CSTD for concurrence.

-timing for decision:

At this time, OCS is unable to provide a timeline as to when the above described approval process will be completed.

s.21(1)(a)

s.21(1)(b)

Hello -

I understand someone from HPFB was trying to reach someone from OCS but was unable this morning.

I understand from media inquiries earlier this week that we are currently assessing whether its regulation under the CDSA is warranted.

Would you be able to provide me with a little bit more detail that we can share with MO?

- what are we doing to assess
- what factors do we consider
- do we have a sense of what decision will be
- timing for decision.

A phone conversation or a few lines in an email would be perfect - nothing too detailed needed.

Thank you!

Would you be able to provide me with a little bit more detail that we can share with MO?

-what are we doing to assess

OCS is currently finalizing an Issue Analysis Summary which analyzes the potential benefits and risks of scheduling Salvia under the CDSA, as well as other mechanisms for the control of this substance. The final Summary will be used to determine what action to control Salvia is most appropriate ~~at this time~~.

-what factors do we consider

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

} check with Triana

-do we have a sense of what decision will be

OCS brought a draft Issue Analysis Summary regarding the potential scheduling of Salvia to the Controlled Substances Scheduling Working Group (CSS-WG) for their recommendation. This group includes HECSB, HPFB and HPFBI members and is responsible for assessing substances to determine whether they should be placed in a Schedule to the CDSA and its Regulations. [redacted]

[redacted] OCS is currently working to finalize the Issue Analysis Summary in light of this recommendation.

-timing for decision. → *concerned by DCS*

At this time, OCS is unable to provide a timeline as to when this decision will be finalized.

- to be approved by director OCS

Hi Jocelyn,

Below are our proposed responses.

*All scheduling assessments involve the development of a that summarizes info available regarding the scheduling factors*

**What are we doing to assess?**

OCS is currently finalizing an Issue Analysis Summary which analyzes the potential benefits and risks of scheduling Salvia under the CDSA, as well as other mechanisms for the control of this substance. The final Summary will be used to determine what action to control Salvia is most appropriate.

**What factors do we consider?**

Health Canada considers several factors in determining whether regulation of a substance under the Controlled Drugs and Substances Act (CDSA) is warranted. These include:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

*of an and identifies possible options for regulatory and non-rg. action.*

**Do we have a sense of what decision will be?**

OCS brought a draft Issue Analysis Summary regarding the potential scheduling of Salvia to the Controlled Substances Scheduling Working Group (CSS-WG) for their recommendation. This group includes HECSB, HPFB and HPFBI members and is responsible for assessing substances to determine whether they should be placed in a Schedule to the CDSA and its Regulations.

*A recent*

s.21(1)(a)  
s.21(1)(b)

**What is the timing for the decision?**

OCS is currently working to finalize the Issue Analysis Summary in light of the above noted CSS-WG recommendation. The IAS and the recommendation contained therein will be forwarded to the Director of OCS for review and approval by the end of October. Once approved, the recommended course of action will be presented to the Director General of CSTD for concurrence.

*A draft*

*used the*

*It has not yet been decided what schedule the substance will be added to.*

## Hallucinogenic salvia illegal in Canada, but still sold

*The Canadian Press*

Updated: Tue. Oct. 19 2010 9:04 AM ET

OTTAWA — Canada is no longer a safe legal haven for salvia divinorum, the potent hallucinogenic plant that is sold openly online and in head shops across the country.

Yet no one seems aware of the law and Health Canada is not enforcing it.

Websites and shopkeepers are still advertising the plant as a perfectly legal head trip for Canadians eager to join the thousands of "pschonauts" who've posted videos of their psychedelic salvia voyages on YouTube.

An estimated 1.6 per cent of Canadians aged 15 or older have already taken at least one ride on salvia, according to the 2009 Canadian Alcohol and Drug Use Monitoring Survey, the first to measure use of the plant.

For those aged 15-24, the number rises to 7.3 per cent.

Yet the federal government says products containing salvia divinorum and its active ingredient, salvinorin A, are considered natural health products and, as such, must be authorized by Health Canada before they can be sold.

"It is illegal to sell NHPs (natural health products) in Canada unless they have been reviewed by Health Canada and authorized for sale," Christelle Legault, a spokesperson for Health Canada, told The Canadian Press in an email.

"To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient."

Legault added: "The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the Food and Drugs Act."

This comes as news to head shops that are openly selling vials of salvia extract -- for \$20 to \$80 per gram, depending on the potency -- within spitting distance of Parliament Hill.

One shopkeeper, who asked not to be identified, said he's had no notification that the plant, also known as diviner's sage and magic mint, can no longer be legally sold in Canada. He said he purchases the extract from a Canadian supplier.

It's news to the police as well, who've complained in the past that their hands are tied when it comes to salvia, which has been known to produce some adverse reactions, including one case reported by Health Canada in 2006 in which a teenage boy became incoherent and suicidal and threatened to kill police officers.

"Until the government makes it illegal, there's nothing we can do about it," said Robin Percival, communications strategist for drugs and organized crime at RCMP national headquarters.

Informed that Health Canada says it is, in fact, illegal to sell salvia without authorization under the Natural Health Products Regulations, Percival said: "I don't think we have any jurisdiction there."

Indeed, it would appear that enforcement of the regulations is entirely up to Health Canada's Health Products and Food Branch Inspectorate.

Asked why Health Canada has not stopped the illegal sale of salvia, department spokesman Gary Holub said complaints can be referred to the inspectorate by calling 1-800-267-9675.

However, an open letter from the inspectorate to "all interested parties" on Aug. 27 suggests the inspectorate has not yet really begun in earnest to enforce the Natural Health Products Regulations.

The letter recounts that the regulations came into force in 2004. Due to the large backlog of

products that needed to be assessed for safety and quality before they could be licensed by Health Canada, suppliers were given until June 2008 to submit applications for licensing.

It appears the process took longer than expected and only now is the inspectorate preparing to actually enforce the regulations.

The letter advises that a new compliance and enforcement policy has now been adopted, which is to be fully implemented in February. In the meantime, suppliers are being given a six-month transition period during which those who've taken steps to become compliant and have made a submission for licensing will be "considered a lower priority for enforcement, unless a risk to health or additional non-compliances are identified."

The chances of salvia ever receiving Health Canada's seal of approval seem slim, given the department's dim view of the product.

"Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body and its impact on physical and mental functions," said department spokesperson Legault.

Indeed, she said Health Canada is currently reviewing available information about the plant to determine whether it should be included in the Controlled Drugs and Substances Act, which regulates or bans drugs deemed to have a higher-than-average risk of abuse or addiction.

Salvia is already banned or regulated in about a dozen countries including Australia, Japan, Germany and Belgium, and some dozen states in the U.S.

## Cover Letter - The Inspectorate's Natural Health Products Compliance and Enforcement Policy (POL-0044)

Health Products and Food Branch Inspectorate  
Graham Spry Building, 3rd Floor  
250 Lanark Avenue  
Address Locator 2003B  
OTTAWA, Ontario  
K1A 0K9

Date August 27, 2010

To: All Interested Parties

I am pleased to inform you that the document entitled "Natural Health Products Compliance and Enforcement Policy" (POL-0044) (NHP C&E Policy) is now available on the Compliance and Enforcement section of Health Canada's website.

This policy describes the compliance and enforcement approach respecting natural health products (NHPs) under the *Food and Drugs Act (FDA)* and the *Natural Health Products Regulations (NHPR)* and is to be used in conjunction with the Compliance and Enforcement Policy (POL-0001). This policy replaces the previous policy "Compliance Policy for Natural Health Products" last revised in 2008 as well as the "Compliance Guide for NHPs" (Version 2.1, 2007).

The implementation of this new NHP C&E Policy is being followed by a six month compliance promotion transition period described in this cover letter. This period of compliance promotion will allow for the transition from the old policy to the new policy regarding the product licensing requirements for NHPs.

This policy is also being implemented with the "Annex to the NHP Compliance and Enforcement Policy for exempt NHPs under the Natural Health Products (Unprocessed Product Licence Applications) Regulations (NHP-UPLAR)". The annex has been developed in order to provide clarification on the compliance and enforcement approach for products that are exempt under the NHP-UPLAR. This Annex is meant to be used in conjunction with the new NHP C&E Policy, and will remain in effect for 30 months until the NHP-UPLAR are repealed.

### Background

On January 1<sup>st</sup>, 2004 the NHPR came into force. At that time, it was acknowledged that there would be a large number of NHPs already available on the market that may not be in full compliance with the NHPR. In particular, products already on the market would not have product licences as required by the NHPR as they would first need to be assessed for safety and quality by the Natural Health Products Directorate (NHPD).

To aid in this "transitional period" during the existence of the product licensing backlog, the Compliance Policy for NHPs was developed. This policy provided guidance for the prioritization of compliance and enforcement actions. It outlined a risk based approach, f001350

category approach which outlined that: if an active submission number was granted by the NHPD for a product by a specific deadline, the product would be considered a lower priority for compliance and enforcement activities, unless a risk to health was identified.

June 1<sup>st</sup> 2008 was the last deadline for submissions outlined in the previous Compliance Policy for NHPs. As such, all regulated parties associated with products currently available on the market should have already taken steps to come into compliance with the product licensing requirements, in obtaining a submission number from the NHPD in order to be considered a lower priority for enforcement under the previous Compliance Policy for NHPs.

### **Public Consultation**

In November of 2009, Health Canada's NHP Program (the NHPD, the Marketed Health Products Directorate and the Inspectorate) conducted workshop sessions across Canada and received stakeholder feedback that was taken into consideration in the development of the new NHP C&E Policy. Feedback from these sessions suggested that the implementation of a new compliance and enforcement approach for unlicensed NHPs should be dependant on the pending resolution of the product licensing backlog and the establishment of performance targets for product licence application review. In addition, a period of compliance education and awareness to transition into a new policy was desired as well as enhanced outreach to consumer, retailer and practitioner groups.

As such, Health Canada is implementing the new C&E Policy along with the coming into force of the new NHP-UPLAR, as well as the implementation of the new NHPD Application Management Policy (August 2010), which will both provide predictability in the product licensing process as well as allowing for the legal sale of certain NHPs. As well, the compliance promotion transition period described below will allow for the transition from the previous Compliance Policy for NHPs to this new policy. In May and June of 2010, Health Canada held information sessions across Canada informing stakeholders of the new NHP Approach including the NHP-UPLAR, the new NHP C&E Policy and the NHPD Application Management Policy.

### **Compliance Promotion Transition Period**

The posting of this new NHP C&E Policy is being followed by a six month compliance promotion transition period respecting the product licensing requirements which will precede the full implementation of the policy.

During the compliance promotion transition period, regulated parties that have already taken steps to come into compliance with the product licensing requirements and have an active submission number with the NHPD will be considered a lower priority for enforcement, unless a risk to health or additional non-compliances are identified. This position is consistent with the position which was outlined in the previous Compliance Policy for NHPs (2008). During this period, compliance and enforcement efforts will focus on regulated parties that have not taken steps to come into compliance and/or products that pose a risk to health.

### **Full Implementation of the new NHP C&E Policy**

Full implementation of the new policy is anticipated to begin in February of 2011 at which time NHPs without a product licence or exemption number may be subject to compliance and enforcement activities and should not be available for sale or imported for sale into Canada.

Inquiries about this document can be addressed to the Drug Compliance Verification and Investigation Unit, Fax: (613) 946-5636 or by E-Mail: [DCVIU\\_UVCEM@hc-sc.gc.ca](mailto:DCVIU_UVCEM@hc-sc.gc.ca).

## **1.0 Purpose**

The purpose of this policy is to describe Health Canada's approach to compliance and enforcement of Natural Health Products (NHPs) under the *Natural Health Products Regulations* (NHPR) and the *Food and Drugs Act* (FDA).

The main objective of this policy is to foster fairness, transparency and uniformity in the compliance and enforcement approach taken by Health Canada in instances of non-compliance.

This policy replaces and supersedes the Compliance Policy for Natural Health Products (implemented in 2004, and revised in September 2008). It also replaces the Natural Health Products Compliance Guide (Version 2.1 Jan. 2008). This policy is to be used in conjunction with Health Canada's Compliance and Enforcement Policy (POL-0001) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/gmp-bpf/pol/pol\\_1\\_tc-tm-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/gmp-bpf/pol/pol_1_tc-tm-eng.php)).

## **2.0 Background**

The NHPR came into force on January 1, 2004. These regulations fall under the FDA, and as such, NHPs are legally considered to be drugs in regards to the FDA. The FDA and the NHPR apply to all NHPs as defined in the NHPR and they set out requirements for the manufacturing, packaging, labelling, importing, storing, distributing, selling and advertising of NHPs.

The NHPR are intended to ensure that all Canadians have ready access to NHPs that are safe, effective and of high quality, while respecting freedom of choice and philosophical and cultural diversity. Compliance with the FDA and NHPR helps ensure this mandate is being met and allows consumers to have greater confidence in the products they choose. It is essential that the NHP industry, Health Canada, health care practitioners and the public all work together to help maintain confidence that NHPs being made available for sale in Canada are safe, effective and of high quality.

Within Health Canada, the NHPR are administered by the Natural Health Products Program which is comprised of the Natural Health Products Directorate (NHPD), the Marketed Health Products Directorate (MHPD) and the Inspectorate (which has staff within the Health Products and Food Branch (HPFB) as well as the Regions and Programs Branch (RAPB)). Compliance and enforcement activities are primarily led by Health Canada inspectors situated within the Inspectorate.

## **3.0 Scope**

This policy applies to instances of non-compliance with the FDA and/or the NHPR as they relate to NHPs, with the exception of NHPs used in clinical trials involving human subjects (Part 4 of the NHPR).

This policy describes Health Canada's compliance and enforcement approach when instances of non-compliance with the FDA and/or NHPR are identified.

## **4.0 Definitions**

The source of the definitions has been indicated in parenthesis as follows:

- *Food and Drugs Act* (FDA)
- *Natural Health Products Regulations* (NHPR)
- Compliance and Enforcement Policy (POL-0001)

*Definitions may have been adjusted from their original source to fit the context of this policy.*

**Adverse Reaction:** (NHPR) means a noxious and unintended response to an NHP that occurs at any dose used or tested for the diagnosis, treatment or prevention of a disease or for modifying an organic function.

**Advertisement:** (FDA) includes any representation by any means whatever for the purpose of promoting directly or indirectly the sale or disposal of a drug (including an NHP) under the FDA or the NHPR.

**Compliance:** (POL-0001) the state of conformity of a regulated party (including a corporation, institution, individual or other legal entity) or an NHP with the FDA or the NHPR.

**Compliance Verification:** (POL-0001) actions taken by the Inspectorate to verify compliance in response to information regarding a known or suspected non-compliance with the FDA and/or NHPR.

**Distributor:** (NHPR) a person who sells an NHP to another person for the purpose of further sale by that other person.

**Enforcement:** (POL-0001) actions that may be taken to induce, encourage or compel compliance with the FDA and the NHPR.

**Importer:** (NHPR) a person who imports an NHP into Canada for the purpose of sale.

**Inspector:** (FDA) any person designated as an inspector for the purpose of the enforcement of the FDA and the NHPR under subsection 22(1) of the FDA.

**Label:** (FDA) includes any legend, word or mark attached to, included in, belonging to or accompanying any drug (including an NHP) or package.

**Manufacturer:** (NHPR) means a person who fabricates or processes an NHP for the purpose of sale, but does not include a pharmacist or other health care practitioner who, at the request of a patient, compounds an NHP for the purpose of sale to that patient.

**Market Authorization:** a product licence issued by Health Canada, authorizing the sale of an NHP, issued pursuant to section 7 of the NHPR on the basis of information submitted in a licence application to the NHPD. The market authorization is in the form of an eight (8) digit numerical code following the acronym NPN (Natural Product Number) or DIN-HM (Homeopathic Medicine Number).

**Natural Health Product:** (NHPR) a substance set out in Schedule 1 to the NHPR or a combination of substances in which all the medicinal ingredients are substances set out in Schedule 1, a homeopathic medicine or a traditional medicine that is manufactured, sold or represented for use in:

- a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- b) restoring or correcting organic functions in humans; or
- c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

However, a natural health product does not include a substance set out in Schedule 2 to the NHPR, any combination of substances that includes a substance set out in Schedule 2 or a homeopathic medicine or a traditional medicine that is or includes a substance set out in Schedule 2. Also, in accordance with subsection 2(2) of the NHPR, a substance or combination of substances or a traditional medicine is not considered to be a natural health product if its sale, under the *Food and Drug Regulations (FDR)*, is required to be pursuant to a prescription when it is sold other than in accordance with section C.01.043 of the FDR.

**Non-Compliance:** a state of nonconformity with a specific regulatory requirement of the FDA and/or the NHPR.

**Package:** (FDA) includes any thing in which any drug (including an NHP) is wholly or partly contained, placed or packed.

**Recommended conditions of use:** (NHPR) the recommended use or purpose; dosage form; recommended route of administration; recommended dose; recommended duration of use, if any; and its risk information, including any cautions, warnings, contra-indications or known adverse reactions of an NHP.

**Sell:** (FDA) offer for sale, expose for sale, have in possession for sale and distribute, whether or not the distribution is made for consideration.

**Specifications:** (NHPR) means a description of an NHP that contains the information described in subsection 44(2) of the NHPR.

## 5.0 Policy

### 5.1 Policy Statement

It is the responsibility of the regulated party to ensure that NHPs being sold, advertised, manufactured, packaged, labelled, imported, distributed or stored comply with the FDA and the NHPR. In accordance with Compliance and Enforcement Policy (POL-0001) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/gmp-bpf/pol/pol\\_1\\_tc-tm-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/gmp-bpf/pol/pol_1_tc-tm-eng.php)), where non-compliance with the FDA and/or the NHPR is identified by the Inspectorate, it is brought to the attention of the regulated party (ie. the company or individual involved). It is then the regulated party's responsibility to take timely and appropriate action to comply with legislative and regulatory requirements. Compliance is normally achieved through a cooperative approach among the regulated party, the Inspectorate and other relevant organizations within Health Canada. However, a number of enforcement options are available if necessary, particularly when the regulated party is unable or unwilling to correct non-compliance. The Inspectorate's role is to ensure that the regulated party complies with the regulatory decisions. The primary objective of the response strategy is to manage the risk to Canadians and use the most appropriate level of intervention to ensure that the responsible regulated party brings the product or activity into compliance. In identifying the appropriate enforcement action, many factors are considered including the risk to health, the likelihood of compliance by the regulated party (considering their history of compliance, intent and degree of cooperation being offered) and available resources.

## **5.2 Guiding Principles**

This policy is founded on the principles contained in the Inspectorate's Compliance and Enforcement Policy POL-0001. Risk management principles are guided by Health Canada's Decision Making Framework (<http://www.hc-sc.gc.ca/sr-sr/advice-avis/decision/index-eng.php>).

## **5.3 Responsibilities**

As indicated in POL-0001, where non-compliance is brought to the attention of a regulated party it is the regulated party's responsibility to take timely and appropriate action to comply with regulatory requirements and to ensure that appropriate risk management actions are taken.

It is the responsibility of the Inspectorate to conduct compliance and enforcement activities related to NHPs. Where the Inspectorate identifies or is notified of a potential non-compliance, the primary objective of the response strategy is to manage the risk to Canadians and use the most appropriate level of intervention to help ensure that the regulated party brings the product or activity into compliance.

## **6.0 Identified Non-Compliance**

The safety of Canadians is the highest priority for Health Canada. Generally, Health Canada becomes aware of instances of non-compliance of NHPs primarily through consumer or trade complaints, and/or referrals from internal and external partners. When a complaint is received, the Inspectorate aims to prioritize the potential non-compliance according to the possible level of risk it may pose in order to most effectively apply departmental resources on a risk based approach. Generally, non-compliances that Health Canada considers to be a higher risk are assigned the highest priority for Inspectorate compliance verification, and are expected to result in immediate risk management actions by the regulated party as needed.

This section is intended to provide guidance regarding the initial risk classification of various non-compliances with the NHPR or FDA. Several non-compliances with the FDA or NHPR have been classified according to their initial level of risk classification. For the purpose of this policy, these have been defined as:

- Higher risk non-compliances
- Non-compliances that may pose a risk to health and;
- Lower risk non-compliances

These initial classifications are intended to provide guidance only. The circumstances surrounding a situation could modify the risk and/or resulting compliance and enforcement actions from that outlined below. In some instances, the Inspectorate may request that a formal risk assessment be conducted by the NHPD or other partners, in order to make a determination on the risk to health of a particular non-compliance. The level of risk could increase or decrease at any time if new information emerges.

## **6.1 Higher Risk Non-Compliances**

There are a number of instances of non-compliance which are initially considered by Health Canada to pose a higher risk to health. Immediate risk management actions are expected in these circumstances. This section outlines some of the situations in which Health Canada may consider as instance(s) of non compliance posing a higher risk to health. This list is not exhaustive and is in no particular order. Details regarding the enforcement approach for instances of higher risk non-compliances can be found in section 7 of this policy.

### ***Non-Compliance with Licensing Requirements***

#### ***6.1.1 Unlicensed products sold and/or imported for sale***

As per section 4 of the NHPR, all NHPs require a product licence to be sold. A product licence demonstrates that a product has been assessed by Health Canada for its safety, efficacy and quality. NHPs that have not undergone this assessment are considered to pose a risk to health. For example, the product may not be labelled with adequate risk information, it may contain an ingredient unsuitable for vulnerable sub-populations such as children or pregnant women, it may contain levels of bacterial or chemical contaminants that do not conform to NHPD requirements and therefore the specifications for product testing may not be appropriate. The safety, efficacy and quality of an NHP are assessed through the product licensing process. Counterfeit products are considered to be unlicensed products and do not adhere to numerous requirements in the FDA and the NHPR. For more information refer to the Policy on Counterfeit Health Products (POL-0048) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/activit/pol\\_0048\\_counterfeit-contrefacon-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/activit/pol_0048_counterfeit-contrefacon-eng.php)). For more information regarding product licensing, refer to the Product Licensing Guidance Document ([http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/license-licence\\_guide\\_tc-tm-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/license-licence_guide_tc-tm-eng.php)).

#### ***6.1.2 Unlicensed sites conducting licensable activities***

As per section 27 of the NHPR, manufacturers, packagers, labellers and importers are required to hold a valid site licence. A site licence demonstrates that Health Canada has assessed the application and determined that the applicant has provided the required documentation to be issued a site licence. Applicants must demonstrate that the activities being conducted at the site are being conducted in accordance with Good Manufacturing Practices (GMPs), as outlined in Part 3 of the NHPR. GMPs help ensure the consistent quality of an NHP. All NHPs must be manufactured, packaged, labelled, imported, distributed and stored in accordance with these GMPs as per section 43 of the NHPR. Products from unlicensed sites have not provided the evidence required through the site licensing process to demonstrate that they have been manufactured, packaged, labelled, or imported in accordance with GMPs and may thus pose a higher risk to health. GMP non-compliances for licensed sites are further outlined in section 6.2.3 of this policy. For more information on site licensing, refer to the Site Licensing Guidance Document (<http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/slgsd-drle-eng.php>).

#### ***Importation of NHPs from Foreign Sites***

Canadian importers of NHPs must be licensed and the onus is on them to provide evidence that imported products come from sites that meet Canadian GMPs under Part 3 of the NHPR

or equivalent standards. All foreign sites are listed on an importer's site licence to demonstrate they are in compliance with the GMP requirements.

***Non-Compliances that may be identified with licensed products:***

***6.1.3 Licensed products subsequently labelled and/or advertised with an unauthorized Schedule A claim***

As per section 3 of the FDA, an NHP cannot be labelled or advertised to the general public for the prevention, treatment or cure of diseases listed in Schedule A of the FDA. On June 1, 2008 regulatory amendments were made to the *Food and Drug Regulations (FDR)* and the NHPR to allow the sale and advertising of NHPs that only make preventative claims for diseases listed in Schedule A, provided that the product has been reviewed and authorized by Health Canada. Claims of treatment or cure of a disease listed in Schedule A are still prohibited. For further information refer to the Canada Gazette (<http://gazette.gc.ca/archives/p2/2007/2007-12-26/html/sor-dors288-eng.html>). Diseases listed in Schedule A of the FDA, such as cancer and diabetes, all require medical intervention. The use of products through self-medication for serious diseases may result in harm to the consumer. The complete list of schedule A diseases can be found in the FDA (<http://laws.justice.gc.ca/eng/F-27/page-3.html#anchors:1>). A product labelled and/or advertised with an unauthorized Schedule A claim is also considered to be non-compliant with additional parts of the FDA or NHPR as referenced in sections 6.2.1 and 6.2.2 of this policy.

***6.1.4 Licensed product does not meet its specifications or is adulterated***

Under section 44 of the NHPR, every NHP available for sale must comply with the specifications approved by the NHPD for the licensed product. Specification requirements include: product purity, quantity and identity of the medicinal ingredients, potency if applicable, and testing methods. Non-compliance with this section of the NHPR may result in a product posing a higher risk to health. For example, an NHP may be contaminated with bacteria and mold, toxic metals such as mercury, lead, cadmium and arsenic, and residues of pesticides, PCBs, dioxins, or solvents; it may be super-potent or sub-potent or contain misidentified ingredients.

While product specifications cannot speak to every possible substance that could be present in an NHP, paragraph 8(b) of the FDA generally prohibits the sale of an NHP that is adulterated. An NHP may be considered adulterated if it contains an extraneous, improper or inferior (sub-standard to the product specifications) ingredient or a substance not reasonably expected to be found in the NHP. An NHP may also be considered adulterated when its specifications speak to a substance being present up to a certain level and the substance is present at a level above that limit. Adulterated NHPs may pose a higher risk to health, depending on the nature of the adulterant

The sale of an NHP which contains an undeclared prescription drug will be considered an enforcement priority due to the nature of the risks involved with drugs containing Schedule F ingredients. Health Canada will consider the sale of these products to be in violation of section 8(b) of the FDA. It is the responsibility of the regulated party to ensure that every

NHP meets its specifications and is not adulterated. Tolerance limits for some microbial and chemical contaminants are set out in the NHPD guidance document, Evidence for the Quality of Finished Natural Health Products (<http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/eq-paq-eng.php>).

## **6.2. Non-Compliances that may pose a risk to health**

There may be other instances of non-compliance that could pose a risk to health. Upon assessment of the specific circumstances surrounding a non-compliance, the risk could increase or decrease at any time. This section outlines some of these instances of non-compliance, in no particular order.

### ***6.2.1 Product is not labelled or packaged in accordance with Part 5 of the NHPR***

Part 5 of the NHPR sets out the labelling and packaging requirements for NHPs available for sale to the public. This part does not apply to sale that is restricted to a manufacturer or distributor (Section 86 of the NHPR). Part 5 outlines requirements for information to be in accordance with the terms of the product licence (e.g., the recommended use, dose, risk information etc.), additional labelling requirements (e.g., expiry date, importer information etc.) as well as presentation of labelling information on NHPs (e.g., NPN on the principle display panel, bilingual labelling, security packaging etc.). A product that is not labelled in accordance with its product licence and Part 5 of the NHPR may not contain enough information to be used safely. For example, a product may contain incorrect or incomplete risk information. In accordance with section 9(2) of the FDA, an NHP that is not labelled or packaged in accordance with the NHPR is considered to be labelled or packaged contrary to subsection 9(1). Thus its sale may contravene s. 9(1) as being sold in a false, misleading or deceptive manner. See section 6.2.2 of this policy. Non-compliance with Part 5 of the NHPR may result in a product that is determined to pose a higher risk to health once assessed. For more information, refer to the Labelling Guidance Document (<http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/labelling-etiquetage-eng.php>).

### ***6.2.2 Product is sold and/or advertised in a false, misleading or deceptive manner***

Section 9(1) of the FDA sets out that no person shall label, package, treat, process, sell or advertise any health product in a manner that is false, misleading or deceptive or is likely to create an erroneous impression regarding its character, value, quantity, composition, merit or safety. In order to allow consumers to make an appropriate and informed choice, advertising of NHPs should clearly communicate the intended use of the product in a manner that is consistent with the product licence. A product that is being labelled, sold or advertised in a manner consistent with that product's terms of market authorization, absent other factors, would not generally be false or misleading, or likely to create an erroneous impression with respect to its character, value, quantity, composition, merit or safety. Unauthorized claims made in conjunction with authorized products may be misinterpreted by the consumer as being authorized claims, as such these claims may contravene section 9(1) of the FDA by misleading consumers to believe the products are authorized to be sold with those claims. Any products or advertising materials brought to the attention of Health Canada will be evaluated and may be subject to compliance and enforcement actions on the basis of section 9 of the FDA. The Inspectorate and the MHPD work closely on advertising complaints with the Advertising Preclearance Agencies. Further information can be found in the document

Regulatory Requirements for Advertising (<http://www.hc-sc.gc.ca/dhp-mps/advert-publicit/index-eng.php>). Of particular interest is the Consumer Advertising Guidelines for Marketed Health Products (for Nonprescription Drugs including Natural Health Products) ([http://www.hc-sc.gc.ca/dhp-mps/advert-publicit/pol/guide-ldir\\_consom\\_consum-eng.php](http://www.hc-sc.gc.ca/dhp-mps/advert-publicit/pol/guide-ldir_consom_consum-eng.php)).

### **6.2.3 Good Manufacturing Practices (GMP) non-compliances**

Part 3 of the NHPR sets out the requirements for GMPs. Compliance with this part is required for all those who manufacture, package, label, import, distribute or store NHPs. GMPs are ongoing practices designed to ensure an effective overall approach to product quality control and risk management. They do so by setting appropriate standards and practices for places, people, processes and products. For example, setting out that premises and equipment must be clean to prevent contamination; that quality assurance people are present and have appropriate expertise to control the activities and approve release of products; that processes are in place for proper sanitation and operations such as the ability to conduct a product recall; and that products meet their specifications and appropriate records are maintained. GMP violations may adversely affect the quality of the products and may result in different levels of risk based on the specific violation. Violations of GMP provisions are to be assessed by the regulated party to determine if risk management actions are required with respect to the products or any processes related to the activities. Further information can be found in the Good Manufacturing Practices Guidance Document (<http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/gmp-bpf-eng.php>).

### **6.3 Lower Risk Non-Compliances**

Instances of non-compliance that do not result in a product or activity posing a risk to health and in which corrective actions can be taken in a timely manner by the regulated party may be considered a lower priority for Health Canada enforcement measures.

## **7.0 Compliance and Enforcement Approach**

POL-0001 and the policy position stated in section 5.1 of this policy summarize the overall compliance and enforcement approach in relation to NHPs. As indicated, the risk to health, as well as a number of additional factors, such as the likelihood of compliance by the regulated party, are taken into consideration in determining the compliance and enforcement approach and risk management tools employed. Generally, as the risk to health increases, coupled with additional factors, such as a low likelihood of compliance by the regulated party, the likelihood that risk management tools will be used also increases.

In response to instances of non compliance, the Inspectorate has a number of compliance measures available to address the situation. The Inspectorate may request that the regulated party take certain voluntary measures in response to an identified non-compliance. There are also a number of powers that can be used by the Inspectorate, where intervention is warranted, which are further detailed in POL-0001. Voluntary measures by the regulated party may include but are not limited to: corrective actions to prevent recurrence, a product stop sale, recall or public communications pieces. Measures available to the Inspectorate may include but are not limited to: warning letters, public communications pieces, product seizures, and importation refusals or the issuance of import alerts. The NHPR contain additional post-licensing tools that may be used to address non-compliance. These tools include:

- a request for additional safety information under section 16 or 24 of the NHPR,
- a direction to stop sale under section 17 of the NHPR, and;
- a suspension or cancellation of a product or site licence under sections 18 or 19 and sections 39 or 40 respectively.

Further information can be found in the NHP Post Licensing Guidance Document ([http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd\\_psdldr-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd_psdldr-eng.php)).

The Inspectorate and regulated parties have a shared responsibility for monitoring compliance with the FDA and its Regulations. Where the non-compliance identified might impact the safety, efficacy or quality of the NHP, the Inspectorate expects that the regulated party will immediately stop the sale and/or importation of the product or the activity being conducted. The Inspectorate expects that the regulated party will take immediate action to assess the risk associated with the non-compliance to determine the risk management actions required as well as take preventative action to achieve and maintain compliance. The stop sale should not be lifted until such a time that compliance is achieved and appropriate risk management actions have been taken. The Inspectorate expects that the regulated party will take full responsibility for product recalls. Further compliance and enforcement actions in accordance with POL-0001 may be taken if a regulated party fails to voluntarily recall a product. Any recall initiated must be reported to the Inspectorate within 3 days after the day on which the recall is commenced along with the necessary recall information as per section 62 of the NHPR in accordance with the Inspectorate's Recall Policy (POL-0016) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/info-prod/drugs-drogués/pol\\_0016\\_recall\\_policy-politique\\_retrait\\_ltr-doc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/info-prod/drugs-drogués/pol_0016_recall_policy-politique_retrait_ltr-doc-eng.php)).

In general, the Inspectorate will work with the regulated party using the appropriate level of oversight based on the level of risk in accordance with POL-0001. Enforcement actions may be taken at any time where warranted by circumstances such as lack of cooperation or an inability to address the noncompliance. Failure of companies to respond to written notices or letters advising of recommended compliance actions are interpreted as an indication that the company does not intend to voluntarily comply and that enforcement action is required. Companies with a history of failure to provide adequate response to noncompliance(s) may be subject to immediate enforcement action.

When an issue of non-compliance is identified that does not impact the safety, efficacy or quality of an NHP, the company should ensure that appropriate corrective actions have been taken to resolve the non-compliance in a timely and effective manner and to prevent future recurrence. When identified to the Inspectorate, the Inspectorate may work with the regulated party using a lower level of enforcement oversight. If it is determined at any time that the non-compliance may pose a higher risk to health, further risk management actions may be required.

Continued non-compliance may result in the recommendation by the Inspectorate to the NHPD for actions such as requests for safety information under section 16 of the NHPR related to the product and/or the recommendation to issue an intent to suspend for a product or site licence under sections 18 or 39 of the NHPR respectively, or in cases where there is a risk to health, an immediate suspension of a product or site licence under section 19 or 40 of the NHPR.

Outlined below are some examples of how the compliance and enforcement approach may be applied in some instances of non-compliance, in accordance with POL-0001. The examples provided are intended to

serve as a general guide and do not include all instances of non-compliance. Circumstances surrounding the non-compliance may result in variance from the examples provided.

### **7.1 Unlicensed products being sold**

When the Inspectorate has reasonable grounds to believe that an NHP is being sold without a product licence in contravention of section 4 of the NHPR, the Inspectorate may issue a direction to stop sale to the manufacturer, distributor or importer of the unlicensed product. In addition, the Inspectorate may request that the manufacturer, distributor or importer initiate a product recall to the retail level in accordance with the Inspectorate Recall Policy. Recall information as required by section 62 of the NHPR must be provided to the Inspectorate within 3 calendar days of recall initiation. For licenses which have been suspended or cancelled under the NHPR, the stop sale and recall of any products available for sale should be initiated immediately upon the cancellation or suspension date. For more information refer to the Inspectorate's Recall Policy (POL-0016) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/info-prod/drugs-drogues/pol\\_0016\\_recall\\_policy-politique\\_retrait\\_ltr-doc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/info-prod/drugs-drogues/pol_0016_recall_policy-politique_retrait_ltr-doc-eng.php)).

If it comes to Health Canada's attention that an unlicensed NHP is being sold at retail, the retailer may be asked to remove the unlicensed product from sale. In addition, the retailer may be requested to provide the name and address of the supplier of the product. If successful in obtaining the information, the inspector may follow up with the manufacturer, distributor or importer of the product and proceed as indicated above. If the retailer directly imports the product for sale, or in the case where the retailer does not offer the necessary cooperation to remove the product or provide information on the supplier, the retailer may be treated as the distributor or importer of the unlicensed product.

#### ***Follow Up Expectations***

The manufacturer, importer or distributor should respond to the Inspectorate in writing within the requested timeframe indicating that they have complied. If a satisfactory response is not received within the requested timeframe, the Inspectorate may take further enforcement actions in accordance with POL-0001. These activities may include product seizures under the authority of section 23 of the FDA. Further risk management actions may be required, including public a communications piece initiated by the company or Health Canada.

### **7.2 Unlicensed products being imported**

Unlicensed NHPs being imported into Canada and brought to the attention of the Inspectorate may be recommended for refusal of entry into Canada. Health Canada may also issue an import alert for an identified importer, or a lookout for the product, in order to monitor future importations. Further information can be found in the Import and Export Policy for Health Products under the Food and Drugs Act and its Regulations (POL-0060) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/pol-0060\\_biu-uif-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/pol-0060_biu-uif-eng.php)) and the Guidance Document on the Import Requirements for Health Products under the Food and Drugs Act and its Regulations (GUI-0084) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/gui-0084\\_biu-uif-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/gui-0084_biu-uif-eng.php)).

### **7.3 Unlicensed Sites Conducting Licensable Activities**

When the Inspectorate has reasonable grounds to believe that a site is conducting licensable activities without a site licence in contravention of section 27 of the NHPR, the Inspectorate may issue a notice to the site to cease the licensable activity until such a time that a site licence is obtained. The site may be requested to stop the sale of all products associated with the unlicensed activity under section 17 of the NHPR, as they may not be in compliance with Part 3 of the NHPR. In addition, the site should conduct a thorough assessment of each product to determine if further risk management actions are required, such as product recalls. In the case of an importer, products being imported into Canada and brought to the attention of the Inspectorate may be recommended for refusal of entry into Canada. For more information, refer to the Import and Export Policy for Health Products under the Food and Drugs Act and its Regulations (POL-0060) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/pol-0060\\_biu-uif-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/pol-0060_biu-uif-eng.php)) and the Guidance Document on the Import Requirements for Health Products under the Food and Drugs Act and its Regulations (GUI-0084) ([http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/gui-0084\\_biu-uif-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/import-export/gui-0084_biu-uif-eng.php)).

#### ***Follow Up Expectations***

The site should respond to the Inspectorate within the requested timeframe indicating they have complied with the request to cease activities and stop sale of all products associated with the unlicensed activity. In addition, the site should provide an assessment of all products associated with the activity and any further risk management actions to be taken, such as product recalls. If a satisfactory response is not received within the timeframes, the Inspectorate may take further enforcement actions in accordance with POL-0001. These activities may include product and/or equipment seizures under the authority of section 23 of the FDA. Health Canada may also directly contact the product licence holders or distributors of the products associated with the unlicensed activity and take further compliance and enforcement actions. In the case of an importer, Health Canada may issue an import target to review future importations. If additional non-compliances with the FDA and NHPR are identified through the product assessment that could indicate a potential further risk to health, further risk management actions may be required including product recalls and a public communications piece initiated by the company or Health Canada.

### **7.4 Product labelling for the treatment or cure of any of the diseases, disorders or abnormal physical states referred to in Schedule A or in a manner that may pose a risk to health**

When the Inspectorate identifies an NHP that may be labelled for the treatment or cure of a Schedule A disease in contravention of section 3 of the FDA, the Inspectorate may issue a notice to the manufacturer, distributor or importer of the product to stop sale of the non-compliant NHP. In addition, the Inspectorate may request that the manufacturer, distributor or importer initiate a product recall to the retail level in accordance with the Inspectorate Recall Policy. Recall information as required by section 62 of the NHPR must be provided to the Inspectorate within 3 calendar days of recall initiation. The stop sale should not be lifted until such a time that compliance is achieved and appropriate risk management actions have been taken.

#### ***Follow Up Expectations***

The manufacturer, importer or distributor should respond to the Inspectorate in writing within the requested timeframe indicating they have complied. If a satisfactory response is not received within the requested timeframe, the Inspectorate may take further enforcement actions in accordance with POL-0001. These activities may include product seizures under the authority of section 23 of the

FDA or public communications pieces.

### **7.5 Product advertising for the treatment or cure of any of the diseases, disorders or abnormal physical states referred to in Schedule A**

When the Inspectorate identifies advertising materials for the treatment or cure of a Schedule A disease in contravention of section 3 of the FDA, the Inspectorate may issue a notice to the person responsible for the advertising to immediately cease the advertising activities. If the person responsible for the advertising is not the product licence holder, the Inspectorate may request that the person provide written notification to the product license holder of the advertising non-compliance.

#### ***Follow Up Expectations***

The person responsible for the advertising activities should respond to the Inspectorate in writing within the requested timeframe indicating that they have complied with the request. If a satisfactory response is not received within the requested timeframe, the Inspectorate may take further enforcement actions in accordance with POL-0001. These activities may include seizure of advertising materials, further contacting the product licence holder to inform them of the non-compliance and/or the issuance of a public communications piece.

## **8.0 Additional Considerations**

Additional compliance and enforcement considerations for regulated parties are outlined below:

### **8.1 Site information related to a product**

As per section 22 of the NHPR, every product licensee is required to provide the NHPD with all site information prior to commencing the sale of the NHP. This information is to be submitted to the NHPD through the notification process outlined in the Post Licensing Guidance Document ([http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd\\_psdldr-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd_psdldr-eng.php)). This information may be verified at any time by the Inspectorate or NHPD. The regulated party should keep this information readily available to provide to Health Canada upon request.

### **8.2 Post market surveillance, mandatory adverse reaction (AR) reporting and new scientific information**

Scientific information is continuously evolving. As such, there may be new scientific information that modifies the safety, efficacy or quality profile of a marketed NHP. It is the responsibility of the product licence holder to ensure the continued safety, efficacy and quality of the licensed NHP. Adverse Reaction (AR) reporting is an integral part of the post-market surveillance of NHPs and is a regulatory requirement for all product license holders, as set out in Section 24 of the NHPR. This includes the expedited reporting of all serious adverse reactions occurring within Canada and all serious unexpected adverse reactions occurring outside of Canada, and the preparation of a summary report of all adverse reactions to a licensed NHP on an annual basis. Regulated parties should have systems in place to monitor and assess adverse reactions received and take appropriate risk management actions. Failure to comply with post market requirements may present a potential risk to health and as such, may be subject to compliance and enforcement activities. It is important to

highlight that adverse reactions may also signify other non-compliances, including possible counterfeit products, labelling non-compliances, as well as GMP or product specification non-compliances (e.g. adulteration, contamination). Further information on mandatory expedited reporting of serious adverse reaction(s) and preparation of annual summary reports can be found in Health Canada's Guidance Document for Industry – Reporting Adverse Reactions to Marketed Health Products ([http://www.hc-sc.gc.ca/dhp-mps/pubs/medeff/\\_guide/2009-guidance-directrice\\_reporting-notification/index-eng.php/2009-guidance-directrice\\_reporting-notification/index-eng.php](http://www.hc-sc.gc.ca/dhp-mps/pubs/medeff/_guide/2009-guidance-directrice_reporting-notification/index-eng.php/2009-guidance-directrice_reporting-notification/index-eng.php)).

Should Health Canada become aware of new scientific evidence that could modify the safety, efficacy or quality profile of the product, Health Canada may contact the affected licensee(s) and request additional safety information under section 16 of the NHPR or section 24 of the NHPR (annual summary report and/or interim summary report). If there are reasonable grounds to believe that there may be an immediate risk to health, the product licence may be suspended under section 19 of the NHPR and compliance and enforcement actions may be taken.

### **8.3 Post market changes to licensed products**

NHPD must be informed of all post market changes made to licensed products. Under the NHPR, these are considered to be either amendments or notifications. Notifications are defined under section 12 of the NHPR and are considered to include changes which do not have a significant impact the safety, efficacy and/or quality of the product such as a change to the company information, site information, the addition or substitution of a non-medicinal ingredient that does not affect the safety or efficacy of the product, the brand name of the product, the common or proper name of any of the medicinal ingredients or the addition of risk information. Notifications should be submitted to the NHPD as soon as possible, but are required within 60 days of making the change to a marketed NHP.

Changes considered to be amendments as per section 11 of the NHPR require approval by the NHPD prior to making the change to the marketed product. These include but are not limited to: changes to the recommended dose, duration or recommended use or purpose, deletion or modification of risk information, a change to the source material or potency of any medicinal ingredient, certain changes to product specifications, among others. These changes may have an impact on the safety, efficacy or quality profile of the NHP and may significantly impact the assessment of information for which the product licence has been granted. Further information can be found in the Post Licensing Guidance Document ([http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd\\_psdldr-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/plgd_psdldr-eng.php)).

## **9.0 Complaint Reporting**

The Inspectorate is committed to verifying complaints regarding the quality or safety of health products.

Complaints regarding potential non-compliance with the FDA and/or NHPR can be reported to the nearest regional Operational Center using the following guidelines:

- How to submit a consumer complaint (GUI-044) ([http://www.hc-sc.gc.ca/dhp-mps/compl-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compl-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)) or
- How to submit a trade complaint (GUI-038) ([http://www.hc-sc.gc.ca/dhp-mps/compl-conform/prob-report-rapport/gui\\_38\\_trade-industrie\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compl-conform/prob-report-rapport/gui_38_trade-industrie_cp-pc-eng.php))

**Advertising:** If a complaint is regarding the advertising of an authorized NHP, the first route of adjudication of complaints should be through the advertising preclearance agencies. For further information, refer to the List of Canadian Advertising Preclearance Agencies ([http://www.hc-sc.gc.ca/dhp-mps/advert-publicit/preclear-preapprob/pca-apa\\_list-eng.php](http://www.hc-sc.gc.ca/dhp-mps/advert-publicit/preclear-preapprob/pca-apa_list-eng.php))

**Adverse Reactions:** In certain instances, a complaint may be related to an adverse reaction associated with the use of a particular NHP. Any suspected adverse reactions should be submitted to Canada Vigilance, and may be reported by phone to the Canada Vigilance regional offices at 1-866-678-6789, online, or by fax/mail. Electronic and hard copy forms are available through the MedEffect website (<http://www.hc-sc.gc.ca/dhp-mps/medeff/report-declaration/index-eng.php#a1>).

## 10.0 Reference Material

Below is a list of weblinks to related materials referenced in this policy. The list is not exhaustive. Most reference materials can be found from the NHPD website (<http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/index-eng.php>).

Jocelyn/Denis - see this version below. HPFB just deleted (from Friday's text) the term illegal - since it implies criminal conviction and can lead to confusion about jurisdiction - ie HC vs RCMP. The rest of the text is the same as what we used for the CP story.

Hi Nicole -

Please note edits in the text below. We would prefer not to use the term illegal - since it implies criminal conviction and can lead to confusion about jurisdiction - ie HC vs RCMP.

Otherwise - looks fine.

Thanks,  
B

Nicole Prentice

Hello, I have pulled these responses from last...

Subject: Fw: DEMANDE MÉDIA - Salvia (RNC Media - Abitibi-Témiscamingue)

Hello,

I have pulled these responses from last weeks approved response to the Canadian Press. As I am not fully bilingual, I am not sure if these responses completely answer the questions so your suggestions are very welcome.

If you are both OK with using these responses, I don't think any approvals will be necessary and we can just send to Christelle for translation. Let me know.

Thanks.

Q1 - Est-ce illégal ou simplement pas encore autorisé au Canada? (L'article cite la GRC qui dit qu'il ne peut rien faire auprès des acheteurs de salvia aussi longtemps que le gouvernement n'a pas légiféré pour rendre le produit illégal.)

A1) Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions. Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

← suggested by legal.

It is illegal a contravention of the Food and Drugs Act to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of unapproved products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.

Q2 - Est-ce que la vente du salvia est toujours autorisé ou non au Canada?

A2) Currently, there is no product containing *Salvia divinorum* authorized for sale in Canada. Unauthorized products may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of unapproved products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the CDSA is warranted.

Hello Mr. Bertrand and Mr. Saint-Pierre,

Would it be possible to convene a quick teleconference tomorrow morning to discuss the proposed responses to these questions? It is our view that the proposed responses may not fully answer the questions posed and may lead cause some confusion. As a result, there is a need to review the responses beyond the clarification of the legal/illegal distinction.

For example, it is our understanding that products containing salvia are would only be considered a NHP (and subject to the NHP regulations) *if they make a health claim*. This caveat is not specified in the response to Q1. While the response to Q2 may be technically correct, it does not address the status of

the salvia products actually sold (whether or not they make a health claim and can thus be considered a NHP).

Could you let us know your availability for a quick teleconference?

Thank You.

Denis

Jocelyn/Denis - see this version below. HPFB just deleted (from Friday's text) the term illegal - since it implies criminal conviction and can lead to confusion about jurisdiction - ie HC vs RCMP. The rest of the text is the same as what we used for the CP story.

Hi Nicole -

Please note edits in the text below. We would prefer not to use the term illegal - since it implies criminal conviction and can lead to confusion about jurisdiction - ie HC vs RCMP.

Otherwise - looks fine.

Thanks,  
B

Hi Stephanie

Pls see proposed response to Jesse's questions. Pls also note that we assume of course that the info is for internal use only.

**What are we doing to assess?**

All scheduling assessments involve the development of an Issue Analysis Summary that summarizes information about the substance being assessed in the context of each scheduling factor listed below, and identifies possible options for regulatory and non-regulatory action.

**What factors do we consider?**

Health Canada considers the following factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

**Do we have a sense of what decision will be?**

At a recent Controlled Substances Scheduling Working Group (intradepartmental group consisting of representatives from HECSB and HPFB),

**What is the timing for the decision?**

A final draft of the Issue Analysis Summary will be forwarded to the Director of OCS for review and approval by the end of October. Once approved, the recommended course of action will be presented to the Director General of CSTD for concurrence.

Let me know if you have questions.

Jocelyn

Abitibi-Témiscamingue)

Hi,

Here's what we are proposing as the revised response. Please confirm with your program folks that they are comfortable with this before sending along to MR.

As mentioned, we can also use parts of this to respond to the Cambrian College student's question that just came in.

Cheers,  
Beth

Q1 - Est-ce illégal ou simplement pas encore autorisé au Canada? (L'article cite la GRC qui dit qu'il ne peut rien faire auprès des acheteurs de salvia aussi longtemps que le gouvernement n'a pas légiféré pour rendre le produit illégal.)

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.

- When salvia products are sold for the purposes of modifying organic function (such as, for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.

**Q2 - Est-ce que la vente du salvia est toujours autorisé ou non au Canada?**

- As previously indicated, salvia products sold for the purposes of modifying organic function (such as, for their hallucinogenic effect) are regulated as NHPs in Canada. To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.
- Unauthorized drugs and NHPs may be subject to compliance and enforcement action by Health Canada. Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.
- Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Hello,

I have pulled these responses from last weeks approved response to the Canadian Press. As I am not fully bilingual, I am not sure if these responses completely answer the questions so your suggestions are very welcome.

If you are both OK with using these responses, I don't think any approvals will be necessary and we can just send to Christelle for translation. Let me know.

Hi Jocelyn,

Further to our teleconference this morning with HPFB, below for your review and approval are the revised responses. The text in red represents HPFB's proposed changes, while the text in blue is ours (Daniel suggested this bullet be kept, but put at the end of the response).

On a side note, the last bullet in the response to Q1 is taken directly from the draft IYH. That being said, would it not be more accurate to say "Canadians should not *consume*..." rather than "Canadians should not use.."?

Subject: Fw: DEMANDE MÉDIA - Salvia (RNC Media - Abitibi-Témiscamingue)

Hello,

I have pulled these responses from last weeks approved response to the Canadian Press. As I am not fully bilingual, I am not sure if these responses completely answer the questions so your suggestions are very welcome.

Hi again,

Will it be possible for us to get a response from you by 2:30 today? We won't be able to get another extension on this call so we will have to close it shortly.

Thanks in advance.

Hi,

Here's what we are proposing as the revised response. Please confirm with your program folks that they are comfortable with this before sending along to MR.

As mentioned, we can also use parts of this to respond to the Cambrian College student's question that just came in.

Cheers,  
Beth

Q1 - Est-ce illégal ou simplement pas encore autorisé au Canada? (L'article cite la GRC qui dit qu'il ne peut rien faire auprès des acheteurs de salvia aussi longtemps que le gouvernement n'a pas légiféré pour rendre le produit

illégal.)

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- When salvia products are sold for the purposes of modifying organic function (such as, for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.

**Q2 - Est-ce que la vente du salvia est toujours autorisé ou non au Canada?**

- As previously indicated, salvia products sold for the purposes of modifying organic function (such as, for their hallucinogenic effect) are regulated as NHPs in Canada. To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.
- Unauthorized drugs and NHPs may be subject to compliance and enforcement action by Health Canada. Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.
- Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Hi Nicole

Denis et al in OCS had a teleconf with HPFB this morning (Christine was on the call) and both sides have agreed to the following, with a few last revisions from me. Don't believe they warrant approval by HPFB again but that is up to you! Red text from HPFB, blue and strikeouts from OCS.

Approved for OCS

Jocelyn

**Q1 - Est-ce illégal ou simplement pas encore autorisé au Canada? (L'article cite la GRC qui dit qu'il ne peut rien faire auprès des acheteurs de salvia aussi longtemps que le gouvernement n'a pas légiféré pour rendre le produit illégal.)**

- When salvia products are sold for the purposes of modifying organic function (such as, for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act* .

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* .

To date, Health Canada has not licensed for sale any drug or NHP which contains salvia as an ingredient.

- Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and

their impact on physical and mental functions.

**Q2 - Est-ce que la vente du salvia est toujours autorisé ou non au Canada?**

- As previously indicated, salvia products sold for the purposes of modifying organic function (such as, for their hallucinogenic effect) are regulated as NHPs in Canada. To date, Health Canada has not ~~licensed for sale~~ approved any drug or NHP for sale which contains salvia as an ingredient.
- ~~Unauthorized drugs and NHPs may be subject to compliance and enforcement action by Health Canada.~~ Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.
- Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted

[DD/MM/2010]

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both substances should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stem.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type

II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

October

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a *natural health product monograph* prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances, <sup>included those substances that are</sup> substances that are traditional medicines or that are homeopathic medicines, and <sup>that of which</sup> none of the ingredients are substances set out on Schedule 2 which is a list of excluded substances, <sup>Excluded substances include</sup> e.g. any substance listed on Schedules I to V of the ~~Controlled Drugs and Substances Act~~ <sup>CDSA</sup>. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 and thus Schedule F to the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it and manufactured, sold or represented for that purpose, meet the definition of an NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by

Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling ~~of the substance~~;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability ~~of the substance~~;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's (Standard for the Uniform Scheduling of Drugs and Poisons) on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

---

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware,<sup>(6)</sup> Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.<sup>7</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens {reference?}. Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at  $\kappa$ -opioid (KOR) receptor.<sup>8</sup> Its mechanism of action is therefore unique.<sup>9</sup>

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

<sup>8</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A.* 2002 Sep 3;99(18):11934-9.

<sup>9</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>10</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>11</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>12</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>13</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>14</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>15</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>17</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>19</sup>

<sup>18</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>19</sup> Arasteh K, Poudevida S, Farre M, Roset PN, Cami J. Response patterns of the Spanish version of the 49-item short form of the Addiction Research Center Inventory after the use of sedatives, stimulants, and opioids. Drug Alcohol Depend. 1999 Jun 1;55(1-2):117-25.

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>20</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>21</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>22</sup>

Smoking is by far the most popular method of administration<sup>23</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>24</sup>

#### **4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses**

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>25</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>26</sup> Its main use today is, however, for its psychedelic properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>27</sup>

<sup>27</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>28</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>29</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>30</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is ~~sometimes sold~~ <sup>also marketed</sup> as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize ~~its use as incense~~ <sup>such a use</sup>. Therefore it is believed that the marketing of this plant as an incense is a recent invention to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>31</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and

humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>32</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on effects are also required. *in order to fully understand the addiction potential of this substance.*

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>33</sup> Given that only small doses of this substance are necessary to achieve the desired effects, there is a higher potential for abuse. The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>34</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>35</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>36</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>37</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the

<sup>37</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

experience, persisting negative effects (most often anxiety),<sup>38</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>39</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>40</sup>

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

<sup>38</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>39</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>40</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

(Number of Items/Exhibits)

Source	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009*

<b>TOTAL</b>	0	0	1	1	2	8	12	12	70	34

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January - May data in 2009.

once again it is difficult to determine how this data can be used to reflect the actual extent of abuse of S.d. & S.a. in the USA.

**4.2.6 Risk to Personal and Public Health and Safety**

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as

~~alcohol and cannabis, the actual use of *S. divinorum* is quite low.~~

*Infectious* The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>41</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>42</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and ~~none of these have advised that the use of *S. divinorum* poses any threat to public safety.~~ The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>43</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>44</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>45</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

<sup>44</sup> Singh S. (2007) Adolescent salvia substance abuse. Addiction. 102, 823-824.

<sup>45</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

they purchase. A study by Wolowich *et al.* (2006)<sup>46</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

that Health Canada has ~~only anecdotal~~ <sup>some</sup> information about the use and abuse of *S. divinorum* in Canada ~~as well as the threat~~ <sup>as well as the</sup> *S. divinorum* may pose <sup>to the</sup> health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting. ~~Considering also the limited population exposure information, it is not possible to adequately characterize the risk to the general population.~~ <sup>that</sup>

## 5. ASSESSMENT OF RISKS AND BENEFITS

## 6. IDENTIFICATION AND ANALYSIS OF OPTIONS

<sup>46</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>47</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>48</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>49</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, ~~according to available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis.~~ *there does not yet appear to be an increase in reported use of this substance.*

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the *marketing* labeling of the product indicates that it is to be used for human consumption and can modify an organic function.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the (previously-described) criteria upon which scheduling decisions are made within the Healthy Environments and Consumer Safety Branch (HECSB). In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

<sup>47</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.reserach.hazelden.org](http://www.reserach.hazelden.org).

<sup>48</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>49</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

Neither *Salvia divinorum* <sup>and</sup> nor salvinorin A <sup>appear to</sup> meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are also currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding abuse in Canada.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that ~~though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.~~ <sup>and ~~priority~~ law enforcement has no means to prevent its sale.</sup>

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. The CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both substances should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stem.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type

---

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: *Salvia Divinorum* (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a *natural health product monograph* prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by

Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### ***Denmark***

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### ***Spain***

---

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

## **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.<sup>7</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

<sup>8</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

<sup>9</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A.* 2002 Sep 3;99(18):11934-9.

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination

<sup>19</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>26</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the

stomach.<sup>27</sup> Its main use today is, however, for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>30</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>31</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a recent invention to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>32</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

<sup>31</sup> Prisinzano TE. Natural products as tools for neuroscience: discovery and development of novel agents to treat drug abuse. *J Nat Prod.* 2009 Mar 27;72(3):581-7.

<sup>32</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman’s The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>33</sup> Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>34</sup> Given that only small doses of this substance are necessary to achieve the desired effects, there is a higher potential for abuse. The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>35</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>36</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>37</sup>

Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>38</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>39</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>40</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>41</sup>

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and

- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

STRIDE <sup>2</sup>	0	0	1	1	1	0	0	0	N/A	N/A
<b>TOTAL</b>	0	0	1	1	2	8	12	12	70	34

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

Once again, it is difficult to determine how this data can be used to reflect the actual extent of

abuse of *S. divinorum* and salvinorin A in the United States.

#### **4.2.6 Risk to Personal and Public Health and Safety**

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>42</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>43</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>44</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>45</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a

---

<sup>42</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>43</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. *Planta Med* 2007 Jun;73:1039-1046.

<sup>45</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction.* 102, 823-824.

s.21(1)(a)  
s.21(1)(b)

17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>46</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>47</sup>

Health Canada has some information about the use and abuse of *S. divinorum* in Canada that indicate that *S. divinorum* may pose a risk to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 5. ASSESSMENT OF RISKS AND BENEFITS

## 6. IDENTIFICATION AND ANALYSIS OF OPTIONS

<sup>46</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>48</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>49</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>50</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, there does not appear to be a significant increase in the reported use of this substance.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be used for human consumption and can modify an organic function.

*Salvia divinorum* and salvinorin A meet the criteria for scheduling a substance under the CDSA. While neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

<sup>48</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

s.21(1)(a)

s.21(1)(b)

While the potential for physical dependence of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and adolescents, and potential for risk to public health and safety.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. The CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both substances should be regulated as controlled substances in Canada.

→ this suggests they are different "substances"?

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the <sup>called</sup> mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stem.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

check in put initials in parentheses

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsurounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

upper case?  
actual title?

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by

for such products (2)

Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as with regard to modifying organic functions are made.  
regarding the modification of

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into ~~eight~~ Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:  
a number of → including:

- International requirements and trends in ~~the~~ control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 **Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

by way of example ...

#### **California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### **Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

#### **Maine**

/ Q: Any particular reason we focus on those 5 five.

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.<sup>7</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination

of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>26</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the

stomach.<sup>27</sup> Its main use today is, however, for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>30</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>31</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a recent invention to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>32</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>33</sup> Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>34</sup> Given that only small doses of this substance are necessary to achieve the desired effects, there is a higher potential for abuse. The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>35</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>36</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>37</sup>

Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62, Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5, and Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>38</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>39</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>40</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>41</sup>

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and

---

<sup>38</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>39</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

Once again, it is difficult to determine how this data can be used to reflect the actual extent of

abuse of *S. divinorum* and salvinorin A in the United States.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>42</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>43</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>44</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>45</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a

<sup>45</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction.* 102, 823-824.

17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>46</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>47</sup>

specific?

Health Canada has some information about the use and abuse of *S. divinorum* in Canada that indicate that *S. divinorum* may pose a risk to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 5. ASSESSMENT OF RISKS AND BENEFITS

## 6. IDENTIFICATION AND ANALYSIS OF OPTIONS

<sup>46</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

*Dature r*  
*Fin*  
The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>48</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>49</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>50</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, there does not appear to be a significant increase in the reported use of this substance.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be used for human consumption and can modify an organic function.

*Salvia divinorum* and salvinorin A meet the criteria for scheduling a substance under the CDSA. While neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

<sup>48</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>49</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>50</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

While the potential for physical dependence of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and adolescents, and potential for risk to public health and safety.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. The CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

Bonjour Suzanne,

We understand your concern and propose that an updated draft IAS be provided to CSS-WG members by close of business on Monday in preparation for discussion at the WG meeting. All major changes will be highlighted in this draft, in order to facilitate easier review.

We would then request that WG members provide comments by Thursday at noon. This plan would enable us to keep our commitment to provide Jocelyn with a draft IAS by Friday October 29th. Do you concur with this proposal?

Tiana

Hi Tiana,

I think that will be fine. Suzanne, could you please let me know if you are okay with this? I think the Agenda currently reflects this so it does not need to be changed.

Can you give me an idea of when you might be sending out the revised docs pertaining to the EAC for circulation to the CSS-WG before the meeting on Wednesday?

Thanks,

---

Hi Tiffany/Allison,

As discussed, RPD is in the process of updating the IAS on Salvia and have committed to providing a revised draft to Jocelyn by the end of the month. Therefore, we will not have sufficient time to provide to CSS-WG in advance. We simply want to confirm that Suzanne would be okay with us providing the updated IAS to CSS-WG for information following Jocelyn's review.

Pls advise if there are any concerns.

Much appreciated,  
Tiana

Controlled Substances and Tobacco Directorate

---

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether these substances should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stem.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which

---

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: *Salvia Divinorum* (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims regarding the modification of organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high

potential for abuse and risk to public health and safety.”<sup>3</sup> Schedule 9 is Australia’s most restrictive drug schedule, and includes “substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### ***Denmark***

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

---

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr2001111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

## ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

## ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

## ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S.*

*divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.<sup>7</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the

---

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. Life Sci. 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

<sup>8</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

<sup>25</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

Indians in Oaxaca, Mexico,<sup>26</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>27</sup> Its main use today is, however, for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>30</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>31</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a recent invention to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the

---

nucleus accumbens.<sup>32</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>33</sup> Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>34</sup> Given that only small doses of this substance are necessary to achieve the desired effects, there is a higher potential for abuse. The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>35</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>36</sup> However,

<sup>36</sup> Turner DM. *Salvinorin - The Psychedelic Essence of Salvia Divinorum*. Panther Press, San Francisco, CA 1996.

another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>37</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>38</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>39</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>40</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>41</sup>

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup>

<sup>39</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>40</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry.* 2005 Jan;38(1):1-5.

<sup>41</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

- graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

(Number of Items/Exhibits)

Source	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009*
NFLIS-State/Local <sup>1</sup>	0	0	0	0	1	8	12	12	70	34
STRIDE <sup>2</sup>	0	0	1	1	1	0	0	0	N/A	N/A
<b>TOTAL</b>	0	0	1	1	2	8	12	12	70	34

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>42</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>43</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount

<sup>42</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>43</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

s.21(1)(a)

s.21(1)(b)

of smoke from burning dried leaves.<sup>44</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>45</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>46</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>47</sup>

Information found in scientific literature about the use and abuse of *S. divinorum* indicates that *S. divinorum* may pose a risk to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>49</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>50</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>51</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, there does not appear to be a significant increase in the reported use of this substance.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-

<sup>49</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

s.21(1)(a)

s.21(1)(b)

sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be used for human consumption and can modify an organic function.

*Salvia divinorum* and salvinorin A meet the criteria for scheduling a substance under the CDSA. While neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the potential for physical dependence of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and adolescents, and potential for risk to public health and safety.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. The CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

Subject: Salvia IAS - revised

Hi Denis,

I have included the revisions suggested by you and Daniel in the draft IAS below.  
[attachment "Draft Salvia Divinorum IAS\_Oct 25 2010.doc" deleted by Daniel Galarneau/HC-SC/GC/CA]

Would you like a chance to review it before I forward to Tiffany in the CSS-WG?

Regards,

Stephanie

Optional:	Isabel Shanahan/HC-SC/GC/CA@HWC, Laura Cooney/HC-SC/GC/CA@HWC, Valence Nebie/HC-SC/GC/CA@HWC

#### Description

Here is the draft agenda for Wednesday October 27th from 10:30 to 12pm in Rm 405A, 123 Slater. The meeting is a few weeks later due to scheduling conflicts. If you have any other items you would like to contribute please let me know.

Thanks,  
Tiffany

#### Draft Agenda

- 1- Members' introduction
- 2- Approval of Agenda
- 3 - Approval of ROD from August 2010  
-recommendation on scheduling Salvia
- 4- Update on CDSA Scheduling Process  
- ADM briefing (Jocelyn)
- 5- Update  
- updates on any emerging issues relevant to the WG's activities
- 6- Next steps i.e next meeting scheduled for October 13th

#### August 2010 ROD:

CSS-WG Aug 2010 Meeting RODt.doc

# Issue Analysis Summary

DRAFT

## Scheduling *Salvia Divinorum* and/or Salvinorin A under the CDSA

Regulatory Policy Division  
Office of Controlled Substances

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its main active ingredient salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an

ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether these substances should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stem.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which

---

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims regarding the modification of organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high

potential for abuse and risk to public health and safety.”<sup>3</sup> Schedule 9 is Australia’s most restrictive drug schedule, and includes “substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### ***Denmark***

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S.*

*divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.<sup>7</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the

---

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. Life Sci. 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

<sup>8</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

available research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include the sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

<sup>25</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

Indians in Oaxaca, Mexico,<sup>26</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>27</sup> Its main use today is, however, for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>30</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>31</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a recent invention to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the

nucleus accumbens.<sup>32</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out. Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>33</sup> Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>34</sup> Given that only small doses of this substance are necessary to achieve the desired effects, there is a higher potential for abuse. The extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>35</sup>

#### **4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally**

In Canada, the extent of actual abuse of *Salvia divinorum* and/or salvinorin A is relatively unknown. There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>36</sup> However,

<sup>36</sup> Turner DM. *Salvinorin - The Psychedelic Essence of Salvia Divinorum*. Panther Press, San Francisco, CA 1996.

another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>37</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>38</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>39</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>40</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>41</sup>

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup>

- graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States.

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>42</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>43</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the physiological and psychotropic effects of *S. divinorum* use have been published in the academic literature. An international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount

<sup>42</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>43</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

s.21(1)(a)

s.21(1)(b)

of smoke from burning dried leaves.<sup>44</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>45</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>46</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>47</sup>

Information found in scientific literature about the use and abuse of *S. divinorum* indicates that *S. divinorum* may pose a risk to the health and safety of Canadians. There are several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 5. ASSESSMENT OF RISKS AND BENEFITS

de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>49</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>50</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>51</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, there does not appear to be a significant increase in the reported use of this substance.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-

s.21(1)(a)

s.21(1)(b)

sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be used for human consumption and can modify an organic function.

*Salvia divinorum* and salvinorin A meet the criteria for scheduling a substance under the CDSA. While neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the potential for physical dependence of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and adolescents, and potential for risk to public health and safety.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. The CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

Controlled Substances and Tobacco Directorate

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*), which is currently not regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the

*S. divinorum*

**Comment [S2]:** There is total inconsistency throughout the document regarding the name; the name should be the same throughout

**Comment [S3]:** I don't believe there has been many enquiries regarding and/or salvinorin A specifically

availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether these substances should be regulated as controlled substances in Canada.

**Comment [S4]:** While the effects of salvinorin A were considered, the assessment was not made on "and/or salvinorin A"

**Deleted:** and/or salvinorin A

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene, which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

**Deleted:** (also referred to chemically as

**Deleted:** )

**Deleted:** is

*Salvia divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not represented as a health product or hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of HECS????, in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

Deleted: an  
Deleted: discussion

On September 13, 2007, a further meeting between (the then) DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### 4.1 Relevant Legislative Frameworks in Canada

##### 4.1.1 Food and Drug Regulations (under the Food and Drugs Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

Robin wrote

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the

F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims regarding the modification of organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *Salvia divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

**Deleted:** is illegal to possess or sell

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" but this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying salvia as a Schedule I drug. This Schedule includes substances such as LSD and marijuana.

**Deleted:** which

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### Maine

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### North Carolina

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

**Comment [S5]:** Since these are considered legitimate uses, it should be reflected in section 4.2.3

### Tennessee

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

**Comment [S6]:** Same comment as for North Carolina

#### 4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup>

Salvinorin A is an hallucinogen with a distinct structure, and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available

**Comment [HABR7]:** There is little evidence that the terpenoids in cannabis are psychotropic. They are hypothesized to "possibly" contribute to the "high" but there is very little in the way of conclusive evidence on that (vs. what is known about cannabinoids). Terpenoids are mainly thought to contribute to the smell of cannabis. I also don't think this part is really relevant and should be removed.

**Deleted:** Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*.

**Deleted:** Unlike all other hallucinogens, s

**Deleted:** distinct

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. Life Sci. 2005 Dec 22;78(5):527-31.

<sup>8</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

research suggests the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Deleted: are the quickest

Deleted: onset of

Deleted: powder occurs

Deleted: and effects

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

Deleted: Smoking

Deleted: and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

Deleted: recent invention

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed limiting further studies investigating their therapeutic use<sup>30</sup>. In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder,<sup>31</sup> but there has been no clinical research to support these hypotheses. That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

\* decorative purpose

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive. In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of

MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>34</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>35</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>36</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>37</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>38</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic

effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 human doses.<sup>42</sup>

**Deleted:** re is a higher

**Comment [HABR13]:** Oral doses?

**Deleted:** extent of actual abuse of

**Deleted:** and/or salvinorin A is relatively unknown.

**Deleted:** There is, however, some data regarding the prevalence of use of *Salvia divinorum* in Canada, despite the lack of legitimate uses for this plant.

**Deleted:** It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and ... [1]"

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of the use *Salvia divinorum* has recently been documented. Questions about the use of *S. divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6%

<sup>41</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

<sup>49</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;

- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

**Deleted:** <#>There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.¶

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. *Salvia* appears however to be a substances that is tried largely by youth with a 7.3% prevalence of lifetime use.

**Deleted:** The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.¶

**Deleted:** .

**Deleted:**

**Deleted:** had used

**Deleted:** used

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, as shown in the following table. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

text

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

*text*

Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States.

*only seizures  
etc legal  
seized by accident  
think it something  
else.*

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise, but it may also only reflect an increased awareness of the phenomenon.

Deleted: ¶

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>49</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>50</sup>

Deleted: The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population. ¶

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount

s.21(1)(a)

s.21(1)(b)

of smoke from burning dried leaves.<sup>51</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>52</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>53</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>54</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

5. ASSESSMENT OF RISKS AND BENEFITS

*of substance?*

6. IDENTIFICATION AND ANALYSIS OF OPTIONS

**Deleted:** Information found in scientific literature about the use and abuse of *S. divinorum* indicates that *S. divinorum* may pose a risk to the health and safety of Canadians. T

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults are smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other drug promotion sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

**Comment [S19]:** Should also reference CADUMS

**Deleted:** have begun

**Comment [S20]:** We don't know about increase/decrease use

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be used for human consumption and can modify an organic function.

**Deleted:** While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, there does not appear to be a significant increase in the reported use of this substance. ¶

regulation  
vs  
non-regulatory.

*Salvia divinorum* and salvinin A meet the criteria for scheduling a substance under the CDSA. While neither the plant nor salvinin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and potential for health risks as well as risks to public health and safety.

**9. CONSULTATIONS**

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

**s.21(1)(a)**  
**s.21(1)(b)**

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* and salvinorin A to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of these substances. After assessing the available information against the 6 criteria, the CSS-WG recommended that both *S. divinorum* and salvinorin A be included under Schedule III to the CDSA.

**Comment [S21]:** Need a para regarding whether to schedule salvia and/ salvinorin a; that was not discussed by the WG  
**Deleted:** Th

**10. IMPLEMENTATION AND EVALUATION**

s.21(1)(a)  
s.21(1)(b)

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>1</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>2</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>3</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>4</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>5</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>6</sup>

From: OCS-BSC/HC-SC/GC/CA  
To: [REDACTED]  
Date: 2010-10-26 10:44 AM  
Subject: Legal status of Salvia

---

Dear [REDACTED]

I am writing in response to your email enquiry dated October 6, 2010, in which you have requested information concerning the legal status of Salvia.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). However, when *S. divinorum* is marketed with a claim to modify brain function (such as for use as a hallucinogen), it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). It is illegal to manufacture, sell or provide natural health products without their being authorized by Health Canada prior to sale. As of October 2010, no such products containing *S. divinorum* or salvinorin A have been authorized for sale by Health Canada.

*Salvia divinorum* products that are not in compliance with the NHPR may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Health Canada is currently reviewing all the available information regarding *Salvia divinorum* to determine whether it should be regulated under the CDSA.

Please do not hesitate to contact me should you have any further questions.

001522

Sincerely,

Jocelyn Kula  
A/Director

## Scheduling Substances under the *Controlled Drugs and Substances Act*

CSS-WG Discussion  
October 27, 2010

Canada

---

---

---

---

---

---

---

---

### OUTLINE

- Purposes
- Background
- Proposed EAC
- Draft CDSA Scheduling Policy Document
- CDSA Scheduling Process
- Proposed Next Steps

---

---

---

---

---

---

---

---

### PURPOSES

1. To present a draft policy setting out the process by which substances are scheduled under the *Controlled Drugs and Substances Act* (CDSA)
2. To seek approval to consult stakeholders on a draft policy that proposes the establishment of an Expert Advisory Committee (EAC) to support CDSA scheduling

---

---

---

---

---

---

---

---

### BACKGROUND (1)

- In 2007, stakeholders criticized the transparency and rigour of the CDSA scheduling process
  - Former ADM launched the Scheduling Transparency Project
- In response to recommendations presented in a 2008 external contractor review of CDSA scheduling process:
  1. The Controlled Substances Scheduling Working Group, a HECSB-HPFB committee, has been established to coordinate CDSA scheduling assessments and improve the timing of info-sharing between Branches
  2. HC will continue to publish Notices to Interested Parties in *Canada Gazette* (CG) Part I to provide public with (a) an opportunity to comment on proposals and (b) a point of contact for those seeking more info

---

---

---

---

---

---

---

---

### BACKGROUND (2)

3. CSTD has developed a draft public policy document describing the CDSA scheduling process, including the key scheduling factors
  4. CSTD has decided to publish decision documents, similar to HPFB Summary Basis of Decisions, which will enhance transparency of CDSA scheduling process
- In addition, the 2008 External Review highlighted that many jurisdictions, e.g., US, UK, EU, Australia, New Zealand, etc. have an expert/external advisory committee to support their scheduling process

---

---

---

---

---

---

---

---

### PROPOSED EAC (1)

- **Rationale** – Stakeholders demanding for more openness and transparency in regulatory decision-making has led to a call for greater defensibility
- **Mandate** - To provide CSTD with expert medical/scientific advice on:
  - Addiction liability, potential for abuse, health risks, etc. of a substance
  - How a substance under review compares, based on the factors identified above, to substances currently scheduled under the CDSA
  - Any other issues/questions presented by the DG, CSTD

---

---

---

---

---

---

---

---

### PROPOSED EAC (2)

- **Membership** - experts on abuse, addiction, pharmacology of substances of abuse, epidemiology
  - Ad hoc representation of law enforcement, criminology, social work
- **Examples of EAC Role/Function:**
  - Determine how to Salvia and other plants with psychoactive properties that are currently unscheduled, e.g., Jimson Weed, morning glory, compare with substances scheduled under CDSA
  - Independently review abuse and addiction data in controversial cases, e.g., tramadol, in order to further support the defensibility of scheduling assessments

---

---

---

---

---

---

---

---

### CDSA SCHEDULING PROCESS (1)

- 1. Substance Identification**
  - United Nations decision to schedule substances under international drug control conventions
  - Info on abuse/addiction/liability/other risk of substance
- 2. Info Collection and Preliminary Review**
  - Info collected from a variety of sources
  - CSS-WG establishes substance profile and determines whether sufficient info for CDSA scheduling assessment, could request advice from proposed EAC
- 3. Notice to Interested Parties in CG, Part I (optional)**
  - Notices not be published for new pharmaceuticals

---

---

---

---

---

---

---

---

### CDSA SCHEDULING PROCESS (2)

- 4. CDSA Scheduling Assessment**
  - Development of an Issue Analysis Summary (IAS) reflective of available info, assessing substance against 6 CDSA scheduling factors
  - CSS-WG reviews IAS and makes a scheduling recommendation
  - CSS-WG could recommend that advice be sought from proposed EAC before finalising its recommendation
- 5. Scheduling Decision**
  - CSS-WG makes scheduling recommendation to CSTD senior management for approval

---

---

---

---

---

---

---

---

### CDSA SCHEDULING PROCESS (3)

#### 6. Federal Regulatory Process

- Pre-publication of proposed regulation in CG Part I with comment period (minimum of 30 days)
- CSS-WG could request advice from the EAC on issues/questions raised during this process
- Development of final regulation and publication in CG Part II

#### 7. Public Notification of Scheduling Decision

- CDSA Scheduling Decision document published on HC website to provide a summary of scientific info considered during CDSA scheduling assessment
- Confidential business information and other sensitive info will not be disclosed, in accordance with the *Privacy Act*

10

---

---

---

---

---

---

---

---

### PROPOSED NEXT STEPS

- **Fall 2010:** ADM decision on including the proposed EAC in the draft CDSA scheduling policy for external consultation
- **Winter 2010:** release of draft *Policy on the Scheduling of Substances under the CDSA* for external consultation
- **Spring 2011:** Consultation of key stakeholders, e.g., relevant industries, trade associations, national associations, P/T licensing authorities for pharmacy, medicine, etc.
- **Fall 2011:** Release of final CDSA Scheduling Policy for Controlled Substances

11

---

---

---

---

---

---

---

---

Shouldn't Salmia<sup>IAS</sup> have:  
1 - gone to Jk for approval  
2 - NOI  
3 - CSS-WG reviews IAS  
?

- DG sign off before  
Notice of Intent?

**Fw: NHP Importation (for Salvia IAS)**

**NHP Importation (for Salvia IAS)**

Courtney Smith to: Denis Arsenault

2010-10-27 05:51 PM

Cc: Tiffany Thornton

---

As discussed. Something to this effect may clarify statements relating to import under the NHPR in the 'context' and the 'options'.

*S. divinorum* can be legally imported and sold in Canada. However, if an *s.divinorum* product is marketed with a health claim, it would meet the definition of an NHP. This means that while the domestic sale, and the importation for sale, of these products would be prohibited in the absence of a market authorization, importation of limited quantities for personal use would be permitted. Therefore this substance is easily accessible.

I will have to follow up regarding the availability of border stats (I'm unsure if we have this information available).

# Issue Analysis Summary

DRAFT

## Scheduling *Salvia Divinorum* under the CDSA

Regulatory Policy Division

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*,) which is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the

availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether these substances should be regulated as controlled substances in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled

---

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)**

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application. In this application, the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. The applicant may also submit a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally

marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims regarding the modification of organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *S. Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### ***Denmark***

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", but this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering *classifying S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture

and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup>

Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available

<sup>8</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

research suggests<sup>9</sup> the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, <sup>and</sup> while the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

<sup>19</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

<sup>25</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

Indians in Oaxaca, Mexico<sup>(26)</sup> For medicinal purposes (gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach)<sup>(27)</sup> an infusion of the leaves or the leaves themselves are ingested. (However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>29</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>30</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>31</sup> but there has been no clinical research to support these hypotheses. That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR<sup>(32)</sup> selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>33</sup> In addition, KOR agonists have analgesic properties<sup>(34)</sup> but are not associated with respiratory

<sup>26</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>33</sup> Killinger BA, Peet MM, Baker LE. Salvinorin A fails to substitute for the discriminative stimulus effects of LSD or ketamine in Sprague-Dawley rats. Pharmacology, Biochemistry & Behaviour. 2010 May 96; 260-265.

depression like MOR agonists.<sup>34</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>35</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>36</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>37</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>38</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>39</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>40</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>41</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>42</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse.

In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>43</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>44</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of <sup>of</sup> the use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. In some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia".

---

Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

<sup>43</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>44</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and
- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had

---

<sup>51</sup> Siebert DJ. Salvia divinorum and salvinin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. Salvia appears, however, to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that *S. divinorum* is not an illegal substance and would likely only be seized accidentally or during the seizure of other illicit substances.

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as both these substances are not listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise, <sup>no users</sup> but it may also only reflect an increased awareness of the phenomenon.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>51</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-

term effects of *S. divinorum* use.<sup>52</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>53</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>54</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>55</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>56</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 5. ASSESSMENT OF RISKS AND BENEFITS

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum* were also considered, such as the development of an educational campaign to highlight the risks associated with using this plant. However, ~~given~~ the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and potential for health risks as well as risks to public health and safety.

individual

s.21(1)(a)  
s.21(1)(b)

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, ~~also~~ be scheduled. <sup>gives</sup> Salvinorin A can easily be extracted from *S. divinorum* and this substance ~~results in~~ the plant's <sup>is</sup> hallucinogenic properties. Therefore salvinorin A results in the same risks as *S. divinorum* and ~~its scheduling will mitigate such threats to the personal and public health and safety of Canadians.~~ <sup>AND should also be controlled under the CDSA.</sup>

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's <sup>for sale</sup> hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

Hi Stephanie

No, they wouldn't; like the information on US seizures included in the IAS, this info would only demonstrate that the products are present. It would not give any indication of prevalence.

Hi Courtney,

Thanks for your input below.

Also FYI, we have contacted the Border Integrity unit in the past, and we were told that given the lack of regulatory control of salvia, if such stats were available, they wouldn't adequately describe the actual quantities of salvia being imported.

Regards,

Stephanie

Subject: Salvia - American stats for CSS-WG draft doc

Suzanne,

I did online searches for data on salvia use from USA surveys. (For input to CSS-WG meeting document)

Below is the only information I was able to find.

- 1 - data from 2009 Monitoring the Future for 12th grade students, past year use.
- 2- stats from 2006 National Survey on Drug Use and Health on salvia use, lifetime, past year by age groups.

**1- 2009 Monitoring the Future**

- Annual prevalence among 12th graders: 5.7%(Question was only asked to 12th graders)

## 2- SAMHSA's 2006 National Survey on Drug Use and Health

- According to the 2006 National Survey on Drug Use and Health of persons aged 12 or older, 1.8 million used *Salvia divinorum* at least once in their lifetime;

756,000 used the drug in the past year.

source:

- Among youth aged 12 to 17, males were more likely than females to have used *Salvia divinorum* in the past year (0.9% vs. 0.3%)

- In 2006, young adults aged 18 to 25 were more likely than youths aged 12 to 17 or adults aged 26 or older to be past year users of LSD, Ecstasy, and *Salvia divinorum*.

Subject: NHP Importation (for Salvia IAS)

---

As discussed. Something to this effect may clarify statements relating to import under the NHPR in the 'context' and the 'options'.

*S. divinorum* can be legally imported and sold in Canada. However, if an *s. divinorum* product is marketed with a health claim, it would meet the definition of an NHP. This means that while the domestic sale, and the importation for sale, of these products would be prohibited in the absence of a market authorization, importation of limited quantities for personal use would be permitted. Therefore this substance is easily accessible.

I will have to follow up regarding the availability of border stats (I'm unsure if we have this information available).

Hi Allison,

Just wanted to check if you had received any other comments from the CSS-WG regarding the Salvia IAS. I received your comments with regard to US stats and comments from Courtney Smith, but I haven't received any from NHPD. I believe Robin was going to forward you them by noon today?

We'd like to send the draft IAS to the Director, OCS by COB today, so if you could forward any other comments ASAP it would be greatly appreciated.

Thanks!

Stephanie

Hi Stephanie,

I am forwarding comments from Evelyn on to you.

Other than Suzanne, which you were copied on, I have not received any further comments.

Thanks!

Hi Allison

Sorry I haven't had much time to review this as I have been out of the office most of this week but I added one comment on p.2 to change substances to substance.

Cheers

Evelyn

Subject: NHP Importation (for Salvia IAS)

As discussed. Something to this effect may clarify statements relating to import under the NHPR in the 'context' and the 'options'.

*S. divinorum* can be legally imported and sold in Canada. However, if an *s. divinorum* product is marketed with a health claim, it would meet the definition of an NHP. This means that while the domestic sale, and the importation for sale, of these products would be prohibited in the absence of a market authorization,

importation of limited quantities for personal use would be permitted. Therefore this substance is easily accessible.

I will have to follow up regarding the availability of border stats (I'm unsure if we have this information available).

Controlled Substances and Tobacco Directorate

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*), which is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the

**Deleted:** not

availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene, which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled

substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

Deleted: an  
Deleted: HECS????  
Deleted:  
Deleted: discussion  
Deleted: ) (

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

Deleted: (the then)

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### 4.1 Relevant Legislative Frameworks in Canada

##### 4.1.1 Food and Drug Regulations (under the Food and Drugs Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

Deleted: ¶

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The Natural Health Products Regulations (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

Deleted: The Natural Health Products Regulations (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to the submission of a product license application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate or submission of a product license application that provides sufficient evidence of quality, safety and efficacy that is assessed and approved by NHPD by the non-compendial route. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR. ¶

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada so no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 Assessment of *S. Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

*Australia*

**Deleted:** The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 to the NHPR, which is a list of included substances. Included substances are those substances that are traditional or homeopathic medicines, and of which none of the ingredients are substances set out in Schedule 2, which is a list of excluded substances. Excluded substances include any substance listed on Schedules 1 to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR. As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.¶

¶ As of October 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims regarding the modification of organic functions are made.¶

**Deleted:** *Salvia*

**Deleted:** *alvia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

Deleted: alvia

Deleted: is illegal to possess or sell

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", but this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marijuana.

Deleted: which

Deleted: salvia

Deleted: a

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### **California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### **Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture

and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### Maine

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### North Carolina

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### Tennessee

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### 4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure, and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the

$\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

Deleted: while

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Deleted: Salvia

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Deleted: are the quickest

Deleted: onset of

Deleted: powder occurs

Deleted: and effects

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

Indians in Oaxaca, Mexico,<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>28</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>30</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>31</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder, but there has been no clinical research to support these hypotheses.<sup>33</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by

MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>35</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>36</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>37</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

Deleted:  $\mu$ -opioid receptor (

Deleted: )

Formatted: Superscript

Formatted: Superscript

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>38</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>39</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>40</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>41</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>42</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>43</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of

Deleted: Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. S

tolerance.<sup>44</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>45</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>46</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. In some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia".

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *salvia* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *salvia* in the last twelve months; and
- Males (6.6%) were more likely to have used *salvia* in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined *salvia* for the first

**Deleted:** It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>47</sup> However, another study suggested that this is not the experience of all ... <sup>53</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. Salvia appears however to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that *S. divinorum* is not an illegal substance and would likely only be seized accidentally or during the seizure of other illicit substances.

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as both these substances are not listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may only reflect an increased awareness of the phenomenon.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>53</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-

term effects of *S. divinorum* use.<sup>54</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>55</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>56</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

Deleted: academic  
Deleted:  
Deleted: A

Deleted: Salvia

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>57</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>58</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

Deleted: Information found in scientific literature about the use and abuse of *S. divinorum* indicates that *S. divinorum* may pose a risk to the health and safety of Canadians. T

de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

### 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum* were also considered, such as the development of an educational campaign to highlight the risks associated with using this plant. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore salvinorin A results in the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

de la Loi sur l'accès à l'information**

---

Page 14: [1] Deleted SDESJARD 2010-10-26 3:43:00 PM

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>1</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>2</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>3</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>4</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>5</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>6</sup>

---

Page 14: [2] Deleted SDESJARD 2010-10-26 3:43:00 PM

There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

---

Page 14: [3] Comment [S10] STCHANDL 2010-10-27 4:20:00 PM

Survey specifically asked about "salvia" rather than *S. divinorum* or salvinorin A

---

Page 14: [4] Deleted SDESJARD 2010-10-26 3:44:00 PM

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

Page 15: [7] Deleted SDESJARD 2010-10-26 3:48:00 PM

The increase in both the number of enquiries from various municipalities and members of the public and the amount of media interest regarding the availability of *Saliva divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population.

Hi Jocelyn,

Yes this version does include all the comments from ODARS. The CSS-WG had no major comments on our adjusted recommendations, but they did have some comments on the body of the IAS (though it had not changed substantially since it was last reviewed by the working group in August).

At the meeting it was also confirmed that, in accordance with the CSS-WG process, once a Notice of Intent has been published for Salvia and public comments received, the IAS will go back to CSS-WG again.

Let me know if you have any questions.

Clarke and Graham

Further to your questions this morning about Salvia - I have confirmed with NHPD that my information is correct. Products containing salvia are would only be considered a NHP (and subject to the NHP regulations) if they make a health claim.

- If the ingredient salvia is found in a product AND it the product makes a health claim, then the product would be considered a NHP

- if the ingredient is found in a product BUT DOES NOT make a health claim, then it would NOT be considered a NHP

As I mentioned, we would look at each situation on a case by case basis - there can be gray areas with respect to the claim. You mentioned one of them: if they have a website making a claim or if a retailer is making a claim. We would look at these situations carefully to determine if they are NHP claims. If its a website, we would likely ask that the claim be removed from the website.

- With respect to the status of scheduling Salvia as a controlled substance, we have not been able to reach HECs ADMO this morning. I would suggest that you follow-up directly with Heidi Jackson.

Thanks (and sorry for the delay)

sorry everyone, I should have checked my files earlier.

FYI

There is a meeting of the HECS Exec Subcommittee on Science Policy, (Chaired by Beth and on which Ivan Ross and I are members), scheduled for this Friday. On the Agenda is Beth's de-brief of the "EC SRM forward agenda". Among the documents sent in preparation for our meeting is the list of proposed topics; Salvia is listed but unscheduled. Salvia is identified as a Natural Health Product with the issue being "potential for abuse/dependence (CDSA discussion with OCS)"; the lead identified is HPFB/HECS. Looking at the list of "what items should be brought to EC-SRM", it is not clear to me why Salvia has been

identified. Also of interest to us would be an issue from Legal services regarding litigation from the perspective of how it affects HC -How HC officials are implicated, resources....(topic also not yet scheduled)

I will let you know what more I learned from my meeting on Friday on this issue and on how the 2 committees are related.

Controlled Substances and Tobacco Directorate

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) which is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the

youth

Q: Are we talking *S. divinorum* (plant) or Salvinorin A (substance) or both?

availability of *S. divinorum* in Canada.

3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

have assess and which we are recom

4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

for schedule I know you get there in the end

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

but

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

marketed as a

all the up front is

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Salvia only?

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy <sup>the</sup> Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the ~~the~~ Drug Strategy and Controlled Substances Directorate (DSCSD) (now Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
  - (b) restoration, correction or modification of organic functions in human beings or animals,
- or

(c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors ; including:

*including implies there are more not listed... 7*

*the following*

- International requirements and trends in ~~the~~ control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial <sup>or</sup> ~~or commercial~~ uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 **Assessment of *S. Divinorum* for Scheduling Purposes**

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella I" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale,

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

**Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

**Other Countries**

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

**United States of America**

*Administration*

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", ~~this~~ this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement ~~Agency~~ is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marijuana.

*At the state level, some state legislatures have*  
~~In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.~~

*of S. divinorum and/or salvinorin A.*

**California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

**Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human

consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the

*Diterpenes are a family of substance that contain terpenoids (need same sentence to link 1st 2 sentences)*

$\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the

increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because ~~the powder is~~ insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including (Therapeutic, Scientific, Industrial) ~~or Commercial Uses~~

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches,

rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,~~but~~ there has been no clinical research to support these hypotheses.<sup>30</sup> ~~That said~~ there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the

user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms ~~had~~ profound hallucinogenic

has

effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. [In some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia".] *would make this a footnote id.*

*It should be noted that...*

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and
- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

Inclusion,

had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. Salvia appears ~~however to~~ be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, <sup>the</sup> annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other ~~illicit~~ substances.

controlled (not all controlled subs are illicit)

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as ~~both these substances are not~~ listed in the *Controlled Substances Act*.

Agency Admini stration

neither is

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may ~~only~~ reflect an increased awareness of the phenomenon,

rather than an <sup>also</sup> increased incidence of use.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or

<sup>43</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup>

It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

s.21(1)(a)

s.21(1)(b)

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

of use (abuse same chronic to me)

the use of roses

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore, salvinorin A ~~results in~~ the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

s.21(1)(a)  
s.21(1)(b)

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

## 10. IMPLEMENTATION AND EVALUATION

Desjardins, Stephanie Chandler

Hi Lisa

According to our files, we started getting media enquiries on salvia in 2002, so from my perspective, that is when we would have started a file on it, and hence when we became aware of it as a psychotropic substance. I am not surprised that the date when MHPD became aware is different as to my knowledge, MHPD only became involved in salvia at all, when it received the four ADR reports that we sometimes reference .....

Suzanne- not sure what is on your files?

Subject: Question on Salvia

Hello all,

A question has come in from Chris Turner (DG MHPD) - The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention in the **spring of 2005**

MHPD first became aware of this in the "spring of 2005" is that the same for HECSB?

Thank you

Lisa Mackay

Hi Cathy,

I am just returning from the HECS-Science Policy meeting that Beth Chairs. The forward agenda for the EC-SRM meeting was discussed. Beth does not know how items were identified but she believed that one input was the combination of the forward agenda from the 2 committees that have been merged (i.e. SMB-Risk and SMB science). In any case, she will ask that Salvia be removed from the agenda at this time. If there is a desire later for Salvia to go to the Committee, we could make a request to that effect. Items will not have to go through HECS-Science before they go to EC-SRM (this will rather be, I think, for HECS Exec to decide), but HECS-Science could discuss whether a specific item or issue should be brought to EC-SRM and make recommendations in that regard.

Subject: Fw: For approval: URGENT MEDIA REQUEST - Salvia (CTV News Halifax)

For your review. Effects of salvia come straight from the IYH. I also added a few sentences that we used in the last media request to clarify when salvia is considered an NHP.

Stephanie

#### **1 - Has salvia been on Health Canada's radar and why?**

A1 - Health Canada is aware of salvia and has noted media interest regarding the availability of *Salvia divinorum* in Canada.

Health Canada will continue to collect and study information about *S. divinorum* as it becomes available and is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

#### **2 - What are the effects of salvia?**

A2 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness

- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**3 - Is it legal or illegal to sell salvia in Canada? Does this include products sold in stores and/or on the internet?**

**4 - If it is legal or has to be authorised, is this product in fact authorised for sale in Canada?**

**5 - If illegal and in stores, are there any restrictions on salvia that are currently being enforced?**

A3/4/5 - When salvia products are sold for the purposes of modifying brain functions (i.e. for their hallucinogenic effects), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorised natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

~~Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.~~

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Not crazy about the line re domestic and international law enforcement agencies etc as we are not doing that per se. Think we shld just cut that out and move straight to the part about assessing for scheduling...

For Q2, text is accurate but doesn't really respond to question about effects. There is stuff on effects in IYH we could use.

Hi Jeannine,

Below is an urgent media response for approval by 12:45 at the latest as this is due at 2pm today. These proposed responses were drafted using the salvia media lines (that are in the works) and a previously approved media response from a few weeks ago which was thoroughly discussed between HPFB and HECS.

Thanks in advance and sorry for the short notice,  
Nicole

\*\*\*\*\*

### 1 - Has salvia been on Health Canada's radar and why?

A1 - Health Canada is aware of salvia and has noted media interest regarding the availability of *Salvia divinorum* in Canada.

Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

### 2 - What are the effects of salvia?

A2 - Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

### 3 - Is it legal or illegal to sell salvia in Canada? Does this include products sold in stores and/or on the

internet?

4 - If it is legal or has to be authorised, is this product in fact authorised for sale in Canada?

5 - If illegal and is stores, are there any restrictions on salvia that are currently being enforced?

A3/4/5 - To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorised natural health products containing *S. divinorum* and/or salvinatorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinatorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Date: 2010-11-04 11:02 AM  
Subject: URGENT MEDIA REQUEST - Salvia (CTV News Halifax)

Please see request below on salvia.

**Deadline:** By 2pm today.

Thank you, -- Christelle

\*\*\*\*\*

\*\*\* Previous response used to answer a similar media request dated October 20:

**Q1 - Est-ce illégal ou simplement pas encore autorisé au Canada? (L'article cite la GRC qui dit qu'il ne peut rien faire auprès des acheteurs de salvia aussi longtemps que le gouvernement n'a pas légiféré pour rendre le produit illégal.)**

**Q2 - Est-ce que la vente du salvia est toujours autorisé ou non au Canada?**

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Lack of HC regulation making salvia use difficult to control**

THIS NEXT STORY IS ABOUT SOMETHING CALLED SALVIA. IT'S NOT A DRUG, BUT SOME KIDS ARE USING IT TO GET HIGH AND HEALTH CANADA WANTS IT MAKE IT MORE DIFFICULT TO GET, BUT THE FACT THAT IT'S LEGAL MAKES IT DIFFICULT TO CONTROL. KELLAND SUNDAHL HAS THE STORY.

Reporter: THE TRIPS VARY.

THE GRASS IS THE HAIR OF A MUPPET.

Reporter: THE HIGH DOESN'T LAST LONG, BUT IT CAN PACK A POWERFUL PUNCH. OUT OF BODY EXPERIENCES, UNCONTROLLABLE LAUGHTER, AND MEMORY LOSS.

CRAZY AND INTENSE, LASTS TEN MINUTES OR SOMETHING.

Reporter: JEFF HASN'T TRIED THE DRUG BEFORE BUT KNOWS PEOPLE WHO HAVE.

I HEARD OF PEOPLE NOT HAVING AN EFFECT, AND OTHERS THAT WERE SCARED TO DEATH FROM IT.

Reporter: IT CAN BE SOLD AS A NATURAL HEALTH PRODUCT BUT MUST BE AUTHORIZED BY HEALTH CANADA, BUT IF YOU ASK POLICE OFFICERS, THEY'LL SAY IT'S NOT LISTED AS A BANNED SUBSTANCE OR DRUG. HEALTH CANADA IS LOOKING AT REGULATING SALVIA BUT UNTIL THAT IT CAN BE FOUND IN SMOKE SHOPS. IT'S SOLD IN SMALL VIALS AND CAN BE SMOKED.

IT'S NOT A PLEASANT HIGH.

Reporter: MARY LANDRY WORKS THROUGH THE IWK CHOICES PROGRAM IN HALIFAX. SHE'S ONLY EVER RUN ACROSS A FEW TEENS WHO TRIED SALVIA.

IF HEALTH CANADA IS FINDING A REASON TO DO WHAT THEY'RE DOING, IT'S PROBABLY FOR A GOOD CAUSE AND PROBABLY SHOULD CONTINUE DOING WHAT THEY'RE DOING TO PROMOTE HEALTH.

HOW DOES IT FEEL?

Reporter: EVEN IF HEALTH CANADA'S STANCE ISN'T ENOUGH TO DETER SOME PEOPLE, THE EXPENSIVE PRICE OF THE HERB MAY BE. KELLAND SUNDAHL, "CTV NEWS," HALIFAX.

Health Risk Assessment of Salvia divinorum as a Health Product 2010-08-25.doc

Salvia divinorum IAS 2006-11-03.doc

At the last CSS-WG meeting we reviewed the deck "Scheduling Substances under the *Controlled Drugs and Substances Act*". On slide 7, I pointed out that "morning glory" was identified as a plant with psychoactive properties but that may be a bit misleading because the psychoactive species are not the common morning glory that people have in their gardens. I promised I would provide details by e-mail.

The psychoactive "morning glory" plant, species name *Turbina corymbosa* (L.) Raf., Convolvulaceae, widely published synonym *Rivea corymbosa* (L.) Hallier f., is better known in the scientific literature by

its Mexican Nahuatl name of "Ololiuqui". Horticulturally it has the English common names "Christmaspops" or "Christmasvine." The seeds were consumed in water traditionally by the Mexican Chinamec, Mazatec, Mixtec and Zapotec peoples as a narcotic hallucinogen for purposes of divination by traditional healers. Hallucinations occur during the somnambulistic stage of intoxication.

The psychoactive properties are due to biosynthesis of ergoline alkaloids by fungi of the order Clavicipitales (related to ergot) that colonize the adaxial (upper) leaf surface and seeds of certain members of the morning glory family, especially *Turbina corymbosa* and *Ipomoea asarifolia*. A closely related fungus is found on *Ipomoea violacea*. The fungus-derived ergoline alkaloids: chanoclavine, lysergic acid-alpha-hydroxyethylamide, lysergic acid amide, and ergonovine, accumulate in the leaves and seeds of the host plant. The fungi are seed-transmitted to the next generation of plants.

The common garden morning glory is *Ipomoea purpurea* (L.) Roth. Additional horticultural species include *I. pes-caprae*, *I. pandurata*, *I. carnea*, *I. cairica*, *I. quamoclit*, *I. tricolor*, *I. hederifolia*, *I. nil*, *I. aquatica*, *Convolvulus tricolor*, *Argyreia nervosa*, and *Merremia tuberosa*. The wild morning glory or bindweed plants that infest our gardens as noxious weeds are *Convolvulus arvensis* L. (small-flowered) and *Calystegia sepium* (L.) R.Br. (greater bindweed).

Markert et al ergoline alkaloids fungi and Convolvulaceae.pdf

## Health Risk Assessment of *Salvia divinorum* as a Health Product

Marketed Health Products Directorate and Natural Health Products Directorate

revised August 25, 2010

### Issue:

In the last several years, Health Canada has become aware of the use of the plant *Salvia divinorum* and its main active ingredient, salvinorin A, as recreational hallucinogens and their promotion on web sites as “legal alternatives” to illicit drugs. In certain areas of Mexico but not in Canada, this plant has been used traditionally for religious as well as for health purposes.

### Purpose:

This health risk assessment was undertaken to determine the potential risks to health from the use of *Salvia divinorum* and salvinorin A as health products and to help guide potential compliance and enforcement actions to be taken by Health Canada on products available on the Canadian market that contain *Salvia divinorum* or its active constituents.

### Introduction:

*Salvia divinorum* Epling & Játiva is a herb in the mint family (Lamiaceae), native to Mexico. It is also known by a number of common names such as Diviner's Sage, Magic Sage, Mexican Sage, Sage of the Seers, and Herba Maria (Natural Medicines Comprehensive Database 2007). The plant has been used in traditional healing and spiritual practices by the Mazatec Indians of Oaxaca, Mexico (Diaz, 1976).

Salvinorin A (Figure 1), the main hallucinogenic ingredient in *Salvia divinorum*, is a non-nitrogenous neoclerodane diterpene acting as a high-affinity and selective  $\kappa$ -opioid receptor agonist (Chavkin et al. 2004).

Figure 1. Salvinorin A

## **Regulatory Context:**

### **Uses:**

Health Canada has received four reports of adverse reactions involving psychotropic effects, associated with the use of *Salvia divinorum*. There have been several reports (scientific articles, case reports, media enquiries/articles) which indicate that *Salvia divinorum* has the potential for abuse, and is being used by adolescents and young adults for its hallucinogenic properties. In addition, *Salvia* is being widely touted on internet sites aimed at these population groups, as a “legal” alternative to street drugs.

In Canada, neither the herb *Salvia divinorum*, nor its active constituents such as salvinin A, are listed in any Schedule to the *Controlled Drugs and Substances Act* (CDSA), nor any Schedule of the *Food and Drugs Act and Regulations*. *Salvia divinorum* meets the definition of a natural health product (NHP) if marketed in Canada with health claims. However, the current use and advertising of *Salvia divinorum* as a recreational hallucinogen does not meet the intent of the functional component of the definition of a natural health product. In addition, as a hallucinogen and potential drug of abuse, Health Canada’s Office of Controlled Substances (OCS) has placed *Salvia divinorum* on its list of substances to monitor. As part of this action, the OCS will collect relevant information specific to this herb and its active constituents, in relation to its psychotropic use.

Since *Salvia divinorum* in some circumstances meets the definition of a NHP and is not listed in any Schedule to the CDSA, nor any Schedule of the *Food and Drugs Act* or its Regulations, it is appropriate to assess the health risk associated with the use of *Salvia divinorum*, when used as a health product.

### **Traditional Use:**

#### Non-Psychoactive Use:

When consumed orally, *Salvia divinorum* has been used traditionally to treat diarrhoea, constipation, anaemia, headache, rheumatism and alcohol addiction, as well as for regulation of urination. It is also used topically in traditional settings for treating ulcers of the skin (Natural Medicines Comprehensive Database, 2007; Valdes et al., 1982).

#### Psychoactive Use:

*Salvia divinorum* has been used traditionally by the Mazatec people of Oaxaca, Mexico, for religious ceremonies, in order to produce “mystical” and hallucinogenic experiences. The psychoactive effects can be produced by chewing the leaves, or by inhalation of the smoke from the leaves.

## **Non-Traditional Use:**

### Non-Psychoactive Use:

No information is available on *Salvia divinorum*-containing products currently marketed for health-related purposes. Some research, however, suggests therapeutic potential for salvinorin A (see Therapeutic Potential section, below).

### Psychoactive Use:

The main non-traditional use of *Salvia divinorum* relates to its psychoactive properties and use as a street drug. The hallucinogenic properties can be achieved by a variety of means, and products available commercially for such purposes include dried leaves, extracts, plant cuttings, tinctures, tablets, essence and leaf juice. Products can be taken orally (tablets, leaves extract), sublingually (tincture) and by inhalation (smoking of dried leaves, extract), to experience hallucinogenic effects.

## **Hazard Assessment and Characterisation:**

### Pharmacokinetics:

The main active constituent of *Salvia divinorum*, both from the perspective of psychoactive and potential therapeutic use, appears to be the diterpene salvinorin A.

The pharmacokinetics of salvinorin A have not been studied extensively; however, it is apparent that when taken orally, the hallucinogenic effects depend on absorption by the oral mucosa, as salvinorin A is largely inactivated in the gastrointestinal tract (Siebert, 1994). Although some psychotropic activity has been noted after drinking the leaf juice, the effects are much more mild compared to the chewing of the leaves (Siebert, 1994). Siebert (1994) administered 2 mg of encapsulated salvinorin A to human subjects. Swallowing the capsules produced no detectable psychotropic activity. Thus, the most effective way (orally) to use the plant or its purified constituents to achieve hallucinogenic effects is to ensure the salvinorin A remains in the mouth for a period of time, allowing buccal absorption. Other studies on the pharmacokinetics and potential therapeutic effects of salvinorin A have relied on non-oral routes of exposure (Schmidt et al., 2005; McCurdy et al., 2006).

It should be noted that since salvinorin A is postulated as the phytochemical in *Salvia divinorum* that has potential therapeutic effect, the plant and its extracts may only be effective when administered non-orally. More research is required to clarify the potential therapeutic uses of *Salvia divinorum*. More detail is provided below.

### Toxicology studies on *Salvia divinorum* and salvinorin A:

No studies appear to have been performed to determine the adverse effects of *Salvia divinorum*, or its chemical constituents, in humans.

With regard to animal toxicity studies, only one published report is available. Mowry et al. (2003) examined the short term effects of salvinorin A in rats. Swiss-Webster rats of both sexes, 4-6 months of age, were administered salvinorin A by intraperitoneal injection at doses of 0 (vehicle control), 400, 800, 1600, 3200 and 6400 ug/kg/day for 14 days. A total of 114 animals were used, specific numbers in each group were not reported. The authors did not observe any effects on cardiac conduction (PR or QT intervals), heart rate, body temperature or galvanic skin response. In a separate study, a nonsignificant rise in pulse pressure was observed after 20 and 40 minutes of salvinorin A exposure in anesthetized rats administered a single dose of 1600 ug/kg. In the repeat-dose study, no histologic differences were noted at any salvinorin A doses for either sex in the liver, spleen, kidney, bone marrow or brain tissue. The authors concluded that while salvinorin A is a potent hallucinogen, it has relatively low toxicity.

Mowry et al. (2003) also noted a literature report of a single dose of 1g/kg bw of an extract of *Salvia divinorum*, injected in mice (specific route unknown), where no toxic effects were noted. The actual reference provided by Mowry et al. for this study (Valdes et al., 1984), does not make mention of the actual dose, route of administration, or animal species employed, but notes that this administration produced behavioural patterns resembling the intoxication in humans.

Longer terms studies on the potential toxic effects of salvinorin A, or the whole plant, are not available, and no specialized studies (eg. teratology studies) appear to have been published in the scientific literature to date.

#### Psychotropic effects and mechanism of action:

The psychotropic effects induced by salvinorin A include altered perception, hallucinations, ataxia, depersonalization, hysterical laughter, incoherent speech and unconsciousness (Siebert DJ, 1994). Onset and intensity of the effects of salvinorin A depend on the dose and route of administration. A route that avoids the hepatic first-pass effect (sublingual, inhalation) produces rapid and intense effects.

The effects of *Salvia divinorum* can last up to two hours after absorption through the oral mucosa, while effects of inhaled salvia can last up to 30 minutes. A minimum dose of 200-500 µg of purified salvinorin A, or 0.1 - 0.5 g of dried leaves of *Salvia divinorum* were shown to produce intense psychoactive affects when inhaled (Bucheler et al., 2005).

Various studies have claimed that the psychotropic effects of *Salvia divinorum* closely resemble the symptoms of schizophrenia induced by other drugs such as LSD, phencyclidine or ketamine (Hansen et al., 1988; Javitt and Zukin, 1991; Valdes, 1994).

Salvinorin A has been shown to be a potent agonist of the kappa-opioid receptor (Chavkin et al., 2004). Research has shown that the hallucinogenic effects of salvinorin A are mediated through its kappa-opioid receptor agonist activity (Zhang et al, 2005).

Salvinorin A is structurally different from other naturally occurring classical hallucinogens such as mescaline, psilocybin and lysergic acid diethylamide. Typical doses of other hallucinogens (LSD, mescaline and psilocybin) required to produce hallucinogenic effects are 50-250 ug, 100

mg and 5 mg, respectively (Wolowich et al., 2006), while a minimum dose of 200-500 µg of purified salvinorin A can produce intense psychoactive affects, when vapourised and inhaled (Natural Medicines Comprehensive Database, 2007). Therefore, salvinorin A has more potency compared to mescaline and psilocybin, both of which are controlled substances in Canada. The Natural Medicines Comprehensive Database (2007) notes that “salvinorin A is the most potent hallucinogen known.”

Adverse reactions associated with the use of *Salvia divinorum*:

Domestic reports: See the appendix for detailed causality assessments of the adverse reaction reports submitted to Health Canada. Health Canada has received four reports of adverse reactions (ARs) associated with the use of *Salvia divinorum*. All of these ARs involved psychotropic effects. Out of the four AR reports, three cases involving inhalation were associated with hallucinogenic effects and were considered to be non-serious reactions. The fourth case, however, was considered serious and was associated with the oral use of the chemical constituent salvinorin A. As well, it should be noted that, in this case report, salvinorin A was consumed in a therapeutic drug form (one tablet containing 57 mg of salvinorin A), although this commercially available product was meant to provide psychotropic, rather than therapeutic, effects. In this particular case, the product produced the effects when combined with alcohol.

Summary of Canadian domestic AR cases associated with *Salvia divinorum* or salvinorin A

Total number of cases	4
Route of exposure	Oral (1) & Inhalation (3)
Age range	16 yrs - 56 yrs
Gender	2 male, 2 female
Causality	oral - 1 possible; inhalation - 2 possible, 1 probable

International reports: Two case reports of salvia abuse have been published in the scientific literature.

- (1) An international case report involving *Salvia divinorum* was published in which a young man (19 years of age) described his perceptions after inhaling the smoke from *Salvia divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves (Bucheler et al., 2005).
- (2) Most recently, another published case of *Salvia divinorum* abuse involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved

significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of Salvia use (Singh, 2007). However, given that this is the only case report in which déjà vu was associated with the use of *Salvia divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case report was reported in the US in which a 17-year-old boy committed suicide after smoking *Salvia divinorum* for unknown period of time (<http://www.kvbc.com/Global/story.asp?S=4893692>). Alcohol and general depression were the main confounders in this case. As a result of this case, however, the state of Delaware passed a law outlawing *Salvia divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances (<http://www.jointogether.org/news/headlines/inthenews/2006/youths-death-inspires.html>). It should be noted that suicidal symptoms were also observed in one of the four domestic cases of *Salvia divinorum* abuse reported to Health Canada.

#### Dose-response assessment

The dose-response for non-psychoactive adverse effects of *Salvia divinorum* or salvinorin A, by any route of administration, either in animals or humans, is unknown. No statistically significant findings were noted in the only available study (Mowry et al., 2003), in which NOELs of 1600 ug/kg bw and 6400 ug/kg bw/day were noted for acute physiologic effects, and short-term histological effects, respectively, using intraperitoneal injection. No longer term studies are available.

The intensity of the psychotropic effects in humans, induced by *Salvia divinorum*, has been noted as dose-dependent; however, a quantitative dose-response assessment has not been carried out. It is known, however, that the minimum dose required to produce hallucinogenic effects by inhalation is about 200 ug salvinorin A (Bucheler et al., 2005).

#### Potential for Dependence, Addiction, and Abuse

It is well known that *Salvia divinorum* or purified salvinorin A can produce various psychotropic effects (altered perception, hallucinations, ataxia, hysterical laughter, and incoherent speech) in humans. As noted above, the intensity of the psychological effects induced by salvinorin A is dose-dependent: high doses can produce extreme effects, such as depersonalisation with loss of reality, and intense psychosis which could be enough for users to harm themselves or others unintentionally (Siebert, 1994). In addition, the symptoms associated with *Salvia divinorum* are expected to be similar to those seen with other hallucinogens, although the duration of effects can be much shorter, depending on the route of exposure (inhalation vs. buccal absorption).

Drug dependence is a physiologic state where continued administration of the drug is necessary to prevent withdrawal; it can be of two types, physical and/or psychological. Dependence can be

influenced by certain receptor types, such as opioid receptors. The existence of three major groups of opioid receptors (mu, delta and kappa) in the central nervous system is well documented (Suzuki and Misawa 1997). There exist complicated interactions among opioid receptor types. The activation of the kappa opioid receptor suppresses physical and psychological dependence produced by mu and delta opioid receptor agonists, but the activation of the delta opioid receptor potentiates the dependence of mu opioid receptor agonists. Various studies provide arguments to support substantial roles for mu-opioid receptors and the possible involvement of delta-opioid receptors in the development of physical and psychological dependence produced by morphine (Narita et al. 2001; Suzuki and Misawa 1997). Most of the drugs used clinically that are mu-opioid analgesics are habit-forming. While both receptor types (delta and mu) provide analgesia, only stimulation of the mu-opioid receptors lead to tolerance and dependency. Opioid agonists (stimulators) such as morphine and other drugs (meperidine, diphenoxylate, methadone, dextromethorpan, codeine, fentanyl, heroin, and tetrahydrocannabinol) exert their activity mainly at the mu receptor (Gaveriaux-Ruff and Kieffer 2002; Narita et al. 2001; Pasternak 2003; Suzuki and Misawa 1997). Using in vitro methods, Margolis et al. (2003) demonstrated that the mechanism of action of kappa opioid receptor agonists may involve direct inhibition of midbrain (ventral tegmental area) dopaminergic neurons, that play a critical role in motivation and reinforcement of goal-directed behaviours, and are excited by addictive substances such as morphine. It is well known that mu and delta opioid receptor agonists produce psychological dependence, while kappa opioid receptor agonists produce an aversive effect, i.e. dysphoria rather than euphoria (Kumor et al. 1986; Rothman et al. 2000). The activation of kappa-receptors also leads to the suppression of mu/delta-mediated side effects such as dependence and respiratory depression.

Salvinorin A is unique in that it is a potent, non-nitrogenous, selective kappa opioid agonist, distinct in its actions from other known opioid receptor agonists. It appears to be devoid of the mainly mu receptor-mediated side effects such as dependence and respiratory depression associated with morphine and its analogues. It may, thus, be possible to use salvinorin A to treat heroin, cocaine, alcohol and amphetamine dependency, depressive illness, and even excessive marijuana use. Being defined by its selectivity for the kappa class of opioid receptor, salvinorin A has the potential to offer a non-habit forming alternative to addictive drugs. It may also reduce the effects of physical and emotional dependence by its antidepressive action (Hanes, 2001).

Although *Salvia divinorum* does not appear to cause dependency, it has the potential for abuse/misuse, especially by young adults. Health Canada has received four domestic case reports of adverse reactions (ARs) associated with the use of *Salvia divinorum* (three inhaled and one oral). In addition, Health Canada is aware of several media reports published on the issue of *Salvia divinorum*, specifically its presence on the market as a legal alternative to illicit drugs. This has prompted the concern of police (eg. Saskatoon Star-Phoenix, December 21, 2006). Furthermore, there are two international cases of salvia abuse published in scientific journals. However, it is important to note that accumulated case reports cannot be used to determine the incidence of a reaction, nor the risk associated with use of a product, because of the unknown number of individuals exposed to the product and because of the significant under-reporting of ARs. In any case, it should be noted that the Canadian Adverse Drug Reaction Monitoring

Program is not an appropriate tool to obtain information concerning adverse reactions associated with the use of *Salvia divinorum* as a street drug.

It has been suggested that *Salvia divinorum* is the most marketed herbal substances available for use as a legal alternative to illicit drugs of abuse, among adolescents and young adults (Siemann et al., 2006; Dennehy et al., 2005). In 2000, a large number of *Salvia divinorum* plants were seized at a large scale plantation in Switzerland, which suggest that its use is increasing as a recreational drug in Europe (Giroud et al, 2000). Several countries (Australia, Denmark, Finland, Italy, Norway, Sweden and some states of the US) have either banned or included *Salvia divinorum* in their list of *controlled substances*.

The above evidence would suggest that any therapeutic products containing *Salvia divinorum* and/or salvinorin A could be misused or abused for their potential psychotropic activities.

### **Therapeutic potential of *Salvia divinorum* and salvinorin A**

Recent studies have suggested that salvinorin A acts at kappa opioid receptor sites (Chavkin et al. 2004; Valdes 1994; Roth et al. 2002). Selective kappa receptor agonists have been shown to produce analgesic effects with potential for reduced tolerance and dependence (Tidgewell et al., 2004). Animal studies have shown that salvinorin A has short-acting anti-nociceptive effects which operate via kappa opioid receptors (McCurdy et al., 2006). Considering the functional interaction between opioid receptor types noted above, the co-administration of morphine-like compounds with kappa-receptor agonists, such as salvinorin A, may constitute a preferable and superior approach to the treatment of pain with fewer side effects (Narita et al., 2001).

There have been significant advances in studies on the role of kappa opioid receptor agonists in producing aversive effects and in the potential modulation of withdrawal from other substances such as morphine, cocaine, THC, alcohol, and in other non-opioid addictions (Cui et al. 2000; Hahn et al. 2000; Mori et al. 2002; Raffa et al. 2003; Rosin et al. 1999; Rothman et al. 2000; Schenk et al. 1999; Tao et al. 1994). As noted above, it may, thus, be possible to use salvinorin A to treat heroin, cocaine, alcohol and amphetamine dependency, clinical depression, and even excessive marijuana use. Because of its selectivity for the kappa class of opioid receptor, salvinorin A has the potential to offer a non-habit forming alternative to these drugs, and may also reduce the effects of physical and emotional dependence by its antidepressive action (Hanes, 2001). Nevertheless, salvinorin A is a well recognised hallucinogen in its own right.

One study suggests that the salvinorin A may be used as a novel molecular candidate for the development of antipsychotic drugs and could be used to treat psychiatric (schizophrenia, bipolar depression) and neuropsychiatric disorders (Alzheimer's disease, dementia) (Sheffler and Roth, 2003).

It should be noted that the above-mentioned therapeutic potentials of *Salvia divinorum* are extrapolated from the results of preliminary investigations, and therefore, much more evidence is needed to substantiate the therapeutic use of *Salvia divinorum* or salvinorin A.

### **Exposure Assessment:**

It is not feasible to assess the exposure to *Salvia divinorum* or salvinorin A from the use of health products, as such products do not appear to exist in Canada, currently. Based on currently available information, however, it is possible that any therapeutic doses of this plant or its active constituents may produce adverse psychoactive effects (see below).

### **Risk Characterization:**

Although little scientific information exists regarding dose-response for *Salvia divinorum* or salvinorin A, risks associated with their use can be assessed in a qualitative manner.

The single toxicological study in animals alludes to the low toxicity of salvinorin A, at least with respect to certain physiological and histological effects. No information, however, is available on the potential long-term effects of exposure to *Salvia divinorum* or salvinorin A, and no studies have looked at the potential for other effects such as teratogenicity.

The psychotropic, and potentially therapeutic effects, elicited by salvinorin A are dependant on the route of exposure. Inhalation and buccal absorption are the most efficient; however, the bioavailability is greatly reduced when ingested without prolonged contact with the oral mucosa.

It is unknown if any potentially therapeutic effects of *Salvia divinorum* /salvinorin A would be achieved via inhalation or ingestion. Although the psychotropic effects appear to be dose-dependent, without more information on the dose-response of the hallucinogenic or therapeutic effects of *Salvia divinorum* or salvinorin A, the risk cannot be fully characterized. However, since the hallucinogenic and potentially therapeutic effects are both dependant on salvinorin A's affinity for the kappa opioid receptor, it is possible that any exposure to the plant or its active constituents, at a dose required for therapeutic use, may result in some degree of psychoactivity. Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use (Barker et al. 2002; Tidgewell et al., 2004). Thus, the potential for psychoactivity, and therefore abuse, with any future therapeutic use of *Salvia divinorum* or salvinorin A, cannot be discounted at the present time.

### **Summary and Conclusions:**

Salvinorin A appears to have low acute and short-term toxicity, although only one limited toxicological study in animals was identified in the scientific literature. No long-term studies have been published, and the long-term safety of this compound has not yet been established. The scientific literature does not support the possibility of developing dependency with *Salvia divinorum* use; however, its use has the potential for misuse or abuse. *Salvia divinorum* and salvinorin A have the ability to induce dose-dependent, moderate to severe hallucinogenic effects in humans, depending on the route of administration.

The fact that a clear dose-response has not been established for the potential therapeutic benefits of salvinorin A, and that the psychotropic and potentially therapeutic actions rely on the same mechanism of action, suggest that any therapeutic activity established in the future may also produce unwanted psychotropic effects. Therefore, the psychotropic activity of *Salvia divinorum* and salvinorin A may lead to the abuse of any health products proposed in the future.

In addition to the above, one of the potential therapeutic uses of salvinorin A is in the treatment of addiction to illicit drugs such as cocaine and heroin. Such potential use should be carried out under the supervision of a qualified physician.

#### Recommendations:

Based on the above assessment, *Salvia divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk, defined as "A situation in which there is a reasonable probability that the use of, or exposure to, a product, will cause moderate or mild adverse health consequences."

Health products containing *Salvia divinorum* or salvinorin A would meet criteria A (requirement for direct practitioner supervision), C (potential or known undesirable or severe side effects at normal therapeutic doses), and H (possess a dependence or abuse potential that is likely to lead to harmful non-medicinal use) of Schedule F of the *Food and Drug Regulations*. Thus, it is recommended that if such therapeutic products were identified, they should be classified as Schedule F products, precluding them from being Natural Health Products, or regulated under *the Natural Health Products Regulations*.

APPENDIX  
CAUSALITY ASSESSMENTS OF ADVERSE REACTIONS

Updated May 22, 2007

FINAL

Natural Health Product: *Salvia divinorum*

Purpose of the assessment:

To review the adverse reactions<sup>1</sup> associated with the use of *Salvia divinorum*. (Domestic case reports are reviewed with respect to causality<sup>2</sup> and seriousness<sup>3</sup>)

Date of review commenced:  
May 2005 - ongoing monitoring

Medical evaluator(s):  
Dr. T. Desjarlais-Renaud

Approved:  
Dr. M. Murty (Sept. 9/05; revised May 22, 2007)

#### Search Strategy:

Adverse reactions suspected to be associated with *Salvia divinorum* were searched, using the search term *Salvia divinorum* in the Canadian Adverse Drug Reaction Monitoring Program (includes reports received and entered into the database from January 01, 1997 to May 3, 2005)]

#### Executive summary:

There are 4 domestic Canadian case reports of neuropsychiatric adverse effects associated with the use of *Salvia divinorum* (3 “non-serious” cases associated with inhalation route of administration and 1 “serious” case associated with oral ingestion).

The ‘serious’ case of psychosis associated with oral use was confounded by concomitant alcohol and therefore, the causality assignment is “Possible”.

One of the inhaled cases was assessed as ‘probable’ but the reaction was not ‘serious’.

**Conclusion:** In the serious case, *Salvia* was sold in a drug form, a tablet containing 57 or 72 mg of Salvinorin-A. In this case concomitant use of *Salvia* and alcohol most likely contributed to the adverse reaction of psychosis.

---

<sup>1</sup> Natural Health Product Regulations: <http://canadagazette.gc.ca/partII/2003/20030618/html/sor196-e.html>

An **adverse reaction** is defined as a noxious and unintended response to a natural health product that occurs at any dose used or tested for the diagnosis, treatment or prevention of a disease or for modifying an organic function.  
(*réaction indésirable*)

<sup>2</sup> Based on the WHO causality algorithm unless otherwise specified. (See appendix for WHO algorithm)

<sup>3</sup> Natural Health Product Regulations: <http://canadagazette.gc.ca/partII/2003/20030618/html/sor196-e.html>

A **serious adverse reaction** means a noxious and unintended response to a natural health product that occurs at any dose and that requires in-patient hospitalization or a prolongation of existing hospitalization, that causes congenital malformation, that results in persistent or significant disability or incapacity, that is life threatening or that results in death. (*réaction indésirable grave*):

In the 3 non serious cases, there was disorientation and hallucination after taking one "puff" of Salvia divinorum.

From a clinical perspective, the main concern is the easy access, availability in retail outlets to adolescents without controls and the potential for misuse, as suggested by the AR case report of prolonged psychosis in an adolescent. Additionally, the hallucinogenic effects of Salvia may put individuals in life-threatening situations for themselves and others (driving while under the influence of Salvia). Although the case was confounded by alcohol and details of "intervention" were not specified in the report, it is likely that the Salvia component had contributed significantly to the psychosis, requiring restraint, observation/monitoring prior to the incarceration. Psychosis is a medically significant event and causality remains "Possible" and "Serious".

It is important to note that CADRMP is not the proper tool for monitoring the risk associated with Salvia in this context, because CADRMP is not designed or promoted for the collection of street drug effects. Rather, CADRMP is designed and promoted for the collection of adverse reactions associated with health products, and Salvia used in the current context would not be considered a health product.

Further monitoring and public education are necessary to regulate and possibly restrict Salvia divinorum.

Total domestic AR case reports associated with the use of Salvia divinorum up to May 31, 2005

Source of ADRs	# of cases report	route		psychosis	hallucination disorientation	Causality certain	Causality probable	Causality possible	Serious	Fatal outcome

Summary of Causality Assessment of reaction associated with the use of *Salvia divinorum*

Case ID	Age/gender	Date/Adverse reaction (AR)	Suspect drug/Product name	Route/Dose/Freq.	Time to onset AR/Exposure time period	Possible Confounders	Outcome	Causality	Serious (Y/N)
177866 consumer Jan 12, 2005	27yr/ F	-Unknown - Disorientation, hallucination, not recognizing people around her.	<i>Salvia divinorum</i> Puff encens spécial	Inhalation	1 puff taken	No	Recovered (Effect lasted 5 minutes)	Probable	No

Case summary no 0177866

A 27 year old woman experienced disorientation, not recognizing people in the room, hallucination for a duration of approximately 5 minutes after taking one puff of *Salvia divinorum*. The product called *Puff encens spécial* obtained from a boutique called "L'Ecologique" was inhaled thru a pipe. Patient reported prior use of mescaline and LSD and that the effect of those were not as bad ("moins pires"). The patient was on no other medications. This is not an unexpected reaction to *Salvia divinorum*.

There is no evidence from the case report that she had recently taken other hallucinogenic substances.

The causality was assigned as probable.

The adverse reaction judged as not serious.

Case ID reporter date received	Age/ gender	Date/ Adverse reaction (AR)	Suspect drug/ Product name	Route/ Dose/ Freq.	Time to onset AR/ Exposure time period	Possible Confou nders	Outco me	Caus ality	Seri ous (Y/ N)

Case summary no 0177865

A 28 year old man experienced disorientation, foaming at the mouth, hallucination for a duration of approximately 5 minutes after taking one puff of *Salvia divinorum*. The product called *Puff encens spécial* obtained from a boutique called "L'Ecologique" was inhaled thru a pipe. There was no concomitant medication. Past medical history is unknown. This is not an unexpected reaction to *Salvia divinorum*.

The causality was assigned as possible.  
The adverse reaction judged as not serious.

Case ID reporter date received	Age/ gender	Date/ Adverse reaction (AR)	Suspect drug/ Product name	Route/ Dose/ Freq.	Time to onset AR/ Exposure time period	Possible Confou nders	Outco me	Caus ality	Seri ous (Y/ N)

179969  consumer  Feb. 17, 2005	56yr/F	-Unknown - Disorientation, hallucination, does not recognize husband	<i>Salvia divinorum</i> Al sasia encens special	Inhalation	1 puff taken	Unknown	Recovered (total effect 30 minutes)	Possible	No

Case summary no 0179969

A 56 year old woman experienced 30 minutes of disorientation and vivid hallucination after taking 1 puff of *Salvia divinorum*. The reaction was very intense for 10 minutes and then decreased in intensity. The past medical history, concomitant medication and NHP usage are unknown. This is not an unexpected reaction to *Salvia divinorum*.

The causality was assigned as possible.  
The adverse reaction judged as not serious.

Case ID reporter date received	Age/ gender/ weight	Date/ Adverse reaction (AR)	Suspect drug/ Product name	Route/ Dose/ Freq.	Time to onset AR/ Exposure time period	Possible Confounders	Outcome	Causality	Serious (Y/ N)

0185128  Consumer (parent)  May 31, 2005	16yr/M  150 lbs	March 29, 2005/ -drug induced psychosis -incoherent -suicidal - restrained -threatened to kill police officers -amnesia (does not remember any of these events) -jailed	Salvia/ aka Maria Pastora	oral/ 1 tablet "the 30\$ pill" 57mg *	single dose	Yes  <u>Concomitant intake of:</u> Alcohol ("few drinks")  <u>Concomitant condition:</u> ADD	Recovered	Possible	Yes

Case summary no 0185128:

On March 23, 2005, a 16 year old male experienced drug induced psychosis: was incoherent, was suicidal, needed to be restrained, threatened to kill police officers, was jailed and had amnesia of these events after taking a single tablet of *Salvia* ( aka Maria Pastra). He had also consumed a few drinks of alcohol. He had an underlying Attention Deficit Disorder (ADD) but was not receiving medication for this. He had previously taken *Salvia* "on its own" (route of administration unknown) with no adverse reaction.

Additional information obtained through the ADR specialist:

\* Follow up request for more information obtained July 28 2005, confirmed that the tablet was oral "30 \$ pill" purchased "behind the counter" at Bob Headquarters<sup>4</sup> in Manitoba. This outlet

<sup>4</sup><http://www.bobhq.com/public/index.htm>

sells a Salvia 10x containing 57 mg of Salvinorin-A for 29.98\$ and a Salvia 20x containing 72 mg of Salvinorin-A for 39.98\$.

Further information received August 18 2005: When Salvia was taken previously, it was the same dose (30\$ pill orally). The only thing different was that on previous occasions, the patient did not have alcohol with it.

This is a case where there was no adverse reaction with previous use of *Salvia* (same dosage, same distributor, same route of administration) but when associated with alcohol, it had a severe adverse reaction.

The causality was assigned as possible with alcohol as a confounder.

The adverse reaction was judged as serious because it required intervention.

## Appendix

### WHO algorithm of Causality Categories:

1	Probably/Likely:	a clinical event, including laboratory test abnormality, with a reasonable time sequence to administration of the drug, unlikely to be attributed to concurrent disease or other drugs or chemicals, and which follows a clinically reasonable response on withdrawal (dechallenge). Rechallenge information is not required to fulfil this definition.
2	Possible:	a clinical event, including laboratory test abnormality, with a reasonable time sequence to administrations of the drug, but which could also be explained by concurrent disease or other drugs or chemicals. Information on drug withdrawal may be lacking or unclear.
3	Unlikely	A clinical event, including laboratory test abnormality, with a temporal relationship to drug administration which makes a causal relationship improbable, and in which other drugs, chemicals or underlying disease provide plausible explanations.
4	Conditional/Unclassified	A clinical event, including laboratory test abnormality, reported as an adverse reaction, about which more data are essential for a proper assessment or the additional data are under examination.
5	Unassessable/Unclassifiable	A report suggesting an adverse reaction which cannot be judged because information is insufficient or contradictory, and which cannot be supplemented or verified.

## **NHPD AND MHPD ISSUE ANALYSIS SUMMARY**

### ***Salvia divinorum* Regulatory Authority and Health Risks**

**Prepared by:** Jacinta Roberts and Robin Marles, NHPD, and Shahid Perwaiz, MHPD

**Draft Date:** June 24, 2004

**Draft Revised:** July 15, 2004

**Finalized:** July 15, 2004

**Updated:** November 3, 2006

#### **ISSUES**

1. Which regulatory authority is most appropriate for *Salvia divinorum* under various conditions of use?
2. What are the risks to consumers of this substance?

#### **BACKGROUND AND ISSUE ANALYSIS**

##### ***Salvia divinorum* as a Health Product**

*Salvia divinorum* Epling & Játiva is an herb in the mint family (Lamiaceae), native to Mexico, that is smoked as a hallucinogen. As a substance it falls under Item 1 of Schedule 1 (inclusion list) to the *Natural Health Products Regulations*, which includes: "a plant or plant material, an alga, a bacterium, a fungus or a non-human animal material."

The main active ingredient of *Salvia divinorum* is a neoclerodane diterpene compound called salvinorin A, which currently falls under Schedule 1, item 2: "an extract or isolate of a substance described in item 1, the primary molecular structure of which is identical to that which it had prior to its extraction or isolation."

In Canada neither the herb, *Salvia divinorum*, nor its active ingredients, such as salvinorin A, are listed in any Schedule to the *Controlled Drugs and Substances Act* (CDSA), nor any Schedule of the *Food and Drugs Act* or its Regulations that would remove it from the purview of the *Natural Health Products Regulations*.

*Salvia divinorum* and its active constituents therefore meet the substance aspect of the regulatory definition of a natural health product.

Whether or not *Salvia divinorum* products meet the function aspect of the regulatory definition of a natural health product depends on the purpose for which the product is being manufactured, sold, or represented for use. According to Section 1(1) of the *Natural Health Products Regulations*, a natural health product means a substance that is manufactured, sold, or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

*Salvia divinorum* has traditional medicinal uses among the native peoples of Mexico, e.g. for the treatment of topical ulcers (Díaz 1976), to help normalize eliminatory functions (diarrhoea/ constipation and urination), anemia, headaches, rheumatism, and alcohol addiction, in addition to its use as a hallucinogen in divination rituals (Valdés et al. 1982).

With respect to potential modern uses, there is one human case study from Australia suggesting a possible antidepressant effect (Hanes 2001).

Since *Salvia divinorum* and salvinin A under some conditions of use meet both the functional and substance portions of the definition of a natural health product and are not currently subject to any regulatory exclusions, if associated with a health claim finished products containing these substances could be considered to be natural health products (NHPs).

Until such time as the herb and its active constituent are scheduled under the CDSA or Schedule F to the *Food and Drug Regulations*, the NHPD has jurisdiction to receive a Product Licence Application for a therapeutic use. However, the safety assessment will be sufficiently rigorous to protect consumers' health, particularly with respect to the following safety factors:

- “Does the medicinal ingredient or product have a demonstrated potential for addiction, abuse or severe dependency that is likely to lead to harmful non-medicinal use?”
- “Does the medicinal ingredient or product have known adverse effects at the recommended or therapeutic dosage level?”
- “Does the medicinal ingredient or product have a therapeutic effect based on recently established pharmacological concepts, the consequences of which have not yet been fully established?”
- “Does the medicinal ingredient or product possess a high level of risk relative to expected benefits?”

The answers to these questions are as follows:

- Despite the fact that it is being used as a hallucinogen, the potential for *Salvia divinorum* to cause addiction or dependence is likely to be very low since it affects the brain in way that is quite different from other hallucinogens such as heroin or LSD.
- Nevertheless, *Salvia divinorum* alters perception and could potentially trigger withdrawal symptoms in people suffering from other addictions.
- It is subject to abuse as a street drug.
- It acts on the brain in a way that is quite novel and for which the consequences have not yet been fully established.

For all those reasons, the risks of *Salvia divinorum* use compared to any expected benefits suggest that if it were to be regulated as a health product, it should require a prescription under the *Food and Drug Regulations*, rather than being regulated as an over-the-counter natural health product.

### ***Salvia divinorum as a Hallucinogen***

As with many other NHP substances, there are other uses for the herb that may in future be more appropriately regulated under a different framework.

*Salvia divinorum* is used as a hallucinogen in traditional divination rituals (Valdés et al. 1982) and is being widely touted on internet sites aimed at young adults and adolescents as a "legal" alternative street drug.

The current use and advertising of *Salvia divinorum* as a recreational hallucinogen does not meet the intent of the function component of the *Natural Health Products Regulations*' definition of a natural health product. Nevertheless, even if it is being sold without labelled claims as leaf material in a plastic baggy, it is being represented for use in "modifying organic functions in humans" so from a compliance perspective *Salvia divinorum* falls under the jurisdiction of the *Food and Drugs Act*.

As a hallucinogen and drug of abuse, Health Canada's Office of Controlled Substances has placed *Salvia divinorum* on its list of substances to monitor. As part of this action, the Office of Controlled Substances will collect relevant information specific to this herb and its active constituents.

### ***Salvia divinorum in Other Regulatory Jurisdictions***

In the U.S. Congress, *Salvia divinorum* was the subject of a bill (H.R.5607) entitled "To amend the Controlled Substances Act to place Salvinorin A in Schedule I" introduced on October 10, 2002, seeking to place the herb and its active constituent salvinorin A onto U.S. Controlled Substances Act Schedule 1 (drugs or other substances with a high potential for abuse, with no currently accepted medical use in treatment in the United States, and with respect to which there is a lack of accepted safety for use under medical supervision). Since November 11, 2002, the bill has been referred to the Subcommittee on Crime, Terrorism, and Homeland Security (<http://thomas.loc.gov/cgi-bin/bdquery/z?d107:HR05607:@@L&summ2=m&>, accessed June 24, 2004). Currently, the FDA considers street drug alternatives such as *Salvia divinorum* to be unapproved new drugs and misbranded drugs under sections 505 and 502 of the Act (<http://www.fda.gov/cder/guidance/3602fnl.pdf>, accessed May 26, 2004) and has issued warning letters to a number of firms. Thus it appears that the U.S. has sufficient regulatory authority already to achieve the necessary level of control.

Both the herb and the active ingredient are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety," but no substantiation of this risk was provided (<http://www.tga.health.gov.au/ndpsc/record/rr200111upd8.pdf>, accessed May 26, 2004). They are both also in Category B of the Danish list of controlled substances (<http://www.retsinfo.dk/delfin/html/b2003/0071405.htm>, accessed May 26, 2004).

### ***Scientific Details of the Potential of Salvia divinorum for Abuse***

*Salvia divinorum* is smoked to induce visual hallucinations, the diversity of which are described by its users to be similar to those induced by other hallucinogens such as

mescaline or psilocybin. Since neither *Salvia divinorum* nor any of its active ingredients are specifically listed in the *Controlled Drugs and Substances Act*, nor any Schedule of the *Food and Drugs Act* or its Regulations in Canada, some on-line botanical companies and drug promotional sites have advertised the herb as a legal alternative to other plant hallucinogens like mescaline. The objective of this section is to provide background on whether or not *Salvia divinorum* has the potential to induce dependence effects.

Salvinorin A (there are B and C forms) is a hallucinogen when vaporized and inhaled. Salvinorin A is a highly efficacious *kappa*-opioid receptor agonist of clinical interest for treatment and etiological studies of depression, dementia, bipolar disorder, and schizophrenia (Chavkin et al. 2004, Roth et al. 2002). Chemically, salvinorin A is a psychotropic diterpenoid.

Other plants with similar properties include *Cannabis sativa*, which contains the phenolic active principle, tetrahydrocannabinol (THC), and *Artemisia absinthium*, also known as wormwood and used to make the liqueur asbinthe, which contains the monoterpene active principle, thujone.

A dose of 200 to 500 micrograms of salvinorin A produces profound hallucinations when smoked. Its effects in the open field test in mice and locomotor activity tests in rats are similar to those of mescaline. A large body of evidence links the action of hallucinogenic agents (LSD, mescaline) to effects at serotonin (5-HT) receptor sites in the central nervous system (Aghajanian and Marek 1999). Salvinorin A's actions in the brain are not well elucidated. However, recent tissue testing (in vitro assays) have suggested that salvinorin A acts at the *kappa* opiate receptor site (Chavkin et al. 2004; Valdes 1994; Roth et al. 2002). Effects associated with *kappa* opioid receptor activation include analgesia, sedation, and dysphoria (Barker et al. 2002). Using in vitro methods, Margolis et al. (2003) have found evidence that the mechanism of action of *kappa* opiate receptor agonists may involve direct inhibition of midbrain (ventral tegmental area) dopaminergic neurons that play a critical role in motivation and reinforcement of goal-directed behaviours, and have also been implicated in the addictive process initiated by drugs such as morphine.

Drug dependence is a physiologic state where continued administration of the drug is necessary to prevent withdrawal; it can be of two types, physical and/or psychological dependence. The existence of three major groups of opioid receptors (*mu*, *delta* and *kappa*) in the central nervous system is well documented (Suzuki and Misawa 1997). There are complicated interactions among opioid receptor types. The activation of the *kappa* opioid receptor suppresses physical and psychological dependence on *mu* and *delta* opioid receptor agonists, but the activation of the *delta* opioid receptor potentiates the dependence on *mu* opioid receptor agonists. Various studies provide arguments to support substantial roles for *mu*-opioid receptors and the possible involvement of *delta*-opioid receptors in the development of physical and psychological dependence on morphine (Narita et al. 2001; Suzuki and Misawa 1997).

Most of the drugs used clinically that are mu-opioid analgesics are habit-forming. While both receptor types (delta and mu) provide analgesia, only the mu-opioid receptors lead to tolerance and dependency. Opioid agonists (stimulators) such as morphine and other drugs (meperidine, diphenoxylate, methadone, dextramethorpan, codeine, fentanyl, heroin, and tetrahydrocannabinol) exert their activity mainly at the mu receptor (Gaveriaux-Ruff and Kieffer 2002; Narita et al. 2001; Pasternak 2003; Suzuki and Misawa 1997). From behavioural, biochemical and molecular biological studies, it is suggested so far that development of physical dependence on morphine results predominantly from an activation of mu 1 and mu 2 opioid receptors which cause functional changes in Gi/o, adenylate cyclase, protein kinases A and C, beta-adrenoceptor and NMDA receptor in the locus coeruleus. However, activation of the mesolimbic dopamine system may lead to psychological dependence on opioids (Narita et al. 2001; Suzuki and Misawa 1997).

It is well known that mu and delta opioid receptor agonists produce psychological dependence, while kappa opioid receptor agonists produce an aversive effect, i.e. dysphoria rather than euphoria (Kumor et al. 1986; Rothman et al. 2000). Recently, there have been significant advances in studies on the role of kappa opioid receptor agonists in producing an aversive effect of other stimulants such as morphine, cocaine, THC, alcohol, and in other non-opioid addictions (Cui et al. 2000; Hahn et al. 2000; Collins et al. 2001; Mori et al. 2002; Raffa et al. 2003; Rosin et al. 1999; Rothman et al. 2000; Schenk et al. 1999; Tao et al. 1994). The activation of kappa-receptors also leads to the suppression of unpleasant mu/delta-mediated side effects such as dependence and respiratory depression. Considering the functional interaction between opioid receptor types, the co-administration of morphine-like compounds with kappa-receptor agonists may constitute a preferable and superior approach to the treatment of pain with fewer side effects (Narita et al., 2001).

Salvinorin A is unique in that it is a potent, non-nitrogenous, selective kappa opioid agonist distinct in its actions from other known opioid agonists. Therefore, it appears to be devoid of the mainly mu receptor-mediated side effects such as dependence and respiratory depression associated with morphine and its other analogues. It may thus be possible to use salvinorin A to treat heroin, cocaine, alcohol and amphetamine dependency, depression, and even excessive marijuana use. Being defined by its selectivity for the kappa class of opioid receptor, salvinorin A has the potential to offer a non-habit forming alternative. It may also reduce the effects of physical and emotional dependence by its antidepressive action (Hanes, 2001).

In conclusion, on the basis of available scientific literature, the potential addiction or dependence effects of *Salvia divinorum* are expected to remain very low because of the following:

- Most of the drugs which cause dependence and addiction are mu-opioid agonists, while salvinorin A acts as a full agonist at kappa opioid receptors and appears to possess no mu opioid receptor activity.

- Kappa opioid receptor agonists are characterized as being able to modulate dependence-related behavioural effects of drugs like morphine and cocaine rather than causing dependence.
- There have been no cases of dependence on *Salvia divinorum* or salvinorin A reported in the scientific literature.
- The precise mechanism of interaction between salvinorin A and the brain to produce its hallucinogenic effects remains unclear.
- The toxicity of salvinorin A is relatively low, even at doses many times greater than what humans are exposed to (Mowry et al., 2003).
- Many individuals have reported experiencing negative effects (bitter taste, unpredictable and occasionally disturbing short-term mental effects) during their first experience with *Salvia divinorum* and indicate that they would not use it a second time.

#### ***Canadian Reports of Adverse Reactions to Salvia divinorum Products***

The Canadian Adverse Drug Reaction Monitoring Program within the Marketed Health Products Directorate (MHPD) has received four reports of adverse reactions (ARs) associated with products said to contain *Salvia divinorum*, used for its hallucinatory effects. MHPD has conducted causality assessments on the four Canadian case reports associated with the use of *Salvia divinorum* products. All the reported ARs relate to neuropsychological effects. Specifically, three cases (27 year-old female, 56 year-old female, 28 year-old male) were associated with inhalation of *Salvia divinorum* with reported brief hallucinogenic effects, which were considered to be non-serious reactions requiring no medical intervention. The fourth case was associated with the oral consumption of tablets said to contain *Salvia divinorum* and concomitant use of alcohol in a 16 year-old male, with reported adverse reactions of psychosis and amnesia which were considered to be serious and required medical intervention.

#### **PRESENT HEALTH CANADA ACTIONS:**

1. Adverse reactions to *Salvia divinorum* or salvinorin A reported through the Canadian Adverse Drug Reaction Monitoring Program (CADRMP) and those reported in the United States and other jurisdictions are being monitored continuously, recognizing that it is unlikely that adverse reaction reports for these substances will be adequately documented due to *Salvia divinorum*'s use primarily as an hallucinogen. Some information might also be available from Poison Control Centres but there is apparently no uniform means for communication between Poison Control Centres at this time.
2. Health Canada's Office of Controlled Substances has placed *Salvia divinorum* on its list of substances to monitor. As part of this action, the Office of Controlled Substances is collecting relevant information specific to this herb and its active constituents.
3. A Customs Lookout is already in place and should be continued to restrict importation.

4. *Salvia divinorum* and its active principles are being represented for use in modifying organic functions in humans and are therefore classified as health products that fall under the jurisdiction of the *Food and Drugs Act*. To protect the health of Canadians, they are subject to compliance actions by the Health Products and Food Branch Inspectorate in accordance with their Policy 0001.

**NEXT STEPS:**

1. If the information collected warrants further action, the Office of Controlled Substances will assess *Salvia divinorum* against the criteria used for adding substances to the appropriate schedule of the *Controlled Drugs and Substances Act*. These criteria include:
  - international requirements and trends in control/scheduling;
  - chemical and pharmacological similarity to other drugs listed in the CDSA;
  - dependence potential;
  - likelihood of abuse/misuse;
  - extent of abuse/misuse in Canada;
  - danger to public health and safety, and
  - legitimate use in Canada.
2. If *Salvia divinorum* is added to one of the Schedules to the *Controlled Drugs and Substances Act* it will become subject to compliance actions by the federal, provincial, and municipal police forces instead of the HPFB Inspectorate.

**Media Lines**  
**Salvia divinorum**

**Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Key msg now is that we ~~have~~ are taking steps -

**Key Messages:**

• Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.

Deleted: Health Canada advises  
Deleted: to

• Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

Deleted: its

It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

• Health Canada has studied the available information about *S. divinorum* and has analyzed the options available to manage the risks associated with the availability of this substance in Canada. Health Canada has determined that a Notice of Intent to schedule *S. divinorum* and salvinorin A under the *Controlled Drugs and Substances Act (CDSA)* will be issued. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Deleted: will continue to collect and  
Deleted: y  
Deleted: as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the  
Deleted: best way to manage  
Deleted: its

I think this is coming to key messages

**Supplementary Messages:**

***Salvia divinorum* as a controlled substance:**

• In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are currently regulated under the *Controlled Drugs and Substances Act (CDSA)*.

D  
supp msg.

split into 3 key msgs  
• HC analysed info and determined it should be sched under CDSA  
• HC will publish an NOI to inform and split stakeholders to determine the number  
• HC will initiate the a total process to  
- 0 in det

- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

#### Questions and Answers:

##### **Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the Natural Health Product Regulations, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act (CDSA)*. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Formatted: Font: 12 pt

##### **Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

##### **Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

##### **Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act (CDSA)* is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act (CDSA)*. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Formatted: Font: 12 pt

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

**Deleted:** Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.¶

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

### Media Lines *Salvia divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### Key Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Health Canada has studied the available information about *S. divinorum* and has analyzed the options available to manage the risks associated with the availability of this substance in Canada. Health Canada has determined that a Notice of Intent to schedule *S. divinorum* and salvinorin A under the *Controlled Drugs and Substances Act* (CDSA) will be issued. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

#### Supplementary Messages:

##### *Salvia divinorum as a controlled substance:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are currently regulated under the *Controlled Drugs and Substances Act* (CDSA).

- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

### Questions and Answers:

#### Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act (CDSA)*. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Comments from David

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of their hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of [REDACTED] 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has reviewed the available information regarding *Salvia divinorum*, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA. The purpose of this Notice will be to inform interested parties of Health Canada’s proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

#### In Other Countries

Deleted: its

Deleted: Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

### Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to the regulation of *S. divinorum* in Canada. Health Canada also continues to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

**Deleted:** decision-making regarding  
**Comment [S1]:** Not sure if we should re-state info about NOI here?

yes

### Need More Info?

- Complaints about the illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.

since we are moving forward with scheduling, our role is to continue to collect info but more important to use the DOJ regarding our intent to control under the CDSA.

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of their hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of [REDACTED] 2010 no products containing *S. divinorum* or *salvinorin A* have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has reviewed the available information regarding *Salvia divinorum*, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA. The purpose of this Notice will be to inform interested parties of Health Canada’s proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

#### In Other Countries

Deleted: its

Deleted: Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to the regulation of *S. divinorum* in Canada. Health Canada also continues to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

← should we re-state info re: NOI here?

Hi Tiffany,

Here is the current IAS for salvia. As previously stated I have yet to incorporate some changes from the Director, OCS (so it has not been approved) and it will be updated again pending comments from the NOI. Hi Stephanie,

Thanks for your note.

Based on what I heard today I think Suzanne would like to see the comments based on the last CSS-WG meeting (Oct 27th) that were provided to you. In addition, she would like to see whether or not the IAS has incorporated all the changes thus far that have been given throughout the entire review process to see if these have been integrated into the current document.

Suzanne is aware that the document has not receive approval and the NOI comments have not been incorporated. As a result, can you send me the most recent version you have.

Let me know if you have any further questions.  
Tiffany

---

Hi Tiffany,

Denis mentioned to me that Suzanne stated at today's CSS-WG meeting (sorry I couldn't attend due to a scheduling conflict) that she would like for the group to see an updated version of the IAS. I recall from the last meeting that Suzanne felt that ODARS did not have time to provide in depth comments with regard to the scientific sections of the IAS and would provide comments at a later date. I haven't received any other comments, so I'm wondering if ODARS would like to provide them before I send you the latest version of the IAS? I am happy to provide the current IAS (though please keep in mind it is not the final version as NOI comments will be incorporated). I also have to incorporate some grammatical changes from Jocelyn before she officially approves it.

Regards,

Stephanie

Hi Jocelyn,

Below are the salvia media lines and IYH article. This is not urgent, but if possible can you revise these lines and the IYH article regarding the NOI and possible scheduling by the end of this week so we can move these products along? Cathy would like to get the lines going at the very least so we can limit the amount of media enquiries on salvia in her inbox.

On a side note, I sent these back to HPFB as well so they can correct the wording re: illegal vs. in contravention of etc...

If you have any issues or concerns, please let me know.

Thanks.

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by youth specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

Deleted: ,

Deleted: which is not currently regulated

Deleted: adolescents and young adults

1

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extracts and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or marketed as a hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL: [http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now the Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors;

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

**Deleted:** a number of

**Deleted:** including

**Comment [S1]:** JK suggested we remove 'the'; however this is how this factor is written in CSS-WG documents so I have left as is

**Comment [S2]:** Same comment as above

#### 4.2 **Assessment of *S. Divinorum* for Scheduling Purposes**

##### 4.2.1 International Requirements and Trends in the Control and/or Scheduling

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/r200111.pdf>

<sup>5</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

**Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

**Other Countries**

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

**United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marijuana.

Deleted: a  
Deleted: but  
Deleted: gency  
Deleted: j

At the state level, some state legislatures have implemented laws restricting the use, sale and/or distribution of *S. divinorum* and/or salvinorin A. As of July 2010, a number of states have placed regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

Deleted: In addition, some individual states  
Deleted: its  
Deleted: enacted legislation  
Deleted: cing

**California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

**Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> As a diterpene, salvinorin A is part of a family of substances that contain terpenoids. Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### **4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses**

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

**Comment [S3]:** Have not changed title as suggested by JK because this wording is in accordance with the agreed upon CSS-WG factors for scheduling

Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder, there has been no clinical research to support these hypotheses.<sup>30</sup> There are presently no recognized medical uses for *S. divinorum* in Canada.

Deleted: but

Deleted: That said there

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine,

<sup>26</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

<sup>31</sup> Killinger BA, Peet MM, Baker LE. Salvinorin A fails to substitute for the discriminative stimulus effects of LSD or ketamine in Sprague-Dawley rats. *Pharmacology, Biochemistry & Behaviour.* 2010 May 96; 260-265.

<sup>32</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman’s The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse.

In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the

KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms has profound hallucinogenic effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

Deleted: d

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.\*

Deleted: In some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia".

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

Formatted: English (Canada)

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdés LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

\* It should be noted that in some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia" within the survey question.

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and
- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. In conclusion, 'salvia' appears to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

Deleted: s

Deleted: however

According to the 2009 Monitoring the Future survey, the annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other controlled substances.

Deleted: illicit

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Administration (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as neither substance is listed in the *Controlled Substances Act*.

Deleted: gency

Deleted: both these

Deleted: s

Deleted: are not

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may also reflect an increased awareness of the phenomenon, rather than an increased incidence of use.

Deleted: only

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products

<sup>43</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>44</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. *Planta Med* 2007 Jun;73:1039-1046.

<sup>46</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction.* 102, 823-824.

<sup>47</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

**s.21(1)(a)**

**s.21(1)(b)**

contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

**s.21(1)(a)**  
**s.21(1)(b)**

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

s.21(1)(a)

s.21(1)(b)

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of use, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

Deleted: ab

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore the use of salvinorin A poses the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

Deleted: results in

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of their hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of [REDACTED] 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). However, Health Canada has reviewed the available information regarding *S. divinorum*, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA. The purpose of this Notice will be to inform interested parties of Health Canada’s proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

#### In Other Countries

Deleted: its

Deleted: Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

Health Canada will continue to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. Health Canada will also move forward with the regulation of *S. divinorum* and salvinorin A as controlled substances by issuing a Notice of Intent to schedule these substances under the CDSA. In the interim, Health Canada will continue to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

### Media Lines *Salvia divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada now intends to regulate *S. divinorum* as a controlled substance under the *Controlled Drugs and Substances Act* (CDSA).

#### Key Messages:

*Health Canada has determined the S. divinorum should be regulated as a controlled substance under...*

*this decision stems from the availability of*

Health Canada has studied the available information about *S. divinorum* and has analyzed the options available to manage the risks associated with the availability of this substance in Canada. Health Canada has determined that the risks associated with the use of *S. divinorum* warrant this substance's regulation as a controlled substance under the *Controlled Drugs and Substances Act* (CDSA).

- Health Canada has decided that a Notice of Intent to schedule *S. divinorum* and its main active ingredient, salvinorin A, under the *Controlled Drugs and Substances Act* (CDSA) will be issued. The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.
- Health Canada intends to initiate the regulatory process in order to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA in order to mitigate the risks associated with the use and availability of these substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The

illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Formatted: Font: Italic

**Current status of *Salvia divinorum* as a controlled substance:**

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are currently regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act* (CDSA). The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Formatted: Font: 12 pt

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada.

Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and plans to issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act* (CDSA). The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

Formatted: Font: 12 pt

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

Deleted: Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.¶

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Jocelyn,

Below are the salvia media lines and IYH article. This is not urgent, but if possible can you revise these lines and the IYH article regarding the NOI and possible scheduling by the end of this week so we can move these products along? Cathy would like to get the lines going at the very least so we can limit the amount of media enquiries on salvia in her inbox.

On a side note, I sent these back to HPFB as well so they can correct the wording re: illegal vs. in contravention of etc...

If you have any issues or concerns, please let me know.

Thanks.

### Media Lines *Salvia divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has now determined that *Salvia divinorum* should be included in one of the schedules to the *Controlled Drugs and Substances Act* (CDSA).

#### Key Messages:

- Health Canada has determined that *S. divinorum* should be regulated as a controlled substance under the *Controlled Drugs and Substances Act* (CDSA). The decision is based on the analysis of the information available about *S. divinorum* as well as an assessment of the possible options to manage the risks associated with the availability of this substance in Canada.
- Health Canada will issue a Notice of Intent to schedule *S. divinorum* and its main active ingredient, salvinorin A, under the *Controlled Drugs and Substances Act* (CDSA). This Notice will inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.
- The publication of the Notice of Intent is the first step in the regulatory process to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA in order to mitigate the risks associated with the use and availability of these substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN).

Formatted: Font: Italic

**Current status of *Salvia divinorum* as a controlled substance:**

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are currently regulated under the *Controlled Drugs and Substances Act* (CDSA).
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and will issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act* (CDSA). The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of their hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

As of [REDACTED] 2010 no products containing *S. divinorum* or *salvinorin A* have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). However, Health Canada has reviewed the available information regarding *S. divinorum*, and will issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA. The purpose of this Notice will be to inform interested parties of Health Canada’s proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

#### In Other Countries

Deleted: its

Deleted: Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

Health Canada will continue to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. Health Canada will also move forward with the regulation of *S. divinorum* and salvinorin A as controlled substances by issuing a Notice of Intent to schedule these substances under the CDSA. In the interim, Health Canada will continue to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. ~~As of December~~ 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Grammar!

no need to be specific  
could say

"At present,  
...."

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “Need More Info?” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Because of their hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- a Natural Product Number (NPN); or
- an Exemption Number (EN); or
- a Drug Identification Number - Homeopathic Medicine Number (DIN-HM).

Deleted: its

At present,

~~As of DATE 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.~~

Grammar!

and has recently issued a

While

~~Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). However, Health Canada has reviewed the available information regarding *S. divinorum*, and will issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the CDSA. The purpose of this Notice will be to inform interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.~~

as controlled

that it intends to

informing

under the CDSA.

#### In Other Countries

Deleted: Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

and a salvinorin A (with circled A) its active ingredient

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. For example, in some states it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

### Health Canada's Role

Health Canada will continue to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. ~~Health Canada will move forward with the regulation of *S. divinorum* and salvinorin A as controlled substances by issuing a Notice of Intent to schedule these substances under the CDSA. In the interim, Health Canada will continue to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the Department becomes aware of any unauthorized health products that may pose a risk to Canadians.~~

### Need More Info?

- Complaints about the illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)

Remarks / Remarques

Needs a bit of a rewrite due to shift in approach, i.e.

Step 1: NOI + media lines to support  
Step 2: (when NOI posted) release of IYH

Ergo language in two docs has to be different.

Would suggest that next package focus on revised lines + draft NOI as two should move together

IYH can go later.

Happy to discuss  
JK

Media Lines  
Salvia divinorum

Issue

~~Since 2006, Health Canada has noted ongoing media interest regarding the availability of Salvia divinorum in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of Salvia divinorum, particularly given reports from scientific and media sources suggesting that Salvia divinorum is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has now determined that Salvia divinorum should be included in one of the Schedules to the Controlled Drugs and Substances Act (CDSA).~~

Further to

and Salvinorin A?

Key Messages:

- Health Canada has determined that *S. divinorum* should be regulated as a controlled substance under the *Controlled Drugs and Substances Act* (CDSA). The decision is based on the analysis of the information available about *S. divinorum* as well as an assessment of the possible options to manage the risks associated with the availability of this substance in Canada.
- Health Canada will issue a Notice of Intent to schedule *S. divinorum* and its main active ingredient, salvinorin A, under the *Controlled Drugs and Substances Act* (CDSA). This Notice will inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.
- The publication of the Notice of Intent is the first step in the regulatory process to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA in order to mitigate the risks associated with the use and availability of these substances.

stating that it intends to add

to Schedule III to the CDSA

inclusion provide

and with the opp to comment on

Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN).

~~Current status of *Salvia divinorum* as a controlled substance:~~

- ~~In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are currently regulated under the *Controlled Drugs and Substances Act* (CDSA).~~
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) <sup>who have also</sup> have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. ~~Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.~~

Questions and Answers:

It is also consistent with the fact that

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of a Natural Health Product (NHP) under the Natural Health Product Regulations, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and will issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the Controlled Drugs and Substances Act (CDSA). The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.

does not really fit with Q

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The Natural Health Products Regulations apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When Salvin-D and Sal A are included in Schedule III to the CDSA, it will be illegal to possess, import, export, distribute etc them in any form.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – ~~*Salvia divinorum* products that are not in compliance with the Natural Health Products Regulations may be subject to compliance and enforcement action by Health Canada.~~

needs to be post scheduling 1st

When Salvin D and Sal A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activity. In the interim,

Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

*recently concluded its assessment of Salv D and Salvia A against the above mentioned factors and has decided*

~~Health Canada has reviewed the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, and will issue a Notice of Intent to include *S. divinorum* and salvinorin A in one of the schedules to the *Controlled Drugs and Substances Act* (CDSA). The purpose of this Notice will be to inform stakeholders and other interested parties of Health Canada's proposal to regulate these substances as controlled substances, as well as to allow the public to provide comments on the proposal.~~

*intends to include both substances in Sched III to the*

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

*remove no longer relevant CDSA*

**Deleted:** Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.¶

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

DRAFT

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of substances to the schedules to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to the schedules to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are <sup>usually</sup> chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the schedules to the *Controlled Drugs and Substances Act*.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. However, neither of these substances have been approved as natural health products under the *Natural Health Products Regulations*. It is illegal to sell drugs or natural health products in Canada, unless they have been reviewed and authorized for sale by Health Canada. (Health Canada has also noticed an increase in public interest and media attention surrounding these substances.)

*S. divinorum* and salvinorin A are pharmacologically similar to other substances included in schedules to the CDSA, such as LSD and psilocybin. Very little is known about the long-term effects of the use of *S. divinorum* and salvinorin A. There is also evidence of abuse of these substances, particularly by Canadian youth. Health Canada is thus concerned that these substances pose a risk to the health and safety of Canadians and is therefore considering regulating them as controlled substances.

Although these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both of these substances as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Although some individual American states have implemented laws restricting its use, sale and/or distribution, *S. divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Placing these substances within the scope of the CDSA may prohibit any or all of the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production ~~or~~ (cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any legitimate industrial or medical uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate scheduling under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of a proposed regulatory amendment in *Canada Gazette*, Part I. This is expected to take place in 2011.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Hello Stephanie,

DEPARTMENT OF HEALTH  
CONTROLLED DRUGS AND SUBSTANCE

Notice to interested parties - Proposal regarding A to the schedules to the Controlled Drugs and

This notice provides interested stakeholders with comments on Health Canada's proposal to add active ingredient salvinorin A to the schedules (CDSA), and to identify themselves for inclusion

*Salvia divinorum* is a species of sage belonging to the mint family. It is often chewed or smoked to obtain psychotropic effects which include hallucinations, dysphoria, out-of-body experiences, and memory loss. The effects, which vary from person to person, can be unpleasant. Neither *S. divinorum* nor salvinorin A are currently listed in the CDSA.

- publish on website.

The list of stakeholders is basically derived from best guess/estimate for this NOI. For instance, NHP shops, plant/flower shops, plant breeders?, etc. The NOI also serves to have stakeholders come up and identify themselves.

I think the NOI is self explanatory at this point. It will simply be a matter of getting approval from Jocelyn.

read catalogues. Hope this helps.

we can discuss

Daniel

Hi Daniel,

Here is the draft NOI for Salvia (though it should be noted that Jocelyn has not approved the IAS yet).

I'm also wondering how to go about creating a list of stakeholders to contact regarding the NOI. Elizabeth has one for BZP, but a lot of the contacts would not be applicable for Salvia. Can we discuss?

Thanks,  
Stephanie

Health Canada has also noticed an increase in public substances.

Salvia is very similar to other substances included in the bin. Very little is known about the long-term effects of salvinorin A. There is also evidence of abuse of these substances. Health Canada is thus concerned that these substances are being used by Canadians and is therefore considering

Salvia is included in any of the United Nations Drug Control Conventions. It is proposed to regulate one or both of these substances as controlled substances. Finland, Germany, Italy, Japan, South Korea, and the United States are on the import and/or sale of *S. divinorum*. Some American states have implemented laws regulating *S. divinorum* and salvinorin A are not regulated under the Controlled Substances Act in the United States.

The CDSA may prohibit any or all of the following activities by regulation: possession, trafficking, importation, exportation, possession for the purpose of

DRAFT V.1

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

Notice to interested parties - Proposed A to the schedules to the Controlled Substances Act  
Schedule III

This notice provides interested stakeholders with an opportunity to provide comments on Health Canada's proposed active ingredient salvinorin A to the CDSA, and to identify themselves.

*Salvia divinorum* is a species of sage that is often chewed or smoked to obtain psychotropic effects. These effects include hallucinations, dysphoria, outbursts of anger, and memory loss. The effects, which vary in intensity, are often unpleasant. Neither *S. divinorum* nor salvinorin A are listed in the CDSA.

Recently there have been reports suggesting that *Salvia divinorum* is being used for its ability to produce hallucinations. *S. divinorum* has been approved as a "legal" alternative to marijuana. It has been approved as a natural health product. It is illegal to sell drugs or natural health products that are not authorized for sale by Health Canada. Health Canada is currently receiving interest and media attention surrounding *S. divinorum*.

*S. divinorum* and salvinorin A are pharmacologically active substances listed in the schedules to the CDSA, such as LSD and marijuana. The effects of the use of *S. divinorum* and salvinorin A are similar to those of other controlled substances, particularly by Canadian youth. The use of these substances pose a risk to the health and safety of Canadians. Health Canada is currently regulating them as controlled substances.

Although these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both of these substances as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Although some individual American states have implemented laws restricting its use, sale and/or distribution, *S. divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Placing these substances within the scope of the CDSA may prohibit any or all of the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of

---

Good morning all:

We received a request from PCO, for which I am coordinating the preparation of a response for PRAD. Please provide your response to this e-mail by **10:00AM Tuesday, November 23**.

**Request:** For each of your projects that have/will require citizen engagement and/or consultation activities from **November 4, 2010 onward**, please complete and e-mail me the following information:

- Branch/DG (assumed HECSB)
- Title/Titre
- Purpose and Outcome / Objectif et résultat & Hyperlink/Hyperlien
- Timeframe / Échéance
- Type of Stakeholders / Type d'intervenants
- Lead Contact / Contact principal

Only projects led by HECSB should be included, i.e., if you are involved in a project led by another Branch, you should not include the details of that project.

Also, the PCO definitions of citizen engagement and consultation are enclosed for your reference.

[attachment "Q-555-instructions.pdf" deleted by Stephanie Chandler/HC-SC/GC/CA]

**Citizen engagement activities** include in-person events & values-based dialogues with individual citizens early on in policy/program development.

**Citizen consultation activities** include online &/or in-person or targeted emails to individual citizens and/or stakeholder groups & organizations.

- Do NOT include Canada Gazette Part I consultations.
- Do NOT include advisory bodies-- Someone else is adding this information

Thank you and please let me know if you have questions and I will try to have them addressed.

Sincerely,  
Angela

DRAFT V.2

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. Health Canada is thus concerned that *S. divinorum* and salvinorin A pose a risk to the health and safety of Canadians and is therefore considering regulating them as controlled substances.

While Although <sup>these</sup> these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Although some individual American states have implemented laws restricting its use, sale and/or distribution, *S. divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any legitimate industrial or medical uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate scheduling under the CDSA.

Hi Angela,

While we have yet to develop the actual list of stakeholders that will be used for the salvia NOI, medical practitioners (i.e. those working in hospital ERs who may see salvia cases come in, or those who have been approached by concerned parents(?)) might be interested in knowing it will be scheduled. I have included naturopathic practitioners as salvia was traditionally used as a healing plant in South America (Mexico). I realise its highly unlikely that Canadian naturopaths would use this plant, but I was thinking along the lines of being too inclusive rather than leaving someone out... (We are also waiting on NHPD to provide their list of stakeholders.)

If Denis or Daniel have other thoughts, I'm open to excluding these parties or including others who they think might be more appropriate?

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by youth specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extracts and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or marketed as a hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

---

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now the Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)**

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, or industrial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *S. Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in Control and/or Scheduling**

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of

Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years

---

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marihuana.

At the state level, some state legislatures have implemented laws restricting the use, sale and/or distribution of *S. divinorum* and/or salvinorin A. As of July 2010, a number of states have placed regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human

consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> As a diterpene, salvinorin A is part of a family of substances that contain terpenoids. Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid

(KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance (Therapeutic, Scientific, Industrial)

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches,

<sup>26</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder, there has been no clinical research to support these hypotheses.<sup>30</sup> There are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### **4.2.4 Potential for Abuse and/or Addiction Liability**

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of

<sup>33</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman’s The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of

dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms has profound hallucinogenic effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.\*

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and

---

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

\* It should be noted that in some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia" within the survey question.

- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. In conclusion, 'salvia' appears to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, the annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other controlled substances.

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Administration (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as neither substance is listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may also reflect an increased awareness of the phenomenon, rather than an increased incidence of use.

#### **4.2.6 Risk to Personal and Public Health and Safety**

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin

A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect

**s.21(1)(a)**

**s.21(1)(b)**

true incidence due to under-reporting.

**5. ASSESSMENT OF RISKS AND BENEFITS**

**6. IDENTIFICATION AND ANALYSIS OF OPTIONS**

## 7. CONSIDERATIONS

s.21(1)(a)

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

s.21(1)(b)

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the addiction potential of *S. divinorum* appears to be low, there is001766

s.21(1)(a)

s.21(1)(b)

for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of use, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore the use of salvinorin A poses the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has ~~now determined~~ <sup>is</sup> that *Salvia divinorum* should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

Deleted: Since 2006, Health Canada has noted

Deleted:

Deleted: Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given

#### Key Messages:

- Health Canada ~~has determined~~ <sup>is proposing</sup> that *S. divinorum* and salvinorin A ~~should~~ be regulated as controlled substances under the *Controlled Drugs and Substances Act* (CDSA). This decision is based on analysis of the information available about *S. divinorum* and salvinorin A as well as an assessment of the possible options to manage the risks associated with the availability of these substances in Canada.
- Health Canada will issue a *Notice to Interested Parties* (NOI) stating that it intends to add *S. divinorum* and its main active ingredient, salvinorin A, to Schedule III to the CDSA. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.
- The inclusion of *S. divinorum* and salvinorin A in Schedule III to the CDSA will mitigate the risks associated with their use and availability.

Deleted:

Deleted: ¶

Deleted: ¶

Formatted: Font: Italic

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*. ¶

- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions,
- The move to include *S. divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) who have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Questions and Answers:**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Health Canada intends to include *S. divinorum* and salvinorin A under Schedule III to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When *S. divinorum* and salvinorin A are included in Schedule III to the CDSA, it will be illegal to possess, import, export, produce and distribute these substance in any form.

*raw materials? CADA unless authorized by Regulation.*

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – Once *S. divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

**Formatted:** Font: Not Bold

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Deleted:** *alvia*

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and intends to include both substances in Schedule III to the CDSA.

*proposes*  
**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.

**Deleted:** Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.¶

¶  
**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?¶**

¶  
A5 – See A4¶

**Deleted:** 6

**Deleted:** 6

- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hello Tiffany;

I believe I said that the approximate number of records was 12 but that the numbers would be of limited use due to differences in reporting practices over time.

With more thorough searching, I have found a total of 26 (23 refused, 3 released) records of imports and attempted imports of Salvia in our databases.

I'm including some background information to be clear on the source and value of the data. These records come from two old databases used in BC and Ontario only. Other provinces, to my knowledge, were using excel and paper to track this information. These practices have since been replaced by a national database in which only refused shipments are tracked. There is no record of a refused shipment of Salvia in the national database. This may reflect decreased volume, decreased referral by CBSA, or adaptation by importers/sellers to the requirements (i.e. labelling as incense). The older ON and BC databases show a combined total of 26 records between 2003 and 2009.

All of this is meant to emphasize that careful wording is needed to avoid inaccuracy. Please feel free to give me a call if you have any questions.

Denis, the list of stakeholders who may be affected by the decision to schedule Salvia is forthcoming. I've asked Colin and his alternate on the WG to request this info from our regions.

To: Courtney Smith/HC-SC/GC/CA@HWC  
Date: 2010-11-30 08:51 AM  
Subject: Clarification

---

Hi Courtney,

At the last CSS-WG you indicated that you had verified the number of cases related to Salvia was 12 (note what I have said below from the ROD). You said this number was probably not useful but is correct that Suzanne said even though the # is small it still should be included in the IAS but with a caveat explaining

the reason why? Can you please confirm that this is what you said and the action item was that you would fwd the number and caveat to Denis? Please let me know as there is some confusion in the draft ROD over what was said.

Thanks very much,  
Tiffany

Courtney noted that she verified the importation cases at the border related to Salvia. She indicated that a total of twelve cases have been highlighted by CBSA. Suzanne indicated although limited cases exist they should be included in the IAS however a caveat should be inserted to explain the reason/s for the low number.

- Courtney to send Denis the number and caveat explanation

---

[DD/MM/2010]

#### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by youth specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extracts and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or marketed as a hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now the Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

(a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,

(b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, or industrial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *S. Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in Control and/or Scheduling**

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of

Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### ***Denmark***

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella I*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marihuana.

At the state level, some state legislatures have implemented laws restricting the use, sale and/or distribution of *S. divinorum* and/or salvinorin A. As of July 2010, a number of states have placed regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human

consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> As a diterpene, salvinorin A is part of a family of substances that contain terpenoids. Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid

(KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance (Therapeutic, Scientific, Industrial)

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches,

<sup>26</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder, there has been no clinical research to support these hypotheses.<sup>30</sup> There are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of

<sup>32</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman's The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

<sup>33</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman's The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of

dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms has profound hallucinogenic effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.\*

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and

---

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

\* It should be noted that in some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia" within the survey question.

- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. In conclusion, 'salvia' appears to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, the annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other controlled substances.

Between 2003 and 2009, the Border Integrity Unit of the Health Products and Food Branch Inspectorate (HPFBI) reported that a total of 26 (23 refused, 3 released) records of imports and attempted imports of *Salvia divinorum* products in their databases. These records represent British Columbia and Ontario only. Data for other provinces is not available. However, the practice of recording imports has since been replaced by a national database in which only refused shipments are tracked. As of November 2010, there is no record of a refused shipment of *Salvia divinorum* in the national database. This may reflect decreased volume of incoming shipments, decreased referral of such shipments by Canada Border Services Agency (CBSA), or adaptation by importers/sellers to import requirements (e.g. labelling as incense).

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Administration (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as neither substance is listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a

hallucinogen is on the rise. However, it may also reflect an increased awareness of the phenomenon, rather than an increased incidence of use.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

<sup>47</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

**s.21(1)(a)**

**s.21(1)(b)**

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## **5. ASSESSMENT OF RISKS AND BENEFITS**

## **6. IDENTIFICATION AND ANALYSIS OF OPTIONS**

<sup>48</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also

considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of use, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore the use of salvinorin A poses the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada is now proposing that *Salvia divinorum* should be included in one of the Schedules to the *Controlled Drugs and Substances Act (CDSA)*.

Deleted: Since 2006, Health Canada has noted  
Deleted:  
Deleted: Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given

#### Key Messages:

- Health Canada is proposing that *S. divinorum* and salvinorin A be regulated as controlled substances under the *Controlled Drugs and Substances Act (CDSA)*. This decision is based on analysis of the information available about *S. divinorum* and salvinorin A as well as an assessment of the possible options to manage the risks associated with the availability of these substances in Canada.
- Health Canada will issue a *Notice to Interested Parties (NOI)* stating that it intends to add *S. divinorum* and its main active ingredient, salvinorin A, to Schedule III to the CDSA. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.
- The inclusion of *S. divinorum* and salvinorin A in Schedule III to the CDSA will mitigate the risks associated with their use and availability.

Deleted:  
Deleted: ¶  
Deleted: ¶  
Formatted: Font: Italic

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Deleted: <#>Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. ¶  
It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*. ¶

- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.
- The move to include *S. divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) who have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### Questions and Answers:

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Health Canada intends to include *S. divinorum* and salvinorin A under Schedule III to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When *S. divinorum* and salvinorin A are included in Schedule III to the CDSA, it will be illegal to possess, import, export, produce and distribute these substance in any form unless authorized by regulation.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – Once *S. divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

Deleted: *alvia*

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA.

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.

**Deleted:** Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.¶

¶  
**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**¶

¶  
A5 – See A4¶

**Deleted:** 6

**Deleted:** 6

- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.
