**DRAFT V.3**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. Health Canada is thus concerned that *S. divinorum* and salvinorin A pose a risk to the health and safety of Canadians and is therefore considering regulating them as controlled substances.

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Although some individual American states have implemented laws restricting its use, sale and/or distribution, *S. divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any such legitimate uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate scheduling under the CDSA. 001800

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette*, Part I.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Health Risk Assessment of Salvia divinorum as a Health Product 2010-08-25.doc

Salvia divinorum IAS 2006-11-03.doc

At the last CSS-WG meeting we reviewed the deck "Scheduling Substances under the *Controlled Drugs and Substances Act*". On slide 7, I pointed out that "morning glory" was identified as a plant with psychoactive properties but that may be a bit misleading because the psychoactive species are not the common morning glory that people have in their gardens. I promised I would provide details by e-mail.

The psychoactive "morning glory" plant, species name *Turbina corymbosa* (L.) Raf., Convolvulaceae, widely published synonym *Rivea corymbosa* (L.) Hallier f., is better known in the scientific literature by its Mexican Nahuatl name of "Ololiuqui". Horticulturally it has the English common names "Christmaspops" or "Christmasvine." The seeds were consumed in water traditionally by the Mexican Chinotec, Mazatec, Mixtec and Zapotec peoples as a narcotic hallucinogen for purposes of divination by traditional healers. Hallucinations occur during the somnambulistic stage of intoxication.

The psychoactive properties are due to biosynthesis of ergoline alkaloids by fungi of the order Clavicipitales (related to ergot) that colonize the adaxial (upper) leaf surface and seeds of certain members of the morning glory family, especially *Turbina corymbosa* and *Ipomoea asarifolia*. A closely related fungus is found on *Ipomoea violacea*. The fungus-derived ergoline alkaloids: chanoclavine, lysergic acid-alpha-hydroxyethylamide, lysergic acid amide, and ergonovine, accumulate in the leaves and seeds of the host plant. The fungi are seed-transmitted to the next generation of plants.

The common garden morning glory is *Ipomoea purpurea* (L.) Roth. Additional horticultural species include *I. pes-caprae*, *I. pandurata*, *I. carnea*, *I. cairica*, *I. quamoclit*, *I. tricolor*, *I. hederifolia*, *I. nil*, *I. aquatica*, *Convolvulus tricolor*, *Argyreia nervosa*, and *Merremia tuberosa*. The wild morning glory or bindweed plants that infest our gardens as noxious weeds are *Convolvulus arvensis* L. (small-flowered) and *Calystegia sepium* (L.) R.Br. (greater bindweed).

**Media Lines**  
*Salvia divinorum*

**Issue**

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act (CDSA)*.

Deleted: Since 2006, Health Canada has noted  
Deleted:  
Deleted: Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given  
Deleted:

**Key Messages:**

- Health Canada is proposing that *S. divinorum* and salvinorin A be regulated as controlled substances under the *Controlled Drugs and Substances Act (CDSA)*. ~~Further to an analysis of the information available about *S. divinorum* and salvinorin A and the risks associated with the availability of these substances in Canada.~~
- Health Canada intends to inform stakeholders of its decision via the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.
- The inclusion of *S. divinorum* and salvinorin A in the Schedules to the CDSA will mitigate the risks associated with their ready availability and potential abuse.

Formatted: Font: Italic

make  
bullet #2

**Supplementary Messages:**

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*. ¶

- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions,
- The move to include *S. divinorum* and salvinorin A in the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### Questions and Answers:

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

**Deleted:** 1

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Deleted:** 1

**Deleted:** Because

**Deleted:** n

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

**Deleted:** Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*. ¶

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When *S. divinorum* and salvinorin A are included in the

**Formatted:** Font: Italic

**Deleted:** 2

**Deleted:** 2

Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

Deleted: 3

A4 – Once *S. divinorum* and salvinorin A are included in the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Deleted: 3

Formatted: Font: Not Bold

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Deleted: alvia

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

Deleted: Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:  
<#>International requirements and trends in international control;  
<#>Chemical and pharmacological similarity to other substances already regulated under the CDSA;  
<#>Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);  
<#>Potential for abuse and risk of addiction associated with the substance;  
<#>Extent of actual abuse of the substance in Canada and internationally; and  
<#>Overall risk to public health and safety posed by the substance.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

A5 – See A4

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;

Deleted: 6

Deleted: 6

Deleted: substance

- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**DRAFT V.4**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that their ready availability poses a risk to the health and safety of Canadians.

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some individual American states have also implemented laws restricting its use, sale and/or distribution.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any such legitimate uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA, as required.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette*, Part I.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

As *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that their ready availability poses a risk to the health and safety of Canadians.

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some individual American states have also implemented laws restricting its use, sale and/or distribution.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any such legitimate uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA, as required.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette*, Part I.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

# Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use

Cathi E Dennehy, Candy Tsourounis, and Amy E Miller

---

**BACKGROUND:** The Internet is a popular tool for marketing and purchasing herbal dietary supplements (DS). Various Web sites sell these products purely for recreational use.

**OBJECTIVE:** To describe the content of Web sites that advertise and market herbal DS for recreational use (ie, for the purpose of altering mood/behavior/or perception, "getting high," or as a substitute for a drug of abuse).

**METHODS:** Four major search engines and the search terms "buy herbal high" and "buy legal high" were used to identify Web sites selling herbal DS for recreational use. Web sites were evaluated for their country of origin and for compliance with the Dietary Supplement Health and Education Act (DSHEA). Products were evaluated for their ingredient lists, effect claims, comparisons with illicit drugs, adverse effects, drug interactions, and contraindications.

**RESULTS:** Twenty-eight unique Web sites with 119 products were evaluated. Most sites were in the US (54%) and were in compliance with DSHEA. Forty-seven percent of the products were likened to illicit drugs, typically marijuana (48%) or 3-,4-methylene dioxymphetamine (Ecstasy; 23%). The most common product ingredients were ephedra alkaloids (27%), *Salvia divinorum* (17%), kava (10%), guarana (10%), *Acorus calamus* (10%), and damiana (10%). Effect claims frequently involved the products' use as a hallucinogen (51%) or stimulant (39%). Sixty-four percent of the sites mentioned adverse effects, and 54% mentioned drug interactions.

**CONCLUSIONS:** This study demonstrates that herbal DS are being marketed for use as legal alternatives to illicit drugs of abuse. Healthcare professionals need to be aware of this trend and the products that are involved.

**KEY WORDS:** Internet, recreational dietary supplement, recreational herb.

*Ann Pharmacother* 2005;39:1634-9.

Published Online, 13 Sept 2005, [www.theannals.com](http://www.theannals.com), DOI 10.1345/aph.1G185

---

The 2003 National Survey on Drug Use and Health (NSDUH) indicated that 8.2% of Americans use illicit drugs, with the highest prevalence among those 18–20 years old. Marijuana was used most frequently, followed by psychotherapeutic agents (eg, prescription pain relievers, tranquilizers, stimulants, sedatives), cocaine, hallucinogens (including lysergic acid diethylamide, phencyclidine, peyote, mescaline, mushrooms, 3-,4-methylene dioxymphetamine [Ecstasy]), and inhalants.<sup>1</sup>

Herbal dietary supplements (DS) have also been used for recreational purposes (eg, to alter mood, perception,

behavior). Emergency care and hospitalizations have been reported in persons ingesting moonflower (*Datura innoxia*), Hawaiian baby woodrose (*Argyrea nervosa*), and "Herbal Ecstasy" products.<sup>2-5</sup>

DS are regulated by the Food and Drug Administration (FDA) under the Dietary Supplement Health and Education Act (DSHEA). DSHEA requires that products being sold as DS be labeled as such. It also requires manufacturers making product structure–function claims to state the FDA disclaimer, "This statement has not been evaluated by the FDA. This product is not intended to diagnose, treat, cure, or prevent any disease."<sup>6</sup>

The Internet is a discreet and easy method of marketing and purchasing supplements. Given the popularity of this market, there has been an emergence of Web sites marketing DS purely for recreational use. The objective of this

---

Author information provided at the end of the text.

This research was presented as a poster at the American College of Clinical Pharmacy Annual Meeting, September 2004, Dallas, TX.

study was to describe the content of these Web sites and their products.

## Methods

In February 2004, an Internet search was performed using Google, Yahoo!, AOL, and MSN.<sup>7,8</sup> Search terms were "buy herbal high" and "buy legal high." These terms were chosen after testing numerous search term combinations and determining that these terms retrieved the most sites. The first 100 Web sites for each search term and search engine were screened, and the first 20 unique sites were reviewed. Web sites were included if they claimed to sell herbal DS to US consumers for recreational use. "Recreational use" was defined as the use of a product for the purpose of altering mood/behavior/or perception, "getting high," or as a substitute for an illicit drug. Products marketed solely as aphrodisiacs or sexual stimulants were excluded.

Our selection of products for review was based on Web site presence (ie, prominence of an item on the Web site) until a maximum of 5 products had been evaluated. Products that appeared on the home page and received a majority of the advertising space were evaluated first, followed by the "top seller" or "best seller" links, then followed by the first product appearing under the links provided.

Web site coding took place in February and March. Two investigators evaluated each site separately. Web sites were evaluated for location (US or other), presence of seller's contact information, and, if located in the US, compliance with the DSHEA. Web sites were considered compliant if they identified their products as DS and listed the FDA disclaimer if a structure-function claim was present.

Products were evaluated for their ingredient list, effect claims (eg, hallucinogen, stimulant, sedative), presence of testimonials or journal articles to support effect claims, comparisons with illicit drugs, adverse effects, drug and disease interactions, contraindications, and formulation. If no ingredient list was provided but contact information was present, one investigator E-mailed the company with the phrase, "I'm interested in trying this product. Can you tell me what's in it?" If no reply was received and the company was located within the US, we attempted to phone the manufacturer. Effect claims were grouped (Table 1).

## SURVEY TOOL AND INTERRATER RELIABILITY

The survey tool was designed so that, if a particular item (eg, structure or function claim, adverse effect claim) appeared on the Web site, it would be recorded as "yes" or, if absent, as "no." Additional descriptive information was recorded using the terminology listed on the Web site. After both investigators had completed their coding, all responses were compared for interrater reliability. If discrepancies existed, the investigators met, revisited the Web site, and came to a consensus. Interrater reliability was performed using Cohen's kappa statistic, where a value of >0.7 was considered satisfactory.<sup>9</sup>

## COMPLIANCE WITH EPHEDRA BAN

In February 2004, the FDA had just published a final rule declaring that DS containing ephedra alkaloids were adulterated because of the risk of illness and injury to consumers. The ban prohibited the sale of DS containing ephedra, *ma huang*, *Sida cordifolia*, or *Pinellia* spp. and re-

quired that these supplements be removed from the market by April 12, 2004.<sup>10,11</sup> After the study was completed, Web sites distributing ephedra products were revisited to check for compliance with this ban.

## Results

### WEB SITE SUMMARY

Twenty-eight Web sites were identified, and 119 products were evaluated (average 4.3 products per Web site). The majority of the suppliers were located in the US (54%, n = 15) and the UK (36%, n = 10). There was one site in the Netherlands and one in Canada; another did not specify a location. Products on all foreign Web sites stated that they would ship products to the US.

The 15 US-based sites were evaluated for compliance with DSHEA. Among these, 73% (n = 11) identified one or more product as a DS, 93% (n = 14) made at least one structure-function claim, and 67% (n = 10) included the FDA disclaimer.

### PRODUCTS AND INGREDIENTS

Products that occurred with a frequency of ≥2% are listed in Table 2. Of the 119 products evaluated, *Salvia divinorum* was the most prevalent. Web sites that sold *Salvia* often included an "S-A-L-V-I-A scale," where the "trip" was described in levels dependent on the amount ingested (Table 3).<sup>12</sup> Many sites selling *Salvia* recommended that the user have a "sitter" (a person not under the influence of any mind-altering substance) to oversee their behavior for safety reasons.

Seventy-seven percent (n = 92) of the products provided an ingredient list; ingredient lists for an additional 9% (n = 11) were obtained by contacting the company by E-mail or phone. No ingredient list was identified for 16 products. The most common product ingredients are listed in Table 4. Ephedra was the most common product, followed by *Salvia*. The majority of products were single- (59%) versus multi-ingredient (41%).

### EFFECT CLAIMS

Forty-seven percent (n = 56) of the products were likened to a specific illicit drug. The most common were marijuana (48%), Ecstasy (23%), LSD (14%), cocaine or speed (13%), and mushrooms (5%). A small percentage (5%) of suppliers also likened their products to benzodiazepines, opium, and "roofies" (ie, flunitrazepam). In 7% of the cases, more than one illicit drug was cited as being similar to a DS product.

Seventy-nine percent (n = 94) of the products advertised effect claims. The claims were generally supported by testimonial evidence (94%, n = 15) compared with journal citations (6%, n = 1) and were present on 57% (n = 16) of the 28 Web sites. Fifty-one percent (n = 48) of the products were categorized as hallucinogens, 39% as stimulants, 31% as euphoria producing, and 24% as sedatives. Products that qualified as stimulants most commonly contained

Table 1. Characterization of Effect Claims

Effect Claim	Description
Sedatives	have sedative or relaxing effects; decrease stress and anxiety
Euphorics	enhance mood; produce a state of euphoria
Hallucinogens	expand the mind; produce hallucinations; have psychedelic properties
Stimulants	increase energy; have stimulant, cocaine, or speed-like effects

CE Dennehy et al.

ephedra and made claims such as increasing emotional energy or mental clarity.

### Adverse Effects, Contraindications, and Drug Interactions

Sixty-four percent (n = 18) of the Web sites stated at least one or more potential adverse effect, with the most common (68%, n = 14) being impaired motor coordination, which was implied by the disclaimer, "Do not drive or operate machinery after using this product." Thirty-nine percent of the sites also reported nausea as a possible adverse effect. Other adverse effects that were listed with a frequency  $\geq 10\%$  included nervousness (22%), tremor (22%), insomnia/sleeplessness (22%), loss of appetite (22%), headache (22%), increased heart rate (17%), dizziness (11%), and mucous membrane irritation (11%).

Fifty-seven percent (n = 16) of the Web sites reported at least one contraindication to product use and 54% (n = 15) reported one or more drug interaction. The most common contraindication was a standard disclaimer present on 75% (n = 12) of sites that stated, "Do not use this product if you are pregnant or nursing, or if you have heart disease, thyroid disease, diabetes, high blood pressure, depression or other psychiatric condition, glaucoma, difficulty urinating, prostate enlargement, or a seizure disorder." Similarly, the

most common drug interaction was also part of the above disclaimer and included the phrase, "Do not use this product if you are using a monoamine oxidase inhibitor (MAOI), any other prescription drug, or an over-the-counter drug containing ephedrine, pseudoephedrine, or phenylpropranolamine (ingredients found in certain allergy, asthma, cough/cold, and weight control products)." Of the Web sites stating this disclaimer, 50% (n = 8) sold ephedra-containing products and 38% (n = 6) sold *Salvia*. Other contraindications that occurred with a frequency  $\geq 10\%$  included hepatitis (13%), liver disease (13%), and the use of alcohol (13%).

### FORMULATION

Products were most often delivered as pills for oral administration (52%, n = 62) or in a cigarette-based or loose, leaf form that could be smoked (47%). Four percent of products did not state a delivery method, 4% recommended use as incense, and 1% recommended sublingual administration. In 8% of the cases, products listed more than one delivery method (eg, ingested orally or smoked).

### INTERRATER RELIABILITY

Kappa values for interrater reliability met our predefined cut-off level for satisfactory agreement, except for

Table 2. Commonly Encountered Products

Product	Frequency, % (n)	Ingredient	Likened to	Claim
<i>Salvia</i>	15 (18)	<i>Salvia divinorum</i>	marijuana, LSD	hallucinogen
Bliss Extra	5 (6)	<i>Acorus calamus</i> , <i>Sida cordifolia</i> , Siberian ginseng, L-phenylalanine, GABA	Ecstasy <sup>a</sup>	euphoric, hallucinogen, stimulant
EX-1	5 (6)	<i>Sida cordifolia</i>	speed <sup>b</sup>	euphoric, stimulant
Druids Fantasy	3 (4)	morning glory, Hawaiian baby woodrose ( <i>Argyreia nervosa</i> ), <i>Acorus calamus</i> , Siberian ginseng, kava kava	LSD	hallucinogen
Trip2Night	3 (3)	<i>ma huang</i> , guarana, 5-HTP, Bioperine, Indian bromine, cinnamon, cola nut, niacin, Fo-ti	Ecstasy, <sup>a</sup> LSD	stimulant
Absinthe herb	2 (2)	<i>Artemisia absinthium</i>	marijuana, LSD	hallucinogen
Damiana <sup>c</sup>	2 (2)	damiana herb	marijuana	aphrodisiac, euphoric, sedative
Hawaiian baby woodrose	2 (2)	<i>Argyreia nervosa</i>	LSD	euphoric, hallucinogen, stimulant
Hawaiian Herbal Hybrid Buds	2 (2)	lettuce opium ( <i>Lactusa virosa</i> )	marijuana	euphoric
Kanzak	2 (2)	Kanna	NA	euphoric, sedative
Kratom	2 (2)	<i>Mitragyna speciosa</i>	marijuana	euphoric, hallucinogen, stimulant
Red Dawn	2 (2)	guarana, 5-HTP, Bioperine, Indian bromine, cinnamon, cola nut, niacin, Fo-ti	NA	aphrodisiac, euphoric, stimulant
Road Runner Super	2 (2)	<i>Sida cordifolia</i> , Siberian ginseng, GABA, L-taurine, <i>Paulina cupana</i> <sup>d</sup>	speed <sup>b</sup>	stimulant
Uraeus Liquid Speed	2 (2)	guarana, gotu kola, <i>Ginkgo</i> , lemon balm	speed <sup>b</sup>	hallucinogen, stimulant

GABA =  $\gamma$ -aminobutyric acid; 5-HTP = 5-hydroxytryptophan; LSD = lysergic acid diethylamide; NA = not applicable.

<sup>a</sup>3,4-methylene dioxymethamphetamine.

<sup>b</sup>Amphetamine or methamphetamine.

<sup>c</sup>There were 2 single-ingredient damiana products and an additional 8 products that included damiana as part of a multi-ingredient list.

<sup>d</sup>A form of Brazilian guarana.

Evaluation of Herbal Dietary Supplements Marketed for Recreational Use

the 3 questions related to compliance with DSHEA. An overall kappa statistic of 0.48 was calculated for these 3 questions, as there were only 15 responses (ie, based on number of US sites) for each.

COMPLIANCE WITH EPHEDRA BAN

Initially, 54% (n = 15) of the sites had been selling ephedra products; 7 of these were located in the US. By May 2004, 6 of those suppliers had removed these products from their Web site. Among the 8 foreign distributors of ephedra, one Web site was no longer operational, one no longer shipped ephedra-containing products to US customers, and 6 continued to sell the products to US consumers. Therefore, 47% of Web sites continued to market ephedra products after the ban.<sup>10,11</sup>

Discussion

After this study was completed, the FDA released a warning to consumers not to purchase or consume DS products that claimed to be "safe legal highs" or that were being marketed as "street drug alternatives." The warning stated that DS products promoted as such were considered to be misbranded and qualified as unapproved new drugs. They recognized the potential for misuse and abuse and identified this market as a potential public health concern.<sup>10,11</sup> Our findings substantiate this concern.

WEB SITE SUMMARY

As the study was under development, we expected that a large number of Web sites would be promoting DS for recreational use; however, only 28 unique sites were identified. We had anticipated finding more, given the popularity of the Internet and DS. The large number of sites outside the US may be reflective of the popularity of herbal DS in Europe. It is unclear where Americans would preferentially buy their products from US manufacturers, but a foreign site might be preferred if it is perceived to be more discreet.

Our overall kappa score for the presence or absence of information relating to DSHEA was 0.48. This represents a moderate level of agreement and the difficulty in interpreting and assessing compliance with DSHEA.

PRODUCTS AND INGREDIENTS

Many of the product names seemed to coincide with the concept of producing a blissful or fantasy-like state (eg, Bliss Extra, EX-1, Druids Fantasy, Trip2Night). The pharmacology of commonly encountered ingredients also coincides with the potential for central nervous systems (CNS) alteration. Specifically, *S. divinorum* is a type of sage that results in psychedelic effects when smoked.<sup>13</sup> Kava kava has sedative and anxiolytic properties, while guarana contains 2.5–7% caffeine and acts as a CNS stimulant.<sup>13</sup> *A. calamus* contains asarone, which is converted to trimethoxyamphetamine in the body, a psychedelic compound and the basic building block of amphetamines.<sup>14</sup> Damiana and lettuce opium are both smokeable herbs with relaxing effects.<sup>13</sup> Bioperine is an extract of the black pepper fruit and has been shown to significantly increase the bioavailability of some nutrients.<sup>15</sup> Lastly, Fo-ti may enhance mental clarity, *A. nervosa* may have hallucinogenic properties, and  $\gamma$ -aminobutyric acid may relieve anxiety and elevate mood.<sup>13,16</sup>

EFFECT CLAIMS

Products were most often likened to marijuana, which was not surprising given the results of the NSDUH.<sup>1</sup> On the other hand, product effect claims most commonly fell into the hallucinogen category, which did not coincide with the NSDUH survey, where stimulant use exceeded that of hallucinogens.<sup>1</sup>

ADVERSE EFFECTS, CONTRAINDICATIONS, AND DRUG INTERACTIONS

The Salvia scale was included as part of these results because we were alarmed by the "loss of consciousness" described in level 6 and by the recommendation that a "sitter" may be necessary. Given these 2 claims, it is clear that this herb has a serious potential for harm. It also raises concerns if it is taken with other CNS-acting agents that affect consciousness or respiration.

More than half of the Web sites evaluated stated an adverse effect, with impaired motor coordination being the most common. Given that these products were being recommended for the purpose of altering mood, perception, or behavior, this disclaimer seems warranted. Other common adverse effects, such as nervousness, insomnia, and increased heart rate, coincided with the stimulant nature of ephedra and caffeine, which were frequently present in these products. Of course, with any ephedra product, the greatest concern remains its ability to produce myocardial infarction, stroke, or death, which was the impetus behind the FDA ban.<sup>10,11</sup>

Kava was a commonly encountered ingredient. Healthcare providers should be aware that this herb has been associated with cases of liver toxicity and failure, leading to a ban on its sale in several countries.<sup>17</sup> Altered mental sta-

Table 3. SALVIA Scale<sup>12</sup>

Level	Effect
1	Subtle effects, such as relaxation and increased sensual appreciation
2	Altered perception, such as more pronounced colors and textures; thinking becomes less logical and more playful; may be short-term memory loss
3	Light visionary state, such as closed-eye visuals
4	Vivid visionary state, such as complex 3-dimensional realistic scenes appearing; shamanistic journeying to other lands; "dream time"
5	Immaterial existence, in which one is no longer aware of having a body and identity is lost
6	Anesthesia, in which consciousness is lost for several minutes

CE Dennehy et al.

tus and ataxia have also been observed in cases of acute kava ingestion.<sup>18</sup>

#### LIMITATIONS

All of the Web site coding was performed within a 2-month time period, but site changes occurred during this time that may have affected investigator coding. Our overall kappa scores, however, were good to excellent in most areas (>0.7), suggesting that these differences were minor.

Our method of defining search terms was somewhat random. The terms we eventually decided upon may not have been optimal and could have led us to identify fewer Web sites than actually exist. Researchers interested in duplicating this type of study may wish to include other search terms, such as those described by the FDA in their warning to consumers about these products (ie, "safe legal highs," street drug alternatives).

Finally, we never attempted to purchase any DS products. As a result, it is difficult to verify whether all of these sites would actually ship products to US consumers, even though all sites stated that they would.

#### COMPLIANCE WITH EPHEDRA BAN

The majority of US Web sites were in compliance with the ephedra ban, whereas only 25% of foreign distributors were. This is not surprising, as the ban was issued by the FDA and was limited to products being sold within the US or to US residents. Given the large number of ephedra-based products that we identified, this legislation is likely to have a positive effect on this market.

It is apparent that the FDA is continuing to conduct surveillance of DS products that may pose a risk to con-

sumers. In February 2004, they issued a release not to purchase an herbal Ecstasy product known as Green Hornet due to case reports of seizures, tachycardia, and hypertension.<sup>19,20</sup> Although our study did not identify this product, it does fall within the category of DS marketed for recreational use.

#### Conclusions

The findings from this study indicate that herbal DS are being marketed for recreational purposes and as alternatives to illicit drugs. Most of the products were likened to marijuana or Ecstasy, and most claimed to have hallucinogenic or stimulating properties. Products containing ephedra and *S. divinorum* were the most commonly encountered. Even after the FDA ban on the distribution of ephedra-containing DS in the US, we were able to identify a number of sites that continued to sell them. Healthcare professionals should be familiar with these products so that they are better able to identify products, ingredients, and causes of toxicity in persons utilizing DS for recreational purposes.

#### EXTRACTO

**TRASFONDO:** La red de informática Internet es una herramienta popular de mercadeo y venta de suplementos nutricionales. Varios sitios de la red Web venden estos productos para uso puramente recreativo.

**OBJETIVO:** El objetivo de este estudio es describir el contenido de los sitios de la red Web que anuncian y mercadean suplementos botánicos para uso recreativo, específicamente con el propósito de alterar el estado de ánimo (alegría, relajamiento o euforia), el comportamiento, la percepción, o como un sustituto de una droga de abuso.

**MÉTODOS:** Se utilizaron 4 motores de búsqueda con los términos "comprar euforia/nota/arrebato herbal" y "comprar euforia/nota/arrebato legal" para identificar los sitios de la red Web vendiendo los suplementos de uso recreativo. Los sitios de la red se evaluaron para determinar su país de origen y el cumplimiento con la Ley de Salud y Educación de Suplementos Nutricionales, conocido por sus siglas en inglés DSHEA. Se evaluaron los productos para determinar si tenían lista de ingredientes, reclamo de efecto, comparación a drogas ilícitas, efectos adversos, y contraindicaciones.

**RESULTADOS:** Se evaluaron 28 sitios de la red con 119 productos. La mayoría de los sitios se encontraban en los Estados Unidos de América

#### Evaluation of Herbal Dietary Supplements Marketed for Recreational Use

del Norte (54%) y estaban en cumplimiento con el DSHEA. Cuarenta y siete por ciento de los productos se compararon con drogas ilícitas, típicamente marihuana (48%) o éxtasis (23%). Los ingredientes más comunes hallados en los productos fueron alcaloides de efedra (27%), *Salvia divinorum* (17%), kava (10%), guarana (10%), *Acorus calamus* (10%) y damiana (10%). El reclamo de efectos frecuentemente involucraba productos con acción alucinógena (51%) o estimulante (39%). Un 64% de los sitios mencionaron efectos adversos y 54% mencionaron interacciones a con medicamentos.

**CONCLUSIONES:** Este estudio demostró que algunos suplementos nutricionales botánicos se están mercadeando como alternativas legales para sustancias ilícitas de abuso. Los profesionales de la salud deben conocer esta tendencia y los productos que están involucrados.

Jorge R Miranda Massari

#### RÉSUMÉ

**OBJECTIF:** L'objectif de cette étude est de décrire le contenu des sites internet qui annoncent et vendent des suppléments diététiques pour usage récréatif.

**MÉTHODES:** Quatre moteurs de recherche et les mots clés suivants "buy herbal high" et "buy legal high" ont été utilisés afin d'identifier les sites internet qui vendent ces produits. Les sites internet ont été évalués selon leurs pays d'origine et la conformité avec le "Dietary Supplement Health and Education Act (DSHEA)." Les éléments suivants ont été évalués: la liste des ingrédients, les effets annoncés, la comparaison avec les drogues illicites, les effets indésirables, les interactions médicamenteuses, et les contre indications.

**RÉSULTATS:** Un nombre de 28 sites internet avec 119 produits ont été évalués. La majorité de sites était retrouvé aux États-Unis (54%) et étaient conformes avec le DSHEA. Quarante-sept pour cent des produits étaient associés à des drogues illicites, typiquement la marijuana (48%) ou l'éctasie (23%). Les ingrédients les plus souvent retrouvés étaient l'éphédra (27%), la *Salvia divinorum* (17%), le kava (10%), le guarana (10%), l'*Acorus calamus* (10%), et le damiana (10%). Les effets annoncés impliquaient souvent les produits utilisés comme hallucinogènes (51%) ou stimulants (39%). Soixante-quatre pour cent des sites décrivaient les effets indésirables et 54% les interactions médicamenteuses.

**CONCLUSIONS:** Cette étude démontre que les suppléments diététiques sont utilisés comme alternative aux drogues illicites. Les professionnels de la santé doivent être au courant de cette tendance et connaître les produits impliqués.

DRAFT V.4

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that their ready availability poses a risk to the health and safety of Canadians. particularly youth

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some individual American states have also implemented laws restricting its use, sale and/or distribution.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any such legitimate uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA, as required.

Need for stronger statements as to risk; include evidence

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette*, Part I.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

Notice to interested parties - Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15 year olds have used *Salvia divinorum* in the past year. Health Canada is concerned about the potential abuse and unknown effects of these substances. As *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that their ready availability poses a risk to the health and safety of Canadians, particularly youth.

DRAFT V.6

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

Notice to interested parties - Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, the known effects are thought to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs. Moreover, results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15 year olds have used *S. divinorum* in the past year. ~~Health Canada is troubled by the potential abuse and unknown effects of these substances.~~

Given their pharmacological similarity to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* and salvinorin A pose a risk to the health and safety of Canadians, particularly youth.

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting its use, sale and/or distribution.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The control of *S. divinorum* and salvinorin A under the CDSA will

**DRAFT V.7**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as LSD and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The control of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette, Part I*.

Hi Jocelyn,

Below are revised version of the MLs and NOI as per your comments.

Based on your comments on the MLs, note that we have removed all specific references to Schedule III.

Also, for the title of the NOI, we have kept "Controlled Drugs and Substances Act" non-italicized to differentiate it from the rest of the title which is italicized.

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

Deleted: Since 2006, Health Canada has noted

Deleted: .

Deleted: Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given

Deleted: .

#### Key Messages:

- Health Canada is proposing that *Salvia divinorum* and salvinorin A be regulated as controlled substances under the *Controlled Drugs and Substances Act* (CDSA). The inclusion of *Salvia divinorum* and salvinorin A in the Schedules to the CDSA will mitigate the risks associated with their ready availability and potential abuse.
- Health Canada intends to inform stakeholders of its decision via the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *Salvia divinorum* nor salvinorin A are listed under the *United Nations Drug Control Conventions* and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

Questions and Answers:

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Formatted: Bullets and Numbering

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

Deleted: 1

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

Deleted: 1  
 Deleted: Because  
 Deleted: n

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

Deleted: Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*. ¶

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When *S. divinorum* and salvinorin A are included in the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

Formatted: Font: Italic  
 Deleted: 2  
 Deleted: 2

one of

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

Deleted: 3

A4 – Once *S. divinorum* and salvinorin A are included in the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Deleted: 3

Formatted: Font: Not Bold

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Deleted: alvia

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

Deleted: Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:  
<#>International requirements and trends in international control;  
<#>Chemical and pharmacological similarity to other substances already regulated under the CDSA;  
<#>Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);  
<#>Potential for abuse and risk of addiction associated with the substance;  
<#>Extent of actual abuse of the substance in Canada and internationally; and  
<#>Overall risk to public health and safety posed by the substance.

A - Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

A5 – See A4

Deleted: 6

Deleted: 6

Deleted: substance

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

DRAFT 14  
December 9, 2010

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act (CDSA)*.

#### Key Messages:

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with their ready availability and potential abuse.
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

***Salvia divinorum as a controlled substance:***

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).

Overall focus: we need to crystallize why we are scheduling: → abuse potential → increasing use → unknown effects

Need for stronger rationale for NOZ

DRAFT 14  
December 9, 2010

~~NOZ~~

**Media Lines**  
**Salvia divinorum**

**Issue**

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

X# number of kids using it

HC concerned about increased use... see CADUMS

**Key Messages:**

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with their ready availability and potential abuse.
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

~~NOZ~~

**Supplementary Messages:**

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

Def. of NHP

Currently, salvia and salvinorin are captured as NHP as it is not about and ~~not~~ alters brain functions. This... 001847

- The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Questions and Answers:**

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Why are we scheduling? Potential for abuse given increasing use.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *S. divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

→ by scheduling, it will become illegal / could eliminate perception that it is not

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Jocelyn,

I have updated the Media Lines for Salvia as requested. However, I haven't been able to get in touch with Nicole Prentice today with regards to having Cathy approve the MLs and NOI together. I'll let you know once I hear back from her.

Hi Stephanie,

As promised, here are the MLs with a few changes from Christine and a question for policy to answer. If you have any questions, please let us know.

When you send to CSTD DGO for approval, can you please cc Christine Roush and myself on the email. Once Cathy approves, we can discuss the next steps in the approval process (as discussed earlier, the media lines have about 10 more approvals after Cathy).

Thanks!  
Nicole

Hi Nicole,

Here are the revised Salvia Media Lines, approved by the Director, OCS.  
[attachment "Salvia Media Lines\_Dec 8.doc" deleted by Nicole Prentice/HC-SC/GC/CA]

As we discussed this morning, it would be appreciated if your group could review and approve the MLs and then return them to OCS. We will then forward them to the CSTD DGO for approval along with the Salvia NOI so that these documents can be reviewed by Cathy together.

DRAFT 14  
December 8, 2010

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

#### Key Messages:

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the risks associated with their ready availability and potential abuse. (Message is unclear – reduce what risks (to health, security, i.e., enforcement).
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### Questions and Answers:

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Formatted: Bullets and Numbering

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

Deleted: 1

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

Deleted: 1  
Deleted: Because  
Deleted: n

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

Deleted: Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*. ¶  
Formatted: Font: Italic  
Deleted: 2  
Deleted: 2

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

Deleted: 3

A4 – Once *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Deleted: 3

Formatted: Font: Not Bold

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Deleted: alvia

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Deleted: Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:  
<#>International requirements and trends in international control;  
<#>Chemical and pharmacological similarity to other substances already regulated under the CDSA;  
<#>Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);  
<#>Potential for abuse and risk of addiction associated with the substance;  
<#>Extent of actual abuse of the substance in Canada and internationally; and  
<#>Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?

A5 – See A4

**Media Lines**  
***Salvia divinorum***

**Issue**

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

*regulated for the health & safety of Canadians, particularly youth*

**Key Messages:**

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with their ready availability and potential abuse.
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

*following activities will be illegal*

*currently law enforcement can't ...*

**Supplementary Messages:**

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

*why are we regulating/ sched*

Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

*Q&A*

- The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

Q&A

**Questions and Answers:**

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *S. divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

|| what did we determine abuse? \* potential for abuse?

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *S. divinorum* and salvinin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article for the departmental web site about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: on

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
  - 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year;
- and.

- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**Re: Updated Media Lines and Draft Notice of Intent for Salvia** 

Stephanie Szick to: Jocelyn Kula

2010-12-10 08:01 AM

Cc: "Denis Arsenault", "Stephanie Chandler"

ha, ha...my I figured as much but like to ask to be sure!  
I see Cathy is to sign off yes, but I expect others up the line will at  
least want to see it before it goes to CG1....and yes, for the Outlook  
table but once we have a sense of timing.

Subject: Re: Updated Media Lines and Draft Notice of Intent for  
Salvia

NOI gets published in CG I (weren't you just at the PPR on scheduling  
process?! Lol) and yes, DG sign off is typical. If it needs higher  
approval, that's fine (and yes we would put in docket and do 3 month  
report etc) but we need to know if that is required. In any case, don't  
see that anyone other than Cathy's name would be on it.

Thanks Jocelyn

Will have a look this morning and pass on to Cathy for her approval.

Please refresh my memory -- the NOI is posted publicly where? I expect  
this will need to go up the line given the subject matter -- is this the  
standard process however -- i.e. beyond DG approval for the NOI to be  
posted?

Subject: Updated Media Lines and Draft Notice of Intent for Salvia

Hi Stephanie,

Per previous instruction from Cathy and for Cathy's review and approval, please find attached a copy of the revised media lines for Salvia as well as our proposed Notice of Intent. We have worked with Comms on the media lines, and they are comfortable with us submitting them for Cathy's approval ourselves as we know that Cathy wanted to see both the media lines and the draft NOI at the same time. For this reason, we are not submitting the IYH for approval at this point; our thinking is that we would hold off on issuing that until the NOI was in print. We have already revised the text to be consistent however.

DRAFT 14  
December 9, 2010

### Media Lines *Salvia divinorum*

#### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

#### Key Messages:

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with their ready availability and potential abuse.
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

#### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Questions and Answers:**

**Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

**Formatted:** Bullets and Numbering

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

**Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

**Deleted:** 1

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Deleted:** 1  
**Deleted:** Because  
**Deleted:** n

**Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *S. divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

**Deleted:** Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether it should be regulated under the *Controlled Drugs and Substances Act*. ¶

***Salvia divinorum as a controlled substance:***

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).

**DRAFT V.4**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvininorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide preliminary comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvininorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA), and to identify themselves for inclusion in any future consultation.

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvininorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As *S. divinorum* and salvininorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that their ready availability poses a risk to the health and safety of Canadians.

While these substances are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvininorin A. Some individual American states have also implemented laws restricting its use, sale and/or distribution.

Placing these substances within Schedule III to the CDSA would prohibit the following activities with these substances unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvininorin A for a legitimate medical, scientific or industrial purpose, Health Canada is seeking information from stakeholders on whether there are any such legitimate uses for these aforementioned substances in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA, as required.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments following prepublication of the scheduling proposal in *Canada Gazette*, Part I.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

### **Media Lines** ***Salvia divinorum***

#### **Issue**

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be included in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA).

#### **Key Messages:**

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the CDSA.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with their ready availability and potential abuse.
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

#### **Supplementary Messages:**

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.
- Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

- The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### Questions and Answers:

#### **Q1 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA.

#### **Q2 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A2 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

#### **Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A3 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *S. divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation.

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

#### ABSTRACT

Salvinorin A is a potent, selective nonnitrogenous kappa opioid agonist and the known psychoactive constituent of *Salvia divinorum*, a member of the mint family that has been used for centuries by Mazatec shamans of Mexico for divination and spiritual healing. *S. divinorum* has over the last several years gained increased popularity as a recreational drug. This is a double-blind, placebo controlled study of salvinorin A in 4 psychologically and physically healthy hallucinogen-using adults. Across sessions, participants inhaled 16 ascending doses of salvinorin A and 4 intermixed placebo doses under comfortable and supportive conditions. Doses ranged from 0.375 µg/kg to 21 µg/kg. Subject-rated drug strength was assessed every 2 min for 60 min after inhalation. Orderly time- and dose-related effects were observed. Drug strength ratings peaked at 2 min (first time point) and definite subjective effects were no longer present at approximately 20 min after inhalation. Dose-related increases were observed on questionnaire measures of mystical-type experience (Mysticism Scale) and subjective effects associated with classic serotonergic (5-HT<sub>2A</sub>) hallucinogens (Hallucinogen Rating Scale). Salvinorin A did not significantly increase heart rate or blood pressure. Participant narratives indicated intense experiences characterized by disruptions in vestibular and interoceptive signals (e.g., change in spatial orientation, pressure on the body) and unusual and sometimes recurring themes across sessions such as revisiting childhood memories, cartoon-like imagery, and contact with entities. Under these prepared and supportive conditions, salvinorin A occasioned a unique profile of subjective effects having similarities to classic hallucinogens, including mystical-type effects.

#### 1. Introduction

Shamans of the Mazatec people of Oaxaca, Mexico have used *Salvia divinorum*, a member of the mint family, for at least centuries in ethnomedical practices including divination and spiritual healing (Valdes, 1994; Ott, 1995, 1996; Siebert, 1994). *S. divinorum* contains the known psychoactive constituent salvinorin A, which is a neoclerodane diterpene and a potent nonnitrogenous kappa opioid agonist with no activity at the 5-HT<sub>2A</sub> serotonin receptor, the principal site of activity of classic hallucinogens such as LSD, psilocybin, dimethyltryptamine, and mescaline (Roth et al., 2002; Prisinzano, 2005). Studies in monkeys show salvinorin A produces discriminative stimulus effects similar to other high efficacy kappa agonists (Butelman et al., 2004). A kappa-like profile of antinociceptive and behavioral effects has also been demonstrated in rodents

(Fantegrossi et al., 2005; Wang et al., 2005; Zhang et al., 2005; McCurdy et al., 2006; Carlezon et al., 2006). Nonhuman research with salvinorin A has shown mixed results regarding abuse potential. Evidence suggestive of no or low abuse potential includes research showing salvinorin A to elevate thresholds for intracranial stimulation and decrease extracellular dopamine concentrations in the nucleus accumbens in rats (Carlezon et al., 2006), and produce conditioned place aversion in mice (Zhang et al., 2005). Evidence suggestive of abuse potential are recent findings demonstrating intracerebroventricular salvinorin A self-administration and conditioned place preference in mice at relatively low doses (Braidia et al., 2008).

Although the ethnomedical use of *S. divinorum* by shamans dates back at least for hundreds of years, an understanding of the psychoactive effects of salvinorin A by American and European drug users dates back only about 15 years (Siebert, 1994; Ott, 1995). In traditional Mexican use, the leaves of *S. divinorum* are chewed or made into an infusion and swallowed (Valdes, 1994; Siebert, 1994; Ott, 1995). Outside the Mazatec, drug users typically inhale the drug

E-mail address: [mwj@jhu.edu](mailto:mwj@jhu.edu) (M.W. Johnson).

via smoking or, less frequently, via volatilization, although buccal administration also occurs (Baggott et al., 2004; González et al., 2006). Internet vendors and “head shops” sell *S. divinorum* plants, dried leaves, leaf extracts with increased salvinorin A concentrations (for smoking), and tinctures (for buccal administration). As of 2006 at least 1.8 million people age 12 or older have used the drug in the United States (Office of Applied Studies, 2007), and the prevalence is likely higher now. Survey research suggests that effects are brief and that users claim positive after-effects such as increased insight and improved mood (Baggott et al., 2010). One study found high scores on a measure of state anxiety when asking participants to retrospectively evaluate their last use (González et al., 2006). During a recent 10-year period, the California Poison Control System received 37 telephone calls concerning *S. divinorum* exposures with reported neurologic, cardiovascular, and gastrointestinal effects (Vohra et al., 2009). Three cases reported that *S. divinorum* use was associated with an extended psychotic-type reaction, although concurrent other drug use (Singh, 2007), suspected schizophrenic predisposition (Przekop and Lee, 2009), and injuries secondary to medical treatment (Paulzen and Gründer, 2008) have complicated interpretation of these cases. Possession or use of *S. divinorum* is currently illegal in 13 nations and 15 states within the United States, and additional nations and states have implemented lesser forms of control.

Given the wide availability, continued popular use, and legal controversy, information is needed regarding the human psychopharmacology of salvinorin A. In addition to providing information about this novel drug, studying the effects salvinorin A may assist in identifying new opioid receptor modulators that may have therapeutic applications in certain psychiatric disorders (e.g., Alzheimer's disease, schizophrenia, bipolar disorder, cocaine abuse) and in the treatment of pain (Mello and Negus, 2000; Sheffler and Roth, 2003; Kivell and Prisinzano, 2010). This is a report of preliminary findings of basic physiological, behavioral and subjective effects of inhaled salvinorin A across a range of doses, from sub-threshold to high, delivered under comfortable and interpersonally supportive conditions to healthy participants who reported histories of hallucinogen use.

## 2. Methods

### 2.1. Participants

Participants were recruited from the Baltimore, MD area through flyers and ads in local newspapers. After a phone screen confirmed basic inclusion criteria (age, high-school-level education, and prior hallucinogen use), volunteers came to the laboratory for in-person screening. A social worker (who was trained by psychometricians and had a psychiatrist and clinical psychologist available for consultation) conducted a structured clinical interview to exclude individuals with a current or past history of meeting DSM-IV criteria for schizophrenia; psychotic disorder (unless substance-induced or due to a medical condition); bipolar I or II disorder; alcohol or drug dependence (excluding caffeine and nicotine) for the last 5 years; severe major depression; dissociative disorder; and other psychiatric conditions judged to be incompatible with establishment of rapport or safe exposure to hallucinogens. Participants were excluded who reported having a first or second degree relative with schizophrenia, psychotic disorder (unless substance induced or due to a medical condition), or bipolar I or II disorder. Medical evaluation included a physical exam conducted by a nurse practitioner, an ECG evaluated by a physician, and a physician evaluation of blood sample analyses that included a complete blood count with differential and a chemistry panel including electrolytes, glucose, urea, creatinine, uric acid, liver profile, total cholesterol, and triglycerides. Additional screening visits assessed general motivation for participation and established trust and rapport with the study staff. Participants agreed to refrain from using *S. divinorum* or illicit drugs during the course of the study.

Four participants ( $M = 29.5$  years old, range = 23–35 years old; 2 females) passed screening and completed all drug sessions and data collection (Note: one additional individual participated in pilot sessions to develop and refine the inhalation procedure; these data are not included in the reported analyses). Participant bodyweights were 58.5, 74.6, 64.4, and 67.1 kg for the two males and two females, respectively. Participants had at least a high-school level of education ( $M = 15$  years, range = 14–16 years) and reported using *S. divinorum* at least once in the past five years ( $M = 16$  uses, range = 2–40 uses). Participants were compensated \$50 per session (plus a

bonus of \$50 per session upon completion of data collection). Participations were also motivated by their reported interest in spirituality and/or altered states of consciousness. Transportation to and from the study site (via taxi) was provided for all participants. The Institutional Review Board of the Johns Hopkins University School of Medicine approved the study, and all participants gave their informed consent before participation.

### 2.2. Drug preparation and delivery device

Salvinorin A was isolated from *S. divinorum* leaves and shown to be 99.5% pure by HPLC. Because weighing the very small doses of salvinorin A required for this study is difficult, a larger quantity was weighed on an analytical balance and then dissolved in a measured volume of HPLC grade acetone. After filtering through a sterilized, acetone-approved 0.2  $\mu\text{m}$  filter (Millex-LG Filter Unit, Millipore Corporation, Billerica, MA), 1 ml of solution was placed into a 5 ml round bottom chemistry flask and allowed to evaporate, leaving the dose of salvinorin A as a residue on the interior surface of the flask. Before the session, the flask was attached to the bottom of a chemistry vacuum adapter by ground glass tapered joint and secured by a metal Keck clip. A vinyl tube (23 cm long, 6.35 mm inside diameter) was connected to the vacuum line of the adapter for inhalation. The tubing was replaced between participants but was not replaced for different sessions for the same participant. The resulting “pipe” was held stable by a ring stand clamp during administration, and the tube extended through a hole in a room divider toward the participant's sitting area.

### 2.3. Drug administration

Sixteen doses of salvinorin A were administered in an ascending order. Although it is unknown whether salvinorin A effects are bodyweight dependent, doses in this study were adjusted for participant bodyweight based on knowledge that some but not all psychoactive drug effects are bodyweight dependent. The lowest dose in the sequence was 0.375  $\mu\text{g}/\text{kg}$  of bodyweight and subsequent doses were 0.75  $\mu\text{g}/\text{kg}$ , 1.5  $\mu\text{g}/\text{kg}$ , and thereafter increased by an increment of 1.5  $\mu\text{g}/\text{kg}$  until the maximum dose of 21  $\mu\text{g}/\text{kg}$  was reached. Four placebo doses were inserted in the ascending sequence of salvinorin A doses such that each consecutive block of 5 sessions included 1 placebo. The position of the single placebo within each block of 5 sessions was determined randomly for each volunteer. Participants were told that on any session they may receive a dose of salvinorin A or placebo but were not told about the ascending design or frequency of placebos.

For each session the round-bottom flask was heated from underneath with a butane microtorch with approximate flame temperature of 1700 °C (model ST200T, Bernzomatic, Huntersville, NC). Although the boiling point and combustion temperature of salvinorin A have not been empirically determined, the flame temperature was assumed to be sufficient to heat the salvinorin A on the interior of the flask to its boiling point during the decreased air pressure created by inhalation, without substantial combustion of salvinorin A. The microtorch was adjusted so that the flame was approximately 1.5 cm in length, and the tip of the flame was held in contact with the round-bottom flask. Using these procedures, inhalation of unvolatilized drug was unlikely because the salvinorin A residue left upon evaporation of acetone appeared strongly attached to the interior of the flask, and in tests with various rates of mechanical airflow (simulated inhalation) without heat, salvinorin A was observed to remain undisturbed. Tests with mechanical airflow and the application of the microtorch showed the method to result in the volatilization of salvinorin A with little scorching (small black marks presumably resulting from combustion). Seated in a comfortable reclining lounger, the participant inhaled slowly for 40 s while the flask was heated, followed by a verbally cued exhale. For placebo sessions, the same protocol was followed but no salvinorin A was in the flask. The unblinded session monitor who heated the flask was obscured from the participant's view (behind the divider), while the blinded staff member collected drug-strength ratings and all other pre- and post-session data from the participant.

### 2.4. Drug sessions

Each participant completed 20 sessions across several weeks (range = 8–14 weeks). Participants typically completed 1–3 sessions per week with consecutive sessions separated by at least 1 day (range = 1 day to 4.5 weeks).

Each meeting at the study site lasted approximately 2.5 h. Upon arrival, participants provided an expired air sample that was required to indicate a blood alcohol concentration of 0.00% for the session to continue (Alco-Sensor IV, Intoximeters, Inc., Saint Louis, MO). In addition, abstinence from opioids, cocaine, and benzodiazepines was confirmed by urine test before each session (model MUI-PM, Medimpex United Inc., Bensalem, PA). This urine test panel was selected because it can detect opioids such as oxycodone and buprenorphine with kappa opioid effects. Abstinence from hallucinogens (and other drugs not listed above) was not biologically confirmed. However, participants consented to have their urine tested for “various drugs” and were not informed about which drugs were included in the urine test. Female participants were required to provide a negative urine pregnancy test before each session (model HCG-001, Medimpex United Inc., Bensalem, PA). Also before drug administration, participants briefly reviewed experiences from the last session with the study staff. During drug administration, participants were seated in a comfortable

semi-upright or reclined position and wore eyeshades for 3–5 min before and for 10–30 min after drug administration. A relaxing instrumental music track (Steven Halpern, "Awakening", Music for Sound Healing, Inner Peace Music, 1999) was played throughout the session as a continuous loop. Approximately 1 h after drug administration participants completed several questionnaires and computer-based assessments (duration = 45–60 min).

## 2.5. Measures

**2.5.1. Physiology.** Blood pressure (systolic and diastolic using oscillometric method with the blood pressure cuff placed on the arm) and heart rate were monitored using a Non-Invasive Patient Monitor Model 507E (Criticare Systems, Waukesha, WI). Data were collected at baseline (for at least 5 min before drug administration) and every 2 min during the 60 min following drug administration.

**2.5.2. Time course.** Participants indicated overall drug strength using an 11-point scale (0 = definitely no effect; 1 or 2 = possible salvinorin A effects; 3–10 = definite salvinorin A effects with 10 representing "the strongest effect imaginable for salvinorin A"). Participants were verbally cued to provide a rating of drug strength at baseline and every 2 min for 60 min after drug administration. In the case of missing reports (i.e., participant unresponsive during the first few minutes of drug effects), the value of '10' was imputed.

**2.5.3. Safety and tolerability.** Although not reported by users in retrospective analyses (Baggott et al., 2010; González et al., 2006), tremor has been observed in rhesus monkeys at a substantially higher dose (100 µg/kg) than our maximum dose (Butelman, personal communication, 2006). The Fahn–Tolosa–Marin Tremor Rating Scale (TRS; Fahn et al., 1993) was used to classify resting and kinetic tremor severity on a 5-point scale. At baseline and at 15 and 30 min after drug administration, the study staff visually assessed kinetic tremor intensity as the participant bent both of his or her extended arms to touch middle finger to nose. Study staff also rated the magnitude of resting tremor during the time interval leading up to the assessments of kinetic tremor (i.e., 0–15 min, 15–30 min) by closely observing the participant.

To assess psychological effects that might warrant discontinuing future sessions, participants were asked at the end of each session "Would you absolutely refuse to receive the same or higher dose of today's drug in future sessions?" A "no" response was required to continue. In addition, study staff interviewed the participant before and after each session to determine how s/he felt about continuing to participate.

**2.5.4. End-of-session subject-rated effects.** Shortly after the 60-min time point, participants were asked to retrospectively rate the strength of the peak drug effect during the session using the same 11-point scale used to assess the time course of drug effects. Because kappa opioid agonists, including salvinorin A, have been reported to induce dysphoric effects (Walsh et al., 2001; González et al., 2006), participants were asked to complete retrospective ratings of "drug liking" and "drug disliking" (2 questions; 0 = neutral or no effect, 1 = like/dislike but not very much, 2 = like/dislike somewhat, 3 = like/dislike quite a bit, 4 = like/dislike very much), and "good effects" and "bad effects" (2 questions; 0 = no good/bad effects at all, 1 = a little, 2 = moderately, 3 = quite a bit, 4 = very much).

Consistent with case reports and survey studies of *S. divinorum* users (Siebert, 1994; Baggott et al., 2010; Bücheler et al., 2005; González et al., 2006) we hypothesized that salvinorin A would elicit subjective effects with substantial overlap with classic hallucinogens (e.g., psilocybin, LSD). We further hypothesized that, unlike orally administered psilocybin and LSD, volatilized and inhaled salvinorin A would have a time course profile more similar to intravenous dimethyltryptamine (Strassman et al., 1994). In addition, because *S. divinorum* has been used by shamans for divination and "visionary effects" (Ott, 1995), we hypothesized that salvinorin A might elicit subject-rated mystical-type effects. We used two questionnaires to assess these effects. The Hallucinogen Rating Scale (HRS; 99 items) was designed to show sensitivity to dimethyltryptamine (Strassman et al., 1994) and has also been shown sensitive to psilocybin (Griffiths et al., 2006). It consists of six subscales assessing various aspects of hallucinogen effects: Intensity (effects related to the strength of the overall experience), Somaesthesia (interoceptive, visceral and tactile effects), Affect (emotional and affective responses), Perception (visual, auditory, gustatory, and olfactory effects), Cognition (alterations in thought processes or content), and Volition (awareness of the environment and capacity to willfully control one's body). Most items are rated on a 5-point scale (0 = not at all; 4 = extremely). The Mysticism Scale (32 items) was developed to assess primary mystical or spiritual experiences (Hood et al., 2001) and has been shown to be sensitive to the effects of psilocybin (Griffiths et al., 2006). Each item is rated on a 9-point scale (−4 = this description is extremely not true of my own experience; 0 = I cannot decide; +4 = this description is extremely true of my own experience). Approximately 1 h after drug administration, participants completed the HRS and Mysticism Scale with reference to their experiences since receiving the inhaled drug.

## 2.6. Analysis

Subject-rated drug strength ratings collected throughout the time course were used to calculate, for individual participants, area under the curve (AUC) values using

the trapezoidal rule. Repeated measures analysis of variance (ANOVA) with within-subjects factor of dose (17 dose levels including placebo) was used to examine dose-related changes in the subject-rated measures and physiology (peak heart rate and blood pressure). For each participant, drug strength ratings across the 4 placebo sessions were averaged to create a single placebo data point. Tukey's HSD tests were conducted to compare dose levels, with family-wise error rate maintained at  $\alpha = .05$ .

## 3. Results

### 3.1. Time course of acute drug effects

Orderly time- and dose-related effects were observed. Subject-rated drug strength peaked at 2 min (first time point) and then progressively decreased toward pre-inhalation levels. By 20 min after inhalation, mean ratings indicated only a "possible mild" effect (see Fig. 1A). Two participants (1 male, 1 female) provided the maximal rating of 10 at one or more time points during at least one session. Both male participants were unresponsive (scores imputed as 10) on at least one time point for at least one dose. Specifically, one was unresponsive at the 2 min time point in the 15, 16.5, 18, and 21 µg/kg conditions and the 4 min time point in the 21 µg/kg condition. The other male was unresponsive at the 2 min time point in the 18 and 19.5 µg/kg conditions.

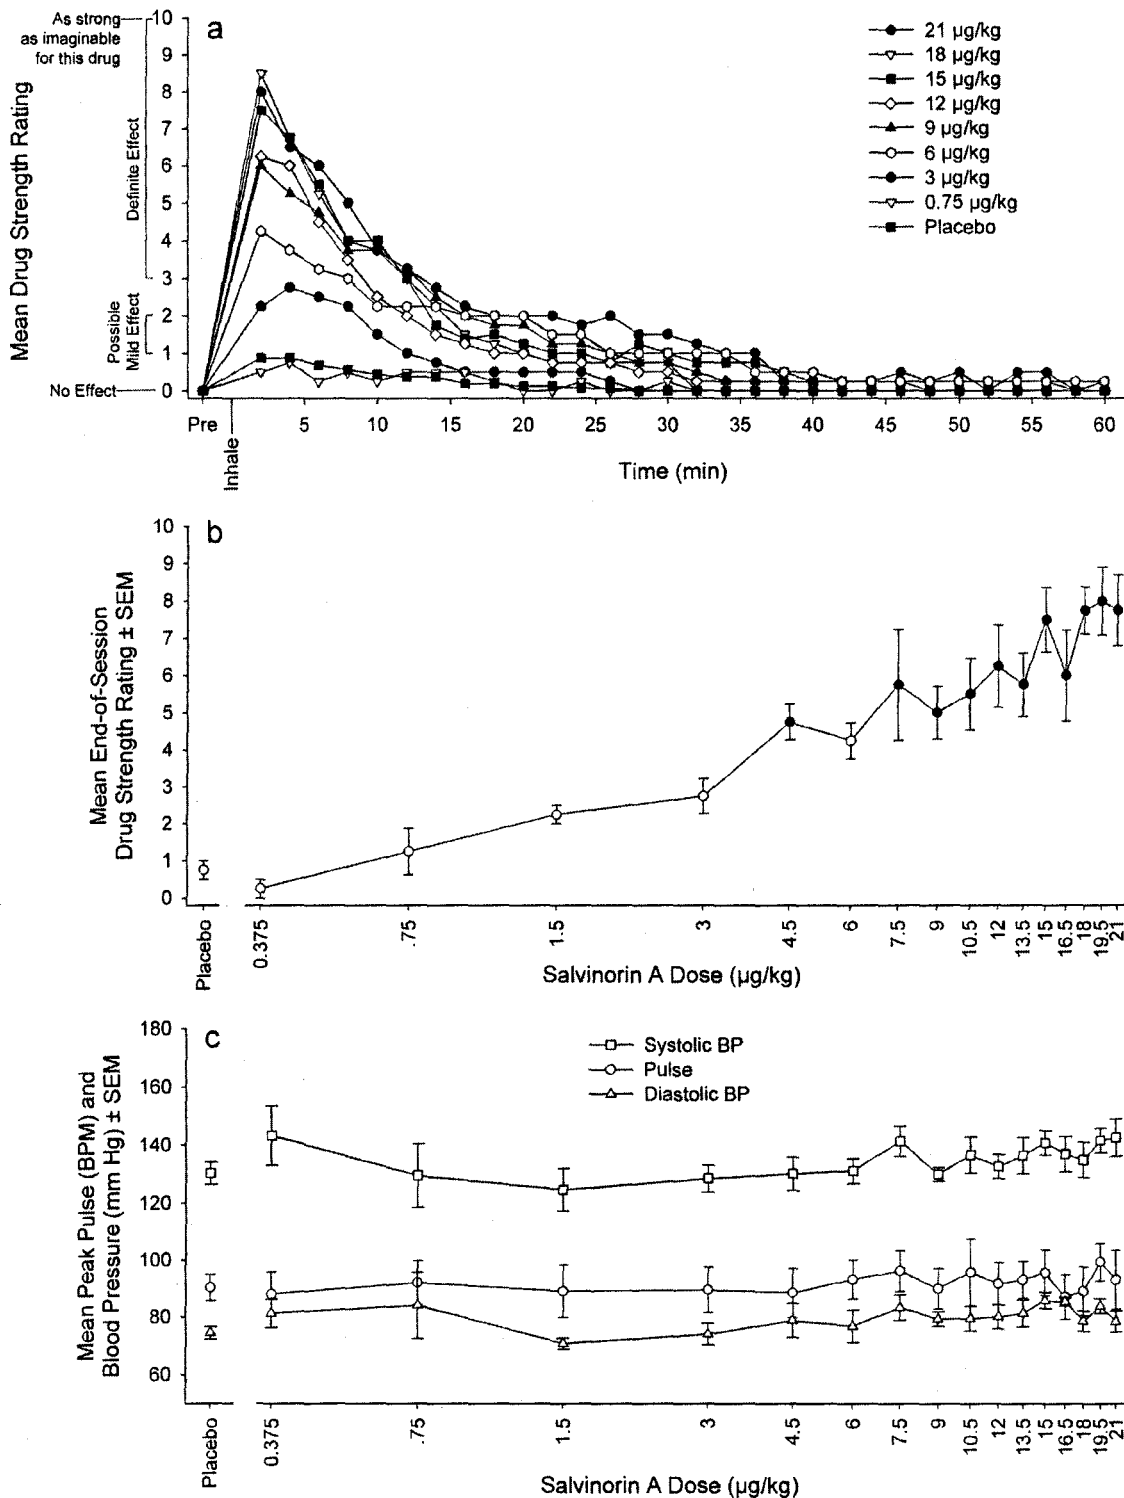

### 3.2. End-of-session retrospective self-reports

The effect of dose on peak drug strength (end-of-session rating) was significant ( $F(16,48) = 12.6, p < .001$ ), and post-hoc tests confirmed that all but one dose in the range 4.5–21 µg/kg were rated significantly stronger than placebo (see Fig. 1B). Results were similar when conducted with AUC values for drug strength ( $F(16,48) = 4.5, p < .001$ ). However, likely due to inter-participant variability in duration of drug effects, post-hoc tests showed only the highest two doses were significantly stronger than placebo. End-of-day ratings of drug liking and good effects followed a similar dose-related pattern as ratings of overall drug strength, and the effect of dose was significant for both liking ( $F(16,48) = 7.5, p < .001$ ) and good effects ( $F(16,48) = 4.4, p < .001$ ). Mean ratings of drug disliking and bad effects were low ( $M_s < 1$ ) across all sessions, and there was no significant effect of dose for either measure ( $p_s > .30$ ). Mean ratings of the highest dose indicated generally positive effects and a lack of dysphoric effects: liking  $M = 3$  (range = 2–4); good effects  $M = 2.25$  (range = 1–4); disliking  $M = .5$  (range = 0–2); and bad effects  $M = .5$  (range = 0–1), with only 1 participant indicating "disliked somewhat". There were significant effects of dose on all subscales of the HRS and on the M Scale ( $p < .05$ ) (Table 1). Post-hoc tests showed significant increases (vs. placebo) on HRS-Intensity beginning at a dose of 4.5 µg/kg, which is consistent with the pattern observed for drug strength (see Fig. 1B). The remaining HRS subscales were significantly greater than placebo only at the highest dose levels (Cognition, Affect, Somaesthesia, and Perception) or not at all (Volition). Scores on the M Scale were significantly greater than placebo at the three highest dose levels (Table 1).

### 3.3. Safety and tolerability

The effect of dose on blood pressure and heart rate were not significant ( $p > .05$ ), indicating no dose-related change in these physiological measures (see Fig. 1C). No resting or kinetic tremors were observed during any session (TRS rating = 0 for all data points). No participant refused to receive the same or higher dose at the end of any session. These results suggest that inhaled salvinorin A was physiologically safe and psychologically well tolerated across the range of doses tested.

001879

**Fig. 1.** Time- and dose-related changes in drug effects. (a) Subject-rated drug strength (reported at 2-min intervals) as a function of time (pre-drug baseline to 60 min following inhalation). Data points show mean ratings ( $N=4$ ). For graphical clarity, alternating doses in the dose sequence were deleted. (b) Subject-rated peak drug strength from the end-of-session ratings as a function of dose (logarithmic abscissa). Data points show mean ratings ( $N=4$ ); brackets show + and -1 SEM. Filled symbols indicate that the data point was significantly different from placebo (Tukey's HSD test,  $p < .05$ ). (c) Peak heart rate (beats per minute) and blood pressure (mm of Hg) as a function of dose (logarithmic abscissa). Data points show means ( $N=4$ ); brackets show + and -1 SEM.

**4. Discussion**

Consistent with results from nonhuman animal research (Mowry et al., 2003), the present results suggest a safe physiological profile for salvinorin A at the studied doses, under

controlled conditions, and in psychologically and physically healthy hallucinogen-experienced participants. Salvinorin A produced no significant changes in heart rate or blood pressure; no tremor was observed; and no adverse events were reported. Participants tolerated all doses. However, because of the small sample

**Table 1**

<sup>a</sup> All measures were administered at the end of each session (60+ min after drug administration); asterisks indicate  $p < .05$  for  $F$  values in the ANOVA (17 dose levels including placebo;  $df = 16,48$ ); bold typeface indicates significantly different than placebo in post-hoc Tukey's HSD test ( $p < .05$ ).

<sup>b</sup> Mean ratings on four placebo sessions for each of the four participants.

and the healthy, hallucinogen-experienced status of participants, conclusions regarding safety are limited.

Salvinorin A resulted in orderly dose- and time-related participant ratings of drug strength. In psychopharmacology studies with drug experienced volunteers, it is quite unusual for volunteers to report drug strength ratings as high as those observed in the present study, with 2 subjects providing ratings of 10, defined as "as strong as imaginable for this drug." The range of doses examined in this study will be useful for selecting doses for future studies using the same administration procedures (e.g., 3, 7.5, and 21 µg/kg for low, medium, and high doses, respectively). Given the increasing trend and lack of plateau in drug strength ratings (see Fig. 1B) and the lack of adverse effects in this study, future studies may also cautiously explore higher doses of salvinorin A. The relative lack of dysphoric effects ("disliking" and "bad effects") and presence of dose-related positive effects ("liking" and "good effects") contrasts with previous research with kappa agonists (Walsh et al., 2001) and *S. divinorum* (González et al., 2006) showing mainly dysphoric effects. This difference with previous research may relate to participant experience with, expectation of, and preparation for strong altered states of consciousness. In addition, salvinorin A produced dose-related increases on most subscales of the Hallucinogen Rating Scale and on the Mysticism Scale. Although limited by cross-study comparisons, high-dose hallucinogen-type effects as measured by the HRS appeared similar to those produced by intravenous dimethyltryptamine (Strassman et al., 1994) and oral psilocybin (Griffiths et al., 2006), but with qualitative differences (i.e., lower magnitude on perceptual and cognition scales). In addition, the mystical-type effects observed at the highest doses of salvinorin A appeared similar in magnitude to previous results with high-dose oral psilocybin (Griffiths et al., 2006).

The volatilization and inhalation procedures had limitations, such as a lack of quantitative temperature control, which could have possibly resulted in incomplete volatilization or combustion of salvinorin A. In addition, not replacing the tubing between sessions could have theoretically allowed for depositing and re-volatilization of salvinorin A across sessions. However, salvinorin A was observed to virtually completely volatilize with little scorching, and this outcome may be consistent with usual use because combustion also occurs in the smoking of *S. divinorum*, the most common route of use. Also, a post-hoc  $t$ -test comparing peak drug strength between the first and final placebo sessions failed to show a significant difference ( $p = .18$ ), suggesting that depositing and re-volatilization did not likely affect results. Ultimately, the orderly dose-related effects shown in Fig. 1A and B suggest reasonable precision in the administration procedures.

In the comfortable and supportive conditions of the current study (similar to those recommended for human research with classic hallucinogens; Johnson et al., 2008), salvinorin A occasioned a unique profile of subjective effects having similarities to classic hallucinogens, including mystical-type effects. Although participant narratives indicated intense, highly unusual experiences characterized by changes in spatial orientation, feelings of energy or pressure on different parts of the body, and unusual and sometimes recurring themes across sessions such as revisiting childhood memories, cartoon-like imagery and contact with entities, participants were largely behaviorally inactive. In this regard, participant experiences differed notably from some of the more chaotic effects observed in online videos of *S. divinorum* use that have gained notoriety (Lange et al., 2010). In conclusion, these results suggest the feasibility of future research examining the effects of salvinorin A, and potentially other high efficacy kappa agonists, in healthy hallucinogen-experienced participants.

### Role of the funding source

Conduct of the study was supported by National Institute on Drug Abuse (NIDA) grant R01DA003889. Support for Dr. Prisinzano was provide by NIDA grant R01DA018151.

### Contributors

Drs. Johnson and Griffiths designed the study and wrote the protocol. Drs. Johnson, MacLean, and Reissig conducted experimental sessions and collected data. Dr. Prisinzano provided expertise on the chemistry and pharmacology of salvinorin A. Drs. Johnson, MacLean, and Griffiths contributed to interpretation of results. Dr. Johnson conducted statistical analyses. Drs. Johnson and MacLean wrote the first draft of the manuscript. All authors contributed to and have approved the final manuscript.

### Conflict of interest

All authors declare that they have no conflicts of interest.

### Acknowledgment

The authors would like to thank Annie Umbricht, M.D. and the medical staff at the Behavioral Pharmacology Research Unit for medical screening and medical coverage, Janna Bonesteel, Crystal Barnhouser, Eric Richter, and Jenna Cohen for assistance in conducting sessions and collecting and organizing the data, Mary Cosimano, M.S.W., for conducting psychological screenings, and Ronald W. Wood, Ph.D. for helpful discussions on drug volatilization.

**Related Topics:** Drugs, Drugs, hallucinogen, Mental Health, mexican drugs, Mexico, regulators

17 Like 105 The hallucinogenic plant *Salvia divinorum* has been used for centuries in shamanistic ceremonies led by spiritual healers in Mexico. But now the drug has gotten so popular among recreational users in America (street names: Magic Mint, Sally D) that the government has taken notice: it's been banned in 15 states and federal legislation has been introduced to regulate the plant as a Schedule 1 drug, like marijuana, heroin and ecstasy.

According to recent surveys, users say burning and inhaling the smoke of dried *Salvia* leaves produces powerful hallucinogenic effects, and helps reduce anxiety, improve mood and increase insight. In one case, a woman with drug-resistant depression claimed significant improvements in mood after experimenting with *Salvia*. (**More on Time.com:** Does Suffering From Withdrawal Really Mean You're Addicted?)

Based on animal studies of salvinorin A, the active ingredient in the *Salvia* plant, some neuropharmacologists believe the drug may have merits beyond getting people high. It could perhaps aid in the medical treatment of serious mental conditions or chronic pain — but some scientists worry that strict federal regulation could undermine its utility.

Matthew Johnson, an instructor in the department of psychiatry and behavioral sciences at Johns Hopkins University, who recently conducted a small, new study of salvinorin A — the first involving human volunteers — testified [PDF] before Congress in 2009:

[T]his compound is completely unique, and there is good reason to think a derivative of the drug could one day provide a breakthrough medication for chronic pain, Alzheimer's disease and other forms of dementia, schizophrenia, bipolar disorder, or cocaine dependence, potentially saving thousands of lives in the long run.

But the first question is, is it safe? In their latest study [PDF], Johnson and colleagues found that it was, at least in the short term. In the experiment, two men and two women who were mentally and physically healthy and free of any drug-abuse problems were each given 16 increasingly larger doses of salvinorin A and four doses of placebo in a lab setting. The participants took the drugs in 20 sessions over two to three months. They were observed for a variety of effects, including motor function, mood, physiology and length of the drug's "high." (**More on Time.com:** What's Langa-Perfume? The Drug From Rio's Bust You've Never Heard Of)

Two of the four participants — all of whom had previously experimented with *Salvia divinorum* and other more common hallucinogens like LSD and mushrooms — reported that salvinorin A resulted in a hallucinogenic effect that was "as strong as imaginable." Researchers noted this was unusual for experienced hallucinogenic-drug users. None of the participants suffered any adverse changes in bodily functions such as blood pressure, heart rate or nerve functioning.

All participants reported that the effect of salvinorin A was markedly different from that of other hallucinogens, stating that previous experiences with LSD or mushrooms had not detached them so completely from their sense of reality. *Salvia* took them into an entirely different realm of

consciousness, they said.

"[P]articipant narratives indicated intense, highly unusual experiences characterized by changes in spatial orientation, feelings of energy or pressure on different parts of the body, and unusual and sometimes recurring themes across sessions such as revisiting childhood memories, cartoon-like imagery and contact with entities," wrote the study's authors. (More on Time.com: 'i-Dosing': Can You Download a Drug High?)

The drug's effects were immediate and lasted between 2 and 20 minutes, depending on the strength of the dose. The users reported liking the drug's effects, though only the two strongest doses used in the study were significantly different from placebo. These preliminary findings bode well for the feasibility of future research on the drug, the authors write.

February 18, 2009

Dear Senators,

I am a faculty member of Johns Hopkins University School of Medicine in the Department of Psychiatry. My specialty is conducting research on novel drugs of abuse, and understanding the nature of addiction and its treatment.

In my role in representing Johns Hopkins University School of Medicine, I wish to state that if Salvia divinorum is to be made a Schedule I drug, I support amendments which would close the legal loophole for allowing for my currently FDA-approved and Johns Hopkins Institutional Review Board-approved study to conduct human research with salvinorin A, the active constituent of Salvia divinorum. The current mechanism for exemption for Schedule I drugs in Maryland requires Federal legal exemption for research with the Schedule I drug. However, because this drug is not scheduled under Federal law, no such exemption is possible from DEA, which administers such Federal exemptions.

However, speaking beyond my role as a representative of Johns Hopkins, I, as scientist who specializes in drug abuse, addiction and its treatment, along with my research colleague Dr. Roland Griffiths, a Professor and Psychiatry and Neuroscience at Johns Hopkins School of Medicine who has been studying drug abuse for over 30 years, recognize that there is a larger issue here that is not being considered by the Senate. That is, putting the drug into Schedule I will inevitably hamper research, regardless of potential research exemptions. Some legislators have stated that research would continue as normal should a research provision be included in the Schedule I bill. Our experience in the drug abuse research field has shown us that this is a well-intentioned, yet drastic misunderstanding of modern drug development research.

For example, I can guarantee that virtually no pharmaceutical company would invest the millions of dollars, that are required for medications development, into a Schedule I drug, or its derivatives, which would also be considered as Schedule I. There is simply no commercial feasibility for a Scheduled I drug or a derivative of it.

This is alarming considering that this compound is completely unique, and there is good reason to think a derivative of the drug could one day provide a breakthrough medication for chronic pain, Alzheimer's disease and other forms of dementia, schizophrenia, bipolar disorder, or cocaine dependence, potentially saving thousands of lives in the long run. Therefore, scheduling the drug, even if our study is protected, could quite realistically prevent (or delay by decades) potential significant medical advances in the treatment of these life-threatening diseases.

Besides the pharmaceutical industry, large segments of academic research would also be prevented. For example, researchers doing rodent studies on models of Alzheimer's disease are extremely unlikely to be currently working with scheduled drugs, and will not realistically be willing or able to meet the incredibly high thresholds for gaining exemptions for scheduled drugs. Only a small minority of researchers such as myself, who study drugs of abuse have the institutional history and resources to gain these exemptions. For example, we literally have a bank vault for drug storage, 24 hour guarded security at the front desk, etc.

We would encourage legislators to read our included documents. One is a somewhat lengthy synopsis written by Dr. Griffiths and myself, of the known science about Salvia divinorum and its potential areas of danger as well as its promising role as a research tool and its potential for medications development.

However, what may be more useful to legislators is the chart we provide about the wide variety of potential ways of regulating this drug, along with examples of a wide variety of dangerous drugs and how they are regulated. In addition to this, I am providing a 1-page synopsis sheet that distills the known potential dangers of Salvia divinorum across important domains relevant to drug abuse, and compares Salvia divinorum relative to other drugs. We would encourage legislators to review the chart, along with our 1-page comparison sheet, and use these to judge the appropriate way to regulate Salvia divinorum.

We recognize the well-intentioned effort to schedule this drug into Schedule I. We believe a primary reason is the tragic death of the teen in Delaware. We understand the incredible heartache caused by his death. However, from a scientific perspective, there are over 4,000 teen suicides per year, and there is no claim or evidence that the teen was on the drug when he committed suicide. It is scientifically impossible to attribute this death to Salvia divinorum. In contrast, many teens unambiguously die every year from causes directly caused by drugs, including the abuse of solvents (very little regulation) and over the counter medicines (minimally regulated), to alcohol (moderately regulated), and to Scheduled II-V drugs such as cocaine, amphetamine, Oxycontin®, and anabolic steroids, all of which are Scheduled lower than Schedule I.

Considering the greatest good for society, it is worth considering a wide range of legislative options for regulating this drug that fall below Schedule I control.

Sincerely,

Matthew W. Johnson, Ph.D.  
Instructor, Dept. of Psychiatry &  
Behavioral Sciences

s.19(1)

**Fw: Email to Chris Sannerud re: Salvia**  
Stephanie Chandler to: Denis Arsenault

2010-12-13 09:31 AM

Hi Denis,

Please see the letter below which I have drafted to the DEA re: Salvia. I'm uncertain as to what our usual protocol is in terms of communicating with other regulatory authorities, so I am wondering if it would be appropriate to mention the NOI and our proposal to schedule Salvia and salvinorin A despite the fact that neither the MLs or NOI have been DG approved yet?

Stephanie

Dear [REDACTED]

The Office of Controlled Substances (OCS) of Health Canada is currently finalizing its scheduling assessment of the hallucinogenic plant *Salvia divinorum*. At this time, neither *S. divinorum* nor its active ingredient salvinorin A are included in any of the schedules to Canada's *Controlled Drugs and Substances Act (CDSA)*.

According to the National Institute of Drug Abuse (NIDA) website, the Drug Enforcement Administration (DEA) is considering classifying *S. divinorum* as a Schedule I drug. In order to complete our assessment of this plant, I would like to confirm the current regulatory status of *S. divinorum* as well as salvinorin A in the United States. Any additional information regarding the federal control of these substances which you would be able to provide us would also be greatly appreciated.

→ whether this is the case.

Should you have any questions with regard to this request, please do not hesitate to contact me.

Yours Sincerely,

----- Forwarded by Stephanie Chandler/HC-SC/GC/CA on 2010-12-13 09:13 AM -----

**Subject:** FYI: Salvia divinorum TIME article

FYI

The Time article seems to be a bit misleading as it states "federal legislation has been introduced to regulate the plant as a Schedule I drug". In 2002, a bill was introduced in the US Congress to control Salvia, however that bill subsequently died and it appears that no new legislation has since been introduced. However, as stated in the IAS "According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs."

Dear Colleagues and Friends,

I hope this email finds you well. I know that some of you are very interested in the hallucinogenic plant *Salvia divinorum*, as in many places its use is growing. Attached is a new article from Time which may be of interest to you.

(See attached file: Mexico - *Salvia divinorum* TIME 8 Dec 2010.pdf)

**s.19(1)**

Kind regards,

Thanks Jocelyn.

I figured she was busy with other more pressing issues, however, thanks to Miley Cyrus' recent activities there has been some interest in the topic and we expect enquiries. When they come in, we will attempt to respond using previously used messaging and sent your way for review.

Get well soon.

Hi Nicole

The docs went to Cathy late last week but she has not had an opp to review yet as she has been almost completely tied up with meetings and briefings connected to the tobacco-related discussions at HESA and now the forthcoming announcement that I believe has been planned for Thursday.

I am at home sick today but will check in with DGO when I am back in the office tomorrow.

Subject: Updated Media Lines and Draft Notice of Intent for Salvia

---

Hi Stephanie,

Per previous instruction from Cathy and for Cathy's review and approval, please find attached a copy of the revised media lines for Salvia as well as our proposed Notice of Intent. We have worked with Comms

on the media lines, and they are comfortable with us submitting them for Cathy's approval ourselves as we know that Cathy wanted to see both the media lines and the draft NOI at the same time. For this reason, we are not submitting the IYH for approval at this point; our thinking is that we would hold off on issuing that until the NOI was in print. We have already revised the text to be consistent however.

## RPD Telephone Enquiry

**Date of Call:** December 13, 2010

**Subject:** Status of *Salvia divinorum* and current media attention

**Language of Correspondence:** English

s.19(1)

**Caller Name:** [REDACTED]

**Caller Organization:** Saskatoon Police Services Drug Unit

**Caller Telephone Number:** (306) 221-9899

### CALL SUMMARY:

[REDACTED] of the Drug Unit of Saskatoon Police Services called to enquire as to whether Health Canada was looking into scheduling this substance under the *Controlled Drugs and Substances Act* (CDSA).

I indicated that Health Canada is currently assessing *S. divinorum* to determine whether it should be scheduled under the CDSA. He asked if this was an active assessment by Health Canada, or if this substance was simply "on our radar". I indicated to [REDACTED] that we are actively assessing *S. divinorum* to determine whether its regulation as a controlled substance would be appropriate.

[REDACTED] indicated that *S. divinorum* has garnered a lot of media attention in Saskatchewan lately. He has received a number of inquiries regarding *S. divinorum* recently, particularly after a recent YouTube video was posted online showing an American celebrity using this substance presumably to achieve a high.

BACKGROUND - CONTEXTE

English:

BACKGROUND / CONTEXTE

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are

also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Active

*S. divinorum* is known to have both physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Salvinorin A -  
Main active  
ingredient.

International Control of *S. divinorum*

At the present time, *S. divinorum* is not listed under the United Nations Drug Control Conventions which means that it is not required to be regulated as a controlled substance in any of the countries that are signatories to these Conventions. However, some countries have decided to control *S. divinorum* on their own. In Australia, Belgium, Denmark, Sweden, Italy, Finland, and SouthNorth Korea, the possession and sale of *S. divinorum* is illegal. In Spain, its sale is prohibited, but possession or use is not. In Norway, *S. divinorum* cannot be imported without a prescription, and in Japan has recently passed a law that will take effect in April 2007 which totally bans all activities with *S. divinorum* have been banned. In the United States, *S. divinorum* is not regulated as a controlled substance by the US Drug Enforcement Administration; however, although some states such as Missouri, Louisiana, Tennessee and Delaware have implemented laws restricting its use, sale and/or distribution.

Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under is currently completing a review of *Salvia divinorum* against the criteria considered in adding substances to one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under drugs listed in the CDSA;
- Dependence potential; Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.
- Likelihood of abuse/misuse;
- Extent of abuse/misuse in Canada;
- Danger to public health and safety; and,
- Legitimate use in Canada

Its main active ingredient is the 1st reference. What is Salvinorin A? - we have much info. here re. Salvinorin A? But need some info. D

Health Canada recently concluded its assessment of *S. divinorum* (and salvinorin A) against the aforementioned factors and now proposes to include both substances in one of the Schedules to the CDSA.

Once this work has been completed, Health Canada will inform stakeholders of its decision. A regulatory proposal will be developed in the coming months.

Presently, because of its hallucinogenic properties, when products containing *S. divinorum* or salvinorin A are

are they? Synonym 001897

marketed for use as hallucinogens they meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act* . It is illegal to sell drugs or NHPs in Canada unless they have been reviewed and approved by Health Canada. As of December/September 2010, no products containing *S. divinorum* or salvinorin A have been authorized for sale by Health Canada.

Hi both,

Have put handwritten comments/questions to the note -- have left in Jocelyn's inbox here in DGO for pick up.

Glad to come to your office to chat.

Let me know,

Stephanie Szick  
Director General's Office / Bureau du directeur général  
Controlled Substances & Tobacco Directorate (CSTD) /  
Direction des substances contrôlées et de la lutte au tabagisme (DSCLT)  
Health Canada / Santé Canada  
Tel / Tél: (613) 948-8651

Jocelyn Kula	As requested. I am leaving early for an appt but...	2010-12-14 01:43:30 PM

Subject: Salvia D QP note update

hello all,

Further to the media clip and Cathy's request of this morning per below ---

- I have found in the QP working database a QP note on Salvia revised in Sept. 2010 -- here is the link

to that note --- 

- Given the very recent work on this file, the note should be further fine-tuned and the key messages should line up with the revised media lines. I've attached here the media lines as provided when you sent the NOI last week for Cathy's review/approval. Cathy has seen both but I need to follow up with her on her approvals. Will let you know asap.

[attachment "Salvia Media Lines\_10-12-10.doc" deleted by Jocelyn Kula/HC-SC/GC/CA]

REQUEST -- Can you revise this QP and send to DGO for Cathy's approval by tomorrow COB, Tuesday, Dec. 14/10 ? Please let us know if this time is doable, and if not, what date/time works best?

Sonia - please note for BF list - revised Salvia D QP note.

Thanks very much,  
Stephanie

**Hallucinogen salvia popular for its intense high**

Source: [ctv.ca/health](http://ctv.ca/health)

The once squeaky-clean image of former teen Disney star Miley Cyrus took another hit – so to speak – this weekend, when a video emerged of her purportedly smoking a bong filled with the stuff.

While her father Billy Ray Cyrus is said to be saddened by the video, which appears on the celebrity gossip website TMZ.com, plenty of others are asking: what is salvia and is it legal?

Turns out the hallucinogen -- officially called Salvia divinorum -- is legal in the state of California where Cyrus apparently used it, though it's illegal in 12 other U.S. states. It's also illegal in Canada, although it is openly marketed by some "head shops" in Canada.

Dr. Bryan Roth, a professor of pharmacology at the University of North Carolina explains that the drug is an intense hallucinogenic that's fairly new on the drug scene. He says in the late '90s, recreational drug growers learned how to add the purified active ingredient, salvinorum A, to plants.

"It's only in the last four or five years that it has taken off as a fad," he told CTV's Canada AM from Chapel Hill, N.C.

Yet while its popularity is new, the hallucinogen, with is part of the sage and mint families, has been used for centuries by shamans in Mexico for spiritual healing. In fact, the name salvia means "to heal" and divinorum means "divination." The drug is also known as "diviner's sage" and "magic mint."

What makes salvia so popular is that it gives an intense high that takes just a few seconds to kick in and that lasts only a few minutes.

"Most people describe the effects as nearly instantaneous," Roth explained. "They're basically disassociated from normal reality. The effects of that can range from hilarious laughter, like you see with Miley Cyrus, to stark terror. Then within five to 15 minutes, the effects abate. And within half an hour, people are back to normal."

While research on the drug is scant, a U.S. government-funded study was released just last week in the journal Drug and Alcohol Dependence. In the study, researchers from the Johns Hopkins School of Medicine tested the drug on four subjects with prior experience with hallucinogens.

Two users rated the strength of the effect as "as strong as imaginable" -- considered unusual for people with prior experience with hallucinogens.

The subjects also reported the drug's effects were different from those caused by LSD or "magic mushrooms." While those drugs leave users high but still aware of the world around them, the salvia users said they felt as if they had completely left reality, gone to "other worlds or dimensions," had "contact with entities," and experienced "mystical-type" effects, the researchers reported.

There were no physical effects of the drug, the researchers found: no significant heart rate or blood pressure changes, no tremors or other side effects. And animal studies indicate the drug is not addictive.

Still, Roth points out, because salvia is not well studied yet, the long-term effects on the brain are unknown.

Here in Canada, the popularity of the drug is said to be growing. According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey, about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent.

## QUESTION PERIOD NOTE

## NOTE POUR LA PÉRIODE DE QUESTIONS

Date:	December 14, 2010
Classification :	HECS PROTECTED - SESC PROTÉGÉ

---

### SUBJECT - SUJET

English:

**DRUGS - SALVIA DIVINORUM**

Français:

**DROGUES - SALVIA DIVINORUM**

---

### SYNOPSIS - SOMMAIRE

English:

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young Hollywood celebrity Miley Cyrus smoking Salvia divinorum. There have also been several reports from scientific and media sources, which indicate that Salvia divinorum has the potential for abuse, and is used by adolescents and young adults for its hallucinogenic properties.

---

### ANTICIPATED QUESTION - QUESTION PRÉVUE

English:

What is Health Canada doing to protect Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

---

English:

- Health Canada has concluded its assessment of *Salvia divinorum* and salvinorin A and is proposing to include both substances in one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA). ~~is currently considering whether *Salvia divinorum* be scheduled under the *Controlled Drugs and Substances Act*.~~
- ~~Health Canada through these actions is taking the will take necessary stepsactions to safeguard Canadians against~~ The inclusion of *Salvia divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with the availability and potential abuse of ~~this~~ these substances.
- Health Canada will inform stakeholders of its proposal by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

Français:

---

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are

also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

*S. divinorum* is known to have both physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

#### International Control of *S. divinorum*

At the present time, *S. divinorum* is not listed under the United Nations Drug Control Conventions which means that it is not required to be regulated as a controlled substance in any of the countries that are signatories to these Conventions. However, some countries have decided to control *S. divinorum* on their own. In Australia, Belgium, Denmark, Sweden, Italy, Finland, and SouthNorth Korea, the possession and sale of *S. divinorum* is illegal. In Spain, its sale is prohibited, but possession or use is not. In Norway, *S. divinorum* cannot be imported without a prescription, and in Japan ~~has recently passed a law that will take effect in April 2007 which totally bans all activities with *S. divinorum* have been banned.~~ In the United States, *S. divinorum* is not regulated as a controlled substance by the US Drug Enforcement Administration; however, although some states such as Missouri, Louisiana, Tennessee and Delaware have implemented laws restricting its use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under ~~is currently completing a review of *Salvia divinorum* against the criteria considered in adding substances to one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:~~

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under ~~drugs listed in the CDSA;~~
- Dependence potential; Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.
- Likelihood of abuse/misuse;
- Extent of abuse/misuse in Canada;
- Danger to public health and safety; and,
- Legitimate use in Canada

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and now proposes to include both substances in one of the Schedules to the CDSA.

~~Once this work has been completed, Health Canada will inform stakeholders of its decision. A regulatory proposal will be developed in the coming months.~~

Presently, ~~because of its hallucinogenic properties,~~ when products containing *S. divinorum* or salvinorin A are

marketed for use as hallucinogens they meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada unless they have been reviewed and approved by Health Canada. As of December/September 2010, no products containing *S. divinorum* or salvinorin A have been authorized for sale by Health Canada.

Hallucinogen salvia popular for its intense high

<http://www.ctv.ca/CTVNews/Health/20101213/salvia-cyrus-101213/>

The once squeaky-clean image of former teen Disney star Miley Cyrus took another hit - so to speak - this weekend, when a video emerged of her purportedly smoking a bong filled with salvia.

While her father Billy Ray Cyrus is said to be saddened by the video, which appears on the celebrity gossip website TMZ.com, plenty of others are asking: what is salvia and is it legal?

Turns out the hallucinogen -- officially called Salvia divinorum -- is legal in the state of California where Cyrus apparently used it, though it's illegal in 12 other U.S. states. It's also illegal in Canada, although it is openly marketed by some "head shops" in Canada.

Dr. Bryan Roth, a professor of pharmacology at the University of North Carolina explains that the drug is an intense hallucinogenic that's fairly new on the drug scene. He says in the late '90s, recreational drug growers learned how to add the purified active ingredient, salvinorum A, to plants.

"It's only in the last four or five years that it has taken off as a fad," he told CTV's Canada AM from Chapel Hill, N.C.

Yet while its popularity is new, the hallucinogen, with its part of the sage and mint families, has been used for centuries by shamans in Mexico for spiritual healing. In fact, the name salvia means "to heal" and divinorum means "divination." The drug is also known as "diviner's sage" and "magic mint."

What makes salvia so popular is that it gives an intense high that takes just a few seconds to kick in and that lasts only a few minutes.

"Most people describe the effects as nearly instantaneous," Roth explained. "They're basically disassociated from normal reality. The effects of that can range from hilarious laughter, like you see with Miley Cyrus, to stark terror. Then within five to 15 minutes, the effects abate. And within half an hour,

people are back to normal."

While research on the drug is scant, a U.S. government-funded study was released just last week in the journal *Drug and Alcohol Dependence*. In the study, researchers from the Johns Hopkins School of Medicine tested the drug on four subjects with prior experience with hallucinogens.

Two users rated the strength of the effect as "as strong as imaginable" -- considered unusual for people with prior experience with hallucinogens.

The subjects also reported the drug's effects were different from those caused by LSD or "magic mushrooms." While those drugs leave users high but still aware of the world around them, the salvia users said they felt as if they had completely left reality, gone to "other worlds or dimensions," had "contact with entities," and experienced "mystical-type" effects, the researchers reported.

There were no physical effects of the drug, the researchers found: no significant heart rate or blood pressure changes, no tremors or other side effects. And animal studies indicate the drug is not addictive.

Still, Roth points out, because salvia is not well studied yet, the long-term effects on the brain are unknown.

Here in Canada, the popularity of the drug is said to be growing. According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey, about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent.

Products containing salvia divinorum or its active ingredient, salvinorin A, are considered natural health products and, must be authorized by Health Canada in order to be sold. Since Health Canada has not licensed any product containing salvia, sales are illegal.

Health Canada is still reviewing whether salvia should be included in the Controlled Drugs and Substances Act, which bans other hallucinogens, such as peyote, magic mushrooms and LSD.

## BACKGROUND - CONTEXTE

English:

### BACKGROUND / CONTEXTE

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have both physical and

mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

#### International Control of *S. divinorum*

At the present time, *S. divinorum* and its main active ingredient salvinorin A are not listed under the United Nations Drug Control Conventions which means that they are not required to be regulated as a controlled substances in any of the countries that are signatories to these Conventions. However, some countries have decided to control *S. divinorum* and/or salvinorin A on their own. In Australia, Belgium, Denmark, Sweden, and SouthNorth Korea, the possession and sale of *S. divinorum* is illegal. In Spain, the sale of *S. divinorum* is prohibited, but possession or use is not. In Norway, *S. divinorum* cannot be imported without a prescription, and in Japan has recently passed a law that will take effect in April 2007 which totally bans all activities with salvinorin A have been banned. In the United States, neither *S. divinorum* nor salvinorin A are regulated as controlled substances by the US Drug Enforcement Administration; however, although some states such as Missouri, Louisiana, Tennessee and Delaware have implemented laws restricting the use, sale and/or distribution of one or both substances.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under is currently completing a review of *Salvia divinorum* against the criteria considered in adding substances to one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under drugs listed in the CDSA;
- Dependence potential; Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.
- Likelihood of abuse/misuse;
- Extent of abuse/misuse in Canada;
- Danger to public health and safety; and,
- Legitimate use in Canada

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in one of the Schedules to the CDSA.

Once this work has been completed, Health Canada will inform stakeholders of its decision. A regulatory proposal will be developed in the coming months.

Presently, because of its hallucinogenic properties, when products containing *S. divinorum* or salvinorin A are marketed for use as hallucinogens they meet the definition of a Natural Health Product (NHP) in accordance with hallucinogenic properties, it meets <sup>as</sup> <sup>is a plant with</sup> under the

*when marketed as a hallucinogen*  
~~the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act . It is illegal to sell drugs or NHPs in Canada unless they have been reviewed and approved by Health Canada. As of December/September 2010, no products containing S. divinorum or salvinorin A have been authorized for sale by Health Canada.~~ *As of Dec 2010, Health Canada has not licensed for sale any NHPs which contain S. divinorum as an ingredient. The sale of unauthorized NHPs containing S. divinorum and/or salvinorin A may be subject to compliance & enforcement acts by HC under the FDA.*

Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have both physical and

mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

#### International Control of *S. divinorum*

At the present time, *S. divinorum* and its main active ingredient salvinorin A are not listed under the United Nations Drug Control Conventions which means that they are not required to be regulated as a controlled substances in any of the countries that are signatories to these Conventions. However, some countries have decided to control *S. divinorum* and/or salvinorin A on their own. In Australia, Belgium, Denmark, Sweden, and SouthNorth Korea, the possession and sale of *S. divinorum* is illegal. In Spain, the sale of *S. divinorum* is prohibited, but possession or use is not. In Norway, *S. divinorum* cannot be imported without a prescription, and in Japan has recently passed a law that will take effect in April 2007 which totally bans all activities with salvinorin A have been banned. In the United States, neither *S. divinorum* nor salvinorin A are regulated as controlled substances by the US Drug Enforcement Administration; however, although some states such as Missouri, Louisiana, Tennessee and Delaware have implemented laws restricting the use, sale and/or distribution of one or both substances.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under ~~is currently completing a review of *Salvia divinorum* against the criteria considered in adding substances to one of the Schedules to the Controlled Drugs and Substances Act (CDSA) is warranted, namely:~~

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under drugs listed in the CDSA;
- Dependence potential; Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.
- Likelihood of abuse/misuse;
- Extent of abuse/misuse in Canada;
- Danger to public health and safety; and,
- Legitimate use in Canada

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in one of the Schedules to the CDSA.

~~Once this work has been completed, Health Canada will inform stakeholders of its decision. A regulatory proposal will be developed in the coming months.~~

Presently, ~~because of its hallucinogenic properties, when products containing *S. divinorum* or salvinorin A are marketed for use as hallucinogens they meet the definition of a Natural Health Product (NHP) in accordance with~~

the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada unless they have been reviewed and approved by Health Canada. As of December/September 2010, no products containing *S. divinorum* or salvinorin A have been authorized for sale by Health Canada.

Hi Jocelyn,

No. They have just asked us to simplify the bullets even more, and provide a bit more bumf in the background section regarding salvinorin A (i.e. how is salvinorin A different from salvia divinorum?)

The new version is ready for your review in the database.

**Subject:** Salvia D QP note update

hello all,

Further to the media clip and Cathy's request of this morning per below ---

- I have found in the QP working database a QP note on Salvia revised in Sept. 2010 -- here is the link to that note --- 
- Given the very recent work on this file, the note should be further fine-tuned and the key messages should line up with the revised media lines. I've attached here the media lines as provided when you sent the NOI last week for Cathy's review/approval. Cathy has seen both but I need to follow up with her on her approvals. Will let you know asap.

[attachment "Salvia Media Lines\_10-12-10.doc" deleted by Jocelyn Kula/HC-SC/GC/CA]

**REQUEST** -- Can you revise this QP and send to DGO for Cathy's approval by tomorrow COB, Tuesday, Dec. 14/10 ? Please let us know if this time is doable, and if not, what date/time works best?

**Sonia** - please note for BF list - revised Salvia D QP note.

Thanks very much,  
Stephanie

### **Hallucinogen salvia popular for its intense high**

Source: [ctv.ca/health](http://ctv.ca/health)

The once squeaky-clean image of former teen Disney star Miley Cyrus took another hit – so to speak – this weekend, when a video emerged of her purportedly smoking a bong filled with the stuff.

While her father Billy Ray Cyrus is said to be saddened by the video, which appears on the celebrity gossip website TMZ.com, plenty of others are asking: what is salvia and is it legal?

Turns out the hallucinogen -- officially called Salvia divinorum -- is legal in the state of California where Cyrus apparently used it, though it's illegal in 12 other U.S. states. It's also illegal in Canada, although it is openly marketed by some "head shops" in Canada.

Dr. Bryan Roth, a professor of pharmacology at the University of North Carolina explains that the drug is an intense hallucinogenic that's fairly new on the drug scene. He says in the late '90s, recreational drug growers learned how to add the purified active ingredient, salvinatorum A, to plants.

"It's only in the last four or five years that it has taken off as a fad," he told CTV's Canada AM from Chapel Hill, N.C.

Yet while its popularity is new, the hallucinogen, with is part of the sage and mint families, has been used for centuries by shamans in Mexico for spiritual healing. In fact, the name salvia means "to heal" and divinorum means "divination." The drug is also known as "diviner's sage" and "magic mint."

What makes salvia so popular is that it gives an intense high that takes just a few seconds to kick in and that lasts only a few minutes.

"Most people describe the effects as nearly instantaneous," Roth explained. "They're basically disassociated from normal reality. The effects of that can range from hilarious laughter, like you see with Miley Cyrus, to stark terror. Then within five to 15 minutes, the effects abate. And within half an hour, people are back to normal."

While research on the drug is scant, a U.S. government-funded study was released just last week in the journal Drug and Alcohol Dependence. In the study, researchers from the Johns Hopkins School of Medicine tested the drug on four subjects with prior experience with hallucinogens.

Two users rated the strength of the effect as "as strong as imaginable" -- considered unusual for people with prior experience with hallucinogens.

The subjects also reported the drug's effects were different from those caused by LSD or "magic mushrooms." While those drugs leave users high but still aware of the world around them, the salvia users said they felt as if they had completely left reality, gone to "other worlds or dimensions," had "contact with entities," and experienced "mystical-type" effects, the researchers reported.

There were no physical effects of the drug, the researchers found: no significant heart rate or blood pressure changes, no tremors or other side effects. And animal studies indicate the drug is not addictive.

Still, Roth points out, because salvia is not well studied yet, the long-term effects on the brain are unknown.

Here in Canada, the popularity of the drug is said to be growing. According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey, about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent.

## Tentative CSS-WG Meeting

2010-12-15 Wed 10:30 AM - 12:00 PM

Attendance is **optional** for Stephanie Chandler

Chair: Tiffany Thornton/HC-SC/GC/CA

Location: 629B, 123 Slater

Required:

Bruna Brands/HC-SC/GC/CA@HWC, Colette Strnad/HC-SC/GC/CA@HWC, Collin Pinto/HC-SC/GC/CA@HWC, Courtney Smith/HC-SC/GC/CA@HWC, Denis Arsenault/HC-SC/GC/CA@HWC, Evelyn Soo/HC-SC/GC/CA@HWC, Hanan Abramovici/HC-SC/GC/CA@HWC, Robin Marles/HC-SC/GC/CA@HWC, Suzanne Desjardins/HC-SC/GC/CA@HWC, Tanja Kalajdzic/HC-SC/GC/CA@HWC, Tiana Branch/HC-SC/GC/CA@HWC

Optional:

Isabel Shanahan/HC-SC/GC/CA@HWC, Jocelyn Kula/HC-SC/GC/CA@HWC, Laura Cooney/HC-SC/GC/CA@HWC, Stephanie Chandler/HC-SC/GC/CA@HWC

### Description

Hi everyone,

Please note that this is a tentative meeting at this time - it might be cancelled if no issues need to be discussed. I will keep you posted.

The ROD from November 16th will be circulated shortly. Please find attached the most recent version of the IAS, however keep in mind that it has not been approved by the Director of OCS and does not include comments from the NOI. If you have further input please send your comments directly to Stephanie Chandler.

Draft Salvia Divinorum IAS\_Oct 29 2010.doc

Thanks very much,  
Tiffany

Controlled Substances and Tobacco Directorate

---

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*,) which is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the

availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled

---

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers a number of factors including:

- International requirements and trends in the control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *S. Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in the Control and/or Scheduling**

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", but this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Agency is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marijuana.

In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture

and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

## **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

$\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>17</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec

Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder, but there has been no clinical research to support these hypotheses.<sup>30</sup> That said there are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine,

<sup>32</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman’s The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the

KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. In some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia".

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;

---

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and
- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. Salvia appears however to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other illicit substances.

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Agency (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as both these substances are not listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may only reflect an increased awareness of the phenomenon.

#### **4.2.6 Risk to Personal and Public Health and Safety**

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and

walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

**s.21(1)(a)**

**s.21(1)(b)**

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

**5. ASSESSMENT OF RISKS AND BENEFITS**

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin.

There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*. While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of abuse, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore salvinorin A results in the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

s.21(1)(a)  
s.21(1)(b)

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

## Salvia, made popular by Miley Cyrus video, sold legally in Vancouver; Hallucinogenic plant legal in Canada; 15 U.S. states have banned it

---

The drug Salvia divinorum, made famous in the viral You-Tube video in which pop star Miley Cyrus smokes a bong, has been sold quietly for at least the past 10 years in Vancouver.

Fox News and other agencies are reporting that sales of the drug have tripled in some U.S. states, such as California, where people are specifically asking for "the stuff Miley was **smoking.**"

But Vancouver Seed Bank owner Rebecca Ambrose says Salvia has long had a following of perhaps a few hundred people locally.

"People come in fairly steadily asking about it and the effects from it, but we haven't seen a big influx," Ambrose said. The East Hastings shop sells live cuttings and a concentrated form. "We sell out of it quite regularly."

"A wide range of people are interested in its psychedelic effects and don't want to be out of it for a long time," she said. "It's not like mushrooms or LSD where you are in for an eight-hour journey. In its extract form, Salvia causes an intense hallucinogenic effect for about 15 minutes."

The drug is widely available on the Internet in both Canada and the United States as a dried leaf, a tobacco-like form fortified to enhance its potency, an alcohol-based tincture and a nearly pure crystalline form, used mainly for research purposes.

Salvia, made popular by Miley Cyrus video, sold legally in Vancouver; Hallucinogenic pl... Page 2 of 2

The leaves of the plant have been used for centuries by Mazatec Indians in Oaxaca, Mexico, mainly by shamans seeking to induce visions.

A powerful hallucinogen in its concentrated form, the plant and its derivatives are completely legal in Canada, according to the RCMP. Fifteen U.S. states have banned it.

Cyrus was videotaped **smoking** the herb from a glass pipe known as a bong on her 18th birthday. She begins to laugh hysterically and is heard to say: "Omigod, I'm having a bit of a bad trip."

"I always recommend that people do it with someone who won't be **smoking** it so you have someone there to make you feel secure," said Ambrose. "You do for 15 minutes lose all sense of time and space."

**Re: Urgent - Media Inquiry - Salvia (RCMP)** 

Christine Roush to: Jocelyn Kula

2010-12-15 10:37 AM

Cc: Stephanie Chandler, Nicole Prentice

History: This message has been replied to and forwarded.

Jocelyn,

Below is an email I just received from the Comms shop at the RCMP who have received a media inquiry about Salvia. Could you please take a look at their suggested response and let me know as soon as possible if you are OK with it. As well, we really need to get our new Salvia media lines approved as quickly as possible, as Salvia has been in the news quite a bit in the last week. I believe they are currently with Cathy. Is there anything you can do to facilitate her approval so we can keep these moving and have them fully approved before Christmas?

\*\*\*\*\*

Hi Christine...as I suspected, we've received a media query about our stance on Salvia out in H Division (Halifax). I drafted the following brief holding lines, but would appreciate if you could advise if they're ok...I'm just learning about this substance myself. For most info, I would refer them to HC...

Many thanks,

Robin Percival

**RCMP Media Lines - DRAFT**  
**Not for distribution**

---

**Date: December, 2010**

**Re: Salvia Divinorum**

---

**Issue:** *Salvia divinorum* is a plant with psychoactive properties which when smoked or chewed can cause a number of physical and mental effects including hallucinations and/or triggering a “high”. *Salvia divinorum* is available online and in head shops and its popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent. While several countries have placed controls on the import and/or sale of this substance, it is not currently regulated in Canada under the *Controlled Drugs and Substances Act* (CDSA) and its Regulations. Health Canada is currently assessing whether the control of *Salvia divinorum* under the CDSA is warranted. However, when products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as for their hallucinogenic effects) they meet the definition of a natural health product and, as such, must be authorized by Health Canada before they can be sold.

**Media Lines**

- The RCMP is aware of the presence of this substance in Canada; however, to date, it hasn't surfaced as a significant problem.
- As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (and potential abuse) of *Salvia divinorum*.
- As products containing *Salvia divinorum* that are marketed for use as hallucinogens are considered natural health products, it is in contravention of the *Natural Health Products Regulations* to sell them without approval from Health Canada.

**ONLY IF ASKED:**

Q: If it's illegal to sell Salvia in Canada, why aren't the RCMP charging stores or (people) for selling (using) it here?

A: It is currently only illegal to sell Salvia products that are marketed for use as hallucinogens. Such unauthorized products may be subject to compliance and enforcement by Health Canada. Most of the products that the RCMP and Health Canada are aware of are not sold in this way. Law enforcement cannot seize *Salvia divinorum* unless it is regulated as a controlled substance under the

*Controlled Drugs and Substances Act (CDSA).*

Q: Will you be moving to make it illegal under the CDSA?

A: (Refer to Health Canada).

**Please refer all other questions on Salvia (effects, legal status, etc.) to Health Canada.**

**Date: December, 2010**

**Re: Salvia Divinorum**

---

**Issue:** *Salvia divinorum* is a plant with psychoactive properties which when smoked or chewed can cause a number of physical and mental effects including hallucinations and/or triggering a "high". *Salvia divinorum* is available online and in head shops and its popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent. While several countries have placed controls on the import and/or sale of this substance, it is not currently regulated in Canada under the *Controlled Drugs and Substances Act* (CDSA) and its Regulations. Health Canada is currently assessing whether the control of *Salvia divinorum* under the CDSA is warranted. However, when products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as for their hallucinogenic effects) they meet the definition of a natural health product and, as such, must be authorized by Health Canada before they can be sold.

**Media Lines**

- The RCMP is aware of the presence of this substance in Canada, ~~however, to date, it hasn't surfaced as a significant problem.~~
- As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (and potential abuse) of *Salvia divinorum*.
- As products containing *Salvia divinorum* that are marketed for use as hallucinogens are considered natural health products, it is in contravention of the *Natural Health Products Regulations* to sell them without approval from Health Canada.

**ONLY IF ASKED:**

Q: If it's illegal to sell Salvia in Canada, why aren't the RCMP charging stores or (people) for selling (using) it here?

A: It is currently only illegal to sell Salvia products that are marketed for use as hallucinogens. Such unauthorized products may be subject to compliance and enforcement by Health Canada. **RCMP Media Lines - DRAFT**  
**Not for distribution**

---

**Date: December, 2010**

**Re: Salvia Divinorum**

---

**Issue:** *Salvia divinorum* is a plant with psychoactive properties which when smoked or chewed can cause a number of physical and mental effects including hallucinations and/or triggering a “high”. *Salvia divinorum* is available online and in head shops and its popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent. While several countries have placed controls on the import and/or sale of this substance, it is not currently regulated in Canada under the *Controlled Drugs and Substances Act* (CDSA) and its Regulations. Health Canada is currently assessing whether the control of *Salvia divinorum* under the CDSA is warranted. However, when products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as for their hallucinogenic effects) they meet the definition of a natural health product and, as such, must be authorized by Health Canada before they can be sold.

**Media Lines**

- The RCMP is aware of the presence of this substance in Canada; however, to date, it hasn't surfaced as a significant problem.
- As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (and potential abuse) of *Salvia divinorum*.
- As products containing *Salvia divinorum* that are marketed for use as hallucinogens are considered natural health products, it is in contravention of the *Natural Health Products Regulations* to sell them without approval from Health Canada.

**ONLY IF ASKED:**

Q: If it's illegal to sell Salvia in Canada, why aren't the RCMP charging stores or (people) for selling (using) it here?

A: It is currently only illegal to sell Salvia products that are marketed for use as hallucinogens. Such unauthorized products may be subject to compliance and enforcement by Health Canada. Most of the products that the RCMP and Health Canada are aware of are not sold in this way. Law enforcement cannot seize *Salvia divinorum* unless it is regulated as a controlled substance under the

*Controlled Drugs and Substances Act (CDSA).*

RCMP Media Lines - DRAFT  
Not for distribution

Date: December, 2010

Re: Salvia Divinorum

is this consistent with our lines  
didn't think we used

Issue: *Salvia divinorum* is a plant with psychoactive properties which when smoked or chewed can trigger an intense high and hallucinations. It is available online and in head shops, and while several countries have now banned it, to date it is not regulated in Canada under the *Controlled Drugs and Substances Act* and its Regulations in Canada.

also  
that  
about  
and/or  
ie. some  
people  
don't  
halluci-  
rate

It's popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent.

When products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as, for their hallucinogenic effects) they meet the definition of a considered natural health products and, as such, must be authorized by Health Canada before they can be sold.

Media Lines

1. The RCMP is aware of the presence of this substance in Canada; however, to date, it hasn't surfaced as a significant problem.

3. As *Salvia divinorum* products that are marketed for use as hallucinogens are considered natural health products, it in contravention of the *Natural Health Products Regulations* is illegal to sell them without ~~Health Canada's authorization~~ approval from Health Canada.

2. As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (or abuse) of *Salvia divinorum*.

and potential

ONLY IF ASKED:

Q: If it's illegal to sell Salvia in Canada, why aren't the RCMP charging stores or (people) for selling (using) it here?

A: ~~When Salvia products are marketed for use as hallucinogens, they are considered natural health products which can't be lawfully sold without Health Canada's authorization. However, Salvia isn't controlled/regulated under the Controlled Drugs and Substances Act, which is what we enforce.~~  
that  
it is currently only illegal to sell and most of the products that the RCMP is aware of are not sold in this way.

Q: Will you be moving to make it illegal under the CDSA?

Law enforcement  
cannot seize it  
is it?

appears  
very  
critical  
of HC  
can we  
soften?

A: (Refer to Health Canada).

*legal status*  
**Please refer all other questions on Salvia (effects, etc.) to Health Canada.**

revised per comments from yesterday. guess we will be discussing this afternoon.  
FYI- urgent advice on RCMP lines on salvia will be coming to Cathy for approval this afternoon; also, all  
the media attention has made the IYH Salvia team ask about the status of the doc. I have responded and  
said that our scheduling recommendation is with Cathy for approval.....

Not exactly, we just want the IYH to reflect the recommendation to schedule (which is still with our DG for approval) and we can't publish the IYH until we publish an NOI stating our intent to schedule in the *Canada Gazette*. So, the scheduling process does not need to be completed per se, but just out of the cabinet confidence "zone".

We will keep you posted as we move along. For now, we are concentrating on getting media lines and the NOI approved, and helping the RCMP with its media lines (they seem to be getting the brunt of enquiries apparently).....

 Subject: Re: Urgent - Media Inquiry - Salvia (RCMP)

Jocelyn,

Below is an email I just received from the Comms shop at the RCMP who have received a media inquiry about Salvia. Could you please take a look at their suggested response and let me know as soon as possible if you are OK with it. As well, we really need to get our new Salvia media lines approved as quickly as possible, as Salvia has been in the news quite a bit in the last week. I believe they are currently with Cathy. Is there anything you can do to facilitate her approval so we can keep these moving and have them fully approved before Christmas?

\*\*\*\*\*

Hi Christine...as I suspected, we've received a media query about our stance on Salvia out in H Division (Halifax). I drafted the following brief holding lines, but would appreciate if you could advise if they're ok...I'm just learning about this substance myself. For most info, I would refer them to HC...

Many thanks,

**Date: December, 2010**

**Re: Salvia Divinorum**

---

**Issue:** *Salvia divinorum* is a plant with psychoactive properties which when smoked or chewed can cause a number of physical and mental effects including hallucinations and/or triggering an intense "high". *Salvia divinorum* is available online and in head shops and its popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent. and hallucinations. It is available online and in head shops, and

When products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as for their hallucinogenic effects) they meet the definition of a natural health product and, as such, must be authorized by Health Canada before they can be sold.

While several countries have placed controls on the import and/or sale of this substance, now banned it, to date it is not currently regulated in Canada under the *Controlled Drugs and Substances Act* (CDSA) and its Regulations in Canada. Health Canada is currently assessing whether regulation the control of *Salvia divinorum* under the CDSA is warranted.

However, when products containing *Salvia divinorum* are marketed for the purposes of modifying an organic function (such as for their hallucinogenic effects) they meet the definition of a natural health product and, as such, must be authorized by Health Canada before they can be sold.

It's popularity is growing: According to the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS), about 1.6 per cent of Canadians aged 15 or older have tried salvia. For those aged 15-24, the number rises to 7.3 per cent.

Products containing *salvia divinorum* are considered natural health products and, as such, must be authorized by Health Canada before they can be sold.

**Media Lines**

- The RCMP is aware of the presence of this substance in Canada, however, to date, it hasn't surfaced as a significant problem.
- As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (and potential abuse) of *Salvia divinorum*.
- As products containing *Salvia divinorum* products that are marketed for use as hallucinogens are considered natural health products, it is in contravention of the *Natural Health Products Regulations* is illegal to sell them without approval from Health Canada's authorization.

~~As with any substance whose long-term effects haven't been fully documented, the RCMP is concerned about the use (or abuse) of Salvia.~~

**ONLY IF ASKED:**

Q: If it's illegal to sell Salvia in Canada, why aren't the RCMP charging stores or (people) for selling (using) it here?

A: It is currently only illegal to sell Salvia products that are marketed for use as hallucinogens. Such unauthorized products may be subject to compliance and enforcement by Health Canada. Most of the products that the RCMP and Health Canada are aware of are not sold in this way. Law enforcement cannot seize *Salvia divinorum* unless it is regulated as a controlled substance under the *Controlled Drugs and Substances Act* (CDSA). ~~considered natural health products which can't be sold without Health Canada's authorization. However, Salvia isn't regulated under the *Controlled Drugs and Substances Act*, which is what we enforce.~~

Q: Will you be moving to make it illegal under the CDSA?

A: (Refer to Health Canada).

**Please refer all other questions on Salvia (effects, legal status, etc.) to Health Canada.**

**Updated by:** Robin Percival, Communications Strategist, Drugs and Organized Crime

**Approved by:** Supt. Eric Slinn, Dir., Drug Branch

**Fw: Media enquiry - Global National - Salvia**

Nicole Prentice to: Jocelyn Kula

2010-12-15 02:20 PM

Cc: Christine Roush, CSTD-OCS-DO, Stephanie Chandler, Denis Arsenault

Hi Jocelyn and team,

Here is the first of two salvia enquiries for your input/approval by 3pm today, if possible as this is due at 4. Proposed responses have been drafted from previous enquiries.

Thanks in advance.

Nicole

**Q1) is it legal?**

A1) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Q2) Is it a concern for HC?**

A2) Health Canada is aware of salvia and has noted media interest regarding the availability of *Salvia divinorum* in Canada.

Health Canada will continue to collect and study information about *S. divinorum* as it becomes available and is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Q3) Is it considered a drug?**

A3) *Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Health Canada considers several factors in determining whether regulation of a substance under the

*Controlled Drugs and Substances Act (CDSA)* is warranted.

These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Hi Jocelyn and team,

Here is the first of two salvia enquiries for your input/approval by 3pm today, if possible as this is due at 4. Proposed responses have been drafted from previous enquiries.

Thanks in advance.

Nicole

**Q1) is it legal?**

A1)

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore activities with it are not considered illegal in Canada. Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the CDSA is warranted. However, because *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as such. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

~~Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

~~Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.~~

**Q2) Is it a concern for HC?**

appeal  
Monsieur  
in use  
particularly  
in youth

A2) Health Canada is concerned about the increased use, abuse potential and unknown effects of *Salvia divinorum*. ~~As a result, Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.~~

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**Q3) Is it considered a drug?**

A3) Products containing *Salvia divinorum* meet the definition of a Natural Health Product when they are marketed for use for their hallucinogenic properties. Natural Health Products are a category of health products which are regulated under the *Food and Drugs Act*. ~~However, unless *Salvia divinorum* is marketed with a health claim it would not necessarily be considered a drug per se as defined in the *Food and Drugs Act*.~~ *not, however*

~~*Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.~~

~~Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.~~

~~Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~These include:-~~

- ~~— Overall risk to public health and safety posed by the substance.~~
- ~~— Chemical and pharmacological similarity to other substances already regulated under the CDSA;~~
- ~~— Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~— Potential for abuse and risk of addiction associated with the substance;~~
- ~~— Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~— International requirements and trends in international control.~~

Subject: Fw: Media enquiry - Global National - Salvia

Hi Jocelyn and team,

Here is the first of two salvia enquiries for your input/approval by 3pm today, if possible as this is due at 4. Proposed responses have been drafted from previous enquiries.

Thanks in advance.  
Nicole

**Q1) is it legal?**

~~A1) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

When products containing *Salvia divinorum* and/or its main active ingredient salvinorin A are sold for the purposes of modifying brain function (such as for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Q2) Is it a concern for HC?**

~~A2) Health Canada is aware of *Salvia divinorum* and has noted media interest regarding the availability of~~

concerned about . . . .  
per discuss 002016

this plant ~~Salvia divinorum~~ in Canada.

Health Canada ~~will continue to collect and study information about Salvia divinorum as it becomes available~~ and is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**Q3) Is it considered a drug?**

A3) (See A1)

~~Salvia divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia divinorum, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.~~

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

~~Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~These include:-~~

- ~~• Overall risk to public health and safety posed by the substance.~~
- ~~• Chemical and pharmacological similarity to other substances already regulated under the CDSA.~~
- ~~• Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~• Potential for abuse and risk of addiction associated with the substance;~~
- ~~• Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~• International requirements and trends in international control.~~

• meets definition of an NHP, which is a category of health products regulated under the Food and Drugs Act but ~~not~~ ~~which~~ it ~~is~~ ~~already~~ is ~~not~~ a ~~drug~~ ~~per se~~ as defined in the Food and Drugs Act per se.

Subject: Fw: Media enquiry - Global National - Salvia

Hi Jocelyn and team,

Here is the first of two salvia enquiries for your input/approval by 3pm today, if possible as this is due at 4. Proposed responses have been drafted from previous enquiries.

Thanks in advance.

Nicole

**Q1) is it legal?**

A1)

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore activities with it are not considered illegal in Canada. Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the CDSA is warranted. However, because *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as such. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

~~Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be~~

~~referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

~~Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.~~

**Q2) Is it a concern for HC?**

A2) Health Canada is concerned about the apparent increased use of *Salvia divinorum*, particularly by youth.

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**Q3) Is it considered a drug?**

A3) Products containing *Salvia divinorum* meet the definition of a Natural Health Product when they are marketed for use for their hallucinogenic properties. Natural Health Products are a category of health products which are regulated under the *Food and Drugs Act*. *Salvia divinorum* is not, however, considered a drug per se as defined in the *Food and Drugs Act*.

~~*Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.~~

~~Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.~~

~~Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~These include:-~~

- ~~• Overall risk to public health and safety posed by the substance.~~
- ~~• Chemical and pharmacological similarity to other substances already regulated under the CDSA;~~
- ~~• Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~• Potential for abuse and risk of addiction associated with the substance;~~
- ~~• Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~• International requirements and trends in international control.~~

---

Hi Jocelyn and team,

Here is the first of two salvia enquiries for your input/approval by 3pm today, if possible as this is due at 4. Proposed responses have been drafted from previous enquiries.

Thanks in advance.  
Nicole

**Q1) is it legal?**

~~A1) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

When products containing *Salvia divinorum* and/or its main active ingredient salvinorin A are sold for the purposes of modifying brain function (such as for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Q2) Is it a concern for HC?**

A2) Health Canada is aware of *Salvia divinorum* and has noted media interest regarding the availability of this plant ~~Salvia divinorum~~ in Canada.

Health Canada will continue to collect and study information about *Salvia divinorum* as it becomes

available and is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**Q3) Is it considered a drug?**

A3) (See A1) ~~NS~~

~~When salvia products are sold for the purposes of modifying organic function (such as, for their hallucinogenic effect), they meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.~~

~~*Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.~~

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

~~Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~These include:-~~

- ~~• Overall risk to public health and safety posed by the substance.~~
- ~~• Chemical and pharmacological similarity to other substances already regulated under the CDSA;~~
- ~~• Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~• Potential for abuse and risk of addiction associated with the substance;~~
- ~~• Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~• International requirements and trends in international control.~~

Subject: Re: URGENT: Media enquiry - CTV - salvia

Hi Jocelyn,

Salvia media request # 3 for your review.

Q1) Is it approved by HC or not? Is it legal? Banned?

A1) The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore activities with it are not considered illegal in Canada. Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the CDSA is warranted. However, because *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as such. The sale of unauthorized natural health products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Nicole Prentice

Hi again,

Here is the second media enquiry for your input/approval, hopefully by 3:30pm today. This is due asap. Again, proposed responses have been taken from previous enquiries.

Thanks in advance.  
Nicole

**Q1) What has HC learned about how Salvia is used by Canadians?**

A1)

Recently there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *Salvia divinorum* as a "legal" alternative to street drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *Salvia divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15 year olds have used *Salvia divinorum* in the past year.

Health Canada does not recommend the use of products containing *S. divinorum* and/or its main active ingredient salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

~~Health Canada is aware of salvia and has noted media interest regarding the availability of *Salvia divinorum* in Canada.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health~~

~~products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

Q2) How does HC classify Salvia?

- ① A2) The plant *Salvia divinorum* is not controlled under the *Controlled Drugs and Substances Act* (CDSA) and therefore ~~is~~ not considered illegal in Canada. ~~However, *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any Natural Health Product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~
- ② Health Canada is currently assessing whether the regulation of ~~*Salvia divinorum* and/or salvinorin A~~ under the CDSA is warranted.

~~Health Canada is currently reviewing all the available information regarding *Salvia divinorum*, including the prevalence of its use in Canada, to determine whether regulation of *Salvia divinorum* under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~A controlled substance is any type of drug that the federal government has categorized as having a higher than average potential for abuse or addiction. Such drugs are divided into categories based on their potential for abuse or addiction. Controlled substances range from illegal street drugs to prescription medications.~~

~~Health Canada considers several factors in determining whether regulation of a substance under the CDSA is warranted.~~

~~These include:-~~

- ~~• Overall risk to public health and safety posed by the substance.~~
- ~~• Chemical and pharmacological similarity to other substances already regulated under the CDSA;~~
- ~~• Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~• Potential for abuse and risk of addiction associated with the substance;~~
- ~~• Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~• International requirements and trends in international control.~~

**Q1) What has HC learned about how Salvia is used by Canadians?**

A1)

Recently there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* for its hallucinogenic properties. Certain websites are also promoting the use of *Salvia divinorum* as a "legal" alternative to street drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *Salvia divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15 year olds have used *Salvia divinorum* in the past year.

Health Canada does not recommend the use of products containing *S. divinorum* and/or its main active ingredient salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

~~Health Canada is aware of salvia and has noted media interest regarding the availability of *Salvia divinorum* in Canada.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement~~

~~action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

**Q2) How does HC classify Salvia?**

A2) The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore activities with it are not considered illegal in Canada. Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the CDSA is warranted. However, because *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as such. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

~~Health Canada is currently reviewing all the available information regarding *Salvia divinorum*,, including the prevalence of its use in Canada, to determine whether regulation of *Salvia divinorum* under the *Controlled Drugs and Substances Act* (CDSA) is warranted.~~

~~A controlled substance is any type of drug that the federal government has categorized as having a higher than average potential for abuse or addiction. Such drugs are divided into categories based on their potential for abuse or addiction. Controlled substances range from illegal street drugs to prescription medications.~~

~~Health Canada considers several factors in determining whether regulation of a substance under the CDSA is warranted.~~

~~These include:-~~

- ~~• Overall risk to public health and safety posed by the substance.~~
- ~~• Chemical and pharmacological similarity to other substances already regulated under the CDSA;~~
- ~~• Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);~~
- ~~• Potential for abuse and risk of addiction associated with the substance;~~
- ~~• Extent of actual abuse of the substance in Canada and internationally; and~~
- ~~• International requirements and trends in international control.~~

Miley Cyrus smokes it, but Health Canada warns against use of 'Magic Mint'

# Miley Cyrus smokes it, but Health Canada warns against use of 'Magic Mint'

## Pop star piques interest in legal hallucinogen

BY RANDY SHORE, POSTMEDIA NEWS DECEMBER 16, 2010 8:11 AM

Health Canada is warning people to avoid using the hallucinogenic Mexican herb *Salvia divinorum* -- made famous in a Internet video showing pop star Miley Cyrus smoking the stuff -- until its effects are better understood.

Native to Oaxaca, Mexico, the plant known as Magic Mint or Seer's Sage has been used for centuries by Mazatec Indian shamans for medicinal purposes and to induce visions, but has also gained a foothold in Canada and the U.S. as a recreational drug.

*Salvia divinorum* is not illegal in Canada, but the herb has been under study by the national health agency since at least 2006 to determine whether it should be regulated under the Controlled Drug and Substance Act.

Health Canada warns that products containing *Salvia divinorum* or its extracts may violate the Food and Drugs Act, said agency spokesman Stephane Shank. Natural health products must be reviewed by Health Canada and approved for sale; so far no *Salvia* products have been approved.

Fortified *Salvia* is sold at head shops and some corner stores in a marijuana-like smokable form as well as in alcohol-based tinctures.

In its more potent forms, a few seconds of smoking *Salvia* induces intense, debilitating hallucinations that may last from 15 to 30 minutes, according to experienced users who responded to the Vancouver Sun.

"It's not even comparable to marijuana. I could not see, move or speak. I thought I had died and gone to hell," wrote a woman identified only as Betty C. "I could not remember my name, what I looked like, what species I was. I felt nothing but fear."

Interest in *Salvia* intensified late last week when a videotape leaked on the Internet showed pop star Miley Cyrus laughing and hallucinating after smoking the herb through a large plastic pipe.

YouTube contains dozens of videos of teens who enter a state of total disorientation and panic after smoking *Salvia divinorum*.

"What the video will do is raise awareness of this drug and that may lead to more people experimenting with it and raise demand and profits for legitimate and illegitimate enterprises," said Robert Gordon,

Miley Cyrus smokes it, but Health Canada warns against use of 'Magic Mint'

director of Simon Fraser University's School of Criminology.

U.S. media reports suggest that sales of the herb have tripled in some states since the Miley Cyrus video was released. But Salvia is banned in 15 states, including Delaware, where the herb was blamed in the 2006 suicide of 16-year-old Brett Chidester.

A 24-year-old man convicted of raping and killing a mother of five on Calgary's C-Train in 2008 claimed to have been drinking and smoking Salvia beforehand. The court ruled that Christopher Watcheston was not so intoxicated that he didn't know what he was doing.

A 2009 drug-and alcohol-use survey conducted by Health Canada found that 0.5 per cent of adults have tried the herb, compared to 7.3 per cent of youth aged 15 to 24.

Draft V.2

Response to Docket # 10-008895-624

To: [Redacted]

Dear [Redacted]

I am writing in response to your email enquiry dated December 14, 2010 concerning the legal status of *Salvia divinorum*.

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned", nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*, when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any Natural Health Product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

authorized

does

It is, however, illegal to sell *Salvia* products if they are specifically marketed for use as hallucinogens.

However, when *Salvia* products are specifically marketed as hallucinogens, they are in

violation

Nonetheless, when specifically marketed for its hallucinogenic properties, *S. Divinorum* meets

Jocelyn Kula to: Christine Roush

2010-12-17 05:22 PM

Cc: Nicole Prentice, Chantal Routhier-Garner, Denis Arsenault, Stephanie Chandler, Suzanne Desjardins

Building on Suzanne's input. Approved for OCS:

**1) Is salvia legal to take in Canada? Is salvia legal to sell in Canada? Has Health Canada Approved the sale of the drug? Is it classified as a banned substance?**

~~A1) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties ~~when consumed by humans~~, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any ~~Natural Health Product~~ which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

**2) Given the negative effects of side effects, why doesn't HC stop the sale of salvia? If it is illegal then why is it readily available? Why isn't there a greater push to enforce (a ban) the substance?**

A2) Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**3) Since when has Health Canada been studying salvia?**

A3) Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* were ~~have been~~ included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. In addition, questions regarding the use of *Salvia divinorum* in the general population were ~~have also been~~ included in the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the data released in July 2010. ~~The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available. (URL:~~

<http://www.hc-sc.gc.ca/hc-ps/drugs-drogues/stat/index-eng.php>)

**4) What are your reactions to the Saskatchewan radio DJ openly getting high off salvia on his radio show today?**

A4) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**5) How many complaints has Health Canada received about the substance?**

A5) Health Canada has not received any complaints about this substance. [Could also include the line from past media responses re the four adverse reactions, as long as you also include the caveat about how one can't extrapolate from this because the number is so small....]

**6) Has anyone died from taking the substance?**

A6) We are not aware of a death having occurred in Canada as an immediate consequence of the use of the drug.

2010-12-17 3:05:04 PM (Gary Holub)

Here are the questions I have. HC refers to Health Canada.

- 1) Is salvia legal to take in Canada?
- 2) Is salvia legal to sell in Canada?
- 3) Is it classified as a banned substance?
- 4) Given the negative effects of side effects, why doesn't HC stop the sale of salvia?
- 5) Since when has Health Canada been studying salvia?
- 6) Has Health Canada Approved the sale of the drug?
- 7) If it is illegal then why is it readily available? Why isn't there a greater push to enforce the substance?
- 8) What are your reactions to the Saskatchewan radio DJ openly getting high off salvia on his radio show today?
- 9) How many complaints has Health Canada received about the substance?
- 10) Has anyone died from taking the substance?

If you could get back to me by 4 Eastern that would be terrific!

DRAFT 14  
December 17, 2010

## Media Lines *Salvia divinorum*

### Issue

Further to ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties, Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA), in order to protect the health and safety of Canadians, particularly youth.

### Key Messages:

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A and is proposing to regulate both substances under the CDSA, in order to protect the health and safety of Canadians, particularly youth.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with <sup>the</sup> their ready availability, apparent increased ~~use and~~ abuse and the unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

### Supplementary Messages:

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of <sup>may</sup> their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A <sup>may</sup> meet the definition of a natural health product (NHP) under the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- As *S. divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as such. The unauthorized sale of products containing *S. divinorum* and/or

a hallucinogen.

salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

### Questions and Answers:

#### **Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### **Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, apparent increased use and abuse and their unknown effects. <sup>of these substances</sup> The scheduling of *S. divinorum* and salvinorin A will also eliminate the perception that these substances are safe since they are not illegal.

#### **Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada intends to include *S. divinorum* and salvinorin A under one of the Schedules to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of

exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *S. divinorum* meets the definition of a Natural Health Product (NHP) under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale.

**Q4 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A4 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *S. divinorum*. When *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, it will be illegal to possess, import, export, produce and distribute these substances in any form unless authorized by regulation. Law enforcement agencies will then be able to take appropriate action in response to such illegal activities.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *S. divinorum* and salvinorin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *S. divinorum*; and
- the use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

DRAFT 14  
December 17, 2010

**Media Lines**  
*Salvia divinorum*

**Issue**

Ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggest that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA), in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada has concluded its assessment of *S. divinorum* and salvinorin A, and is proposing to regulate both substances under the CDSA in order to protect the health and safety of Canadians, particularly youth.
- The inclusion of *S. divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with the ready availability, apparent increased ~~use~~ and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).
- Health Canada will inform stakeholders of its decision by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate these substances as controlled substances.

use of...

its main active ingredient

proposal

salvia divinorum and salvinorin A

**Supplementary Messages:**

- Canadians should not use products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A may meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- As *S. divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The unauthorized sale of products containing *S. divinorum*

and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*,

**Questions and Answers:**

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions, and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

as a result, they

The move to include *S. divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with the ready availability, apparent increased use and abuse and unknown effects of these substances. The scheduling of *S. divinorum* and salvinorin A will also eliminate the current perception that these substances are safe since they are not presently illegal.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15 year olds have used *S. divinorum* in the past year.

can we formulate this another way?

Cc: Jocelyn Kula, Nicole Prentice, CSTD-DGO, CSTD-OCS-DO, Denis Arsenault, Stephanie Chandler, Judith O'Brien, Jesse Arnup-Blondin

Hello Cathy,

We are sending CBC tonight the statement below that was sent to Global and CTV earlier in the week. We have told CBC we will follow up with them on Monday with answers to the rest of the questions.

Jocelyn - I just need a response to Q5, as Suzanne has already provided her input.

### HC Statement on Salvia

Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

Hi Jocelyn,

No need to rejig the responses to Q1 and Q2 -- these are recently approved and the "good to go"

s.19(1)

language from Cathy for recent inquiries. This came up earlier this week following the Miley Cyrus coverage -- it was determined this block of language in bold below would be the standard -- already approved. Give me a call if you want more explanation. S

**Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.**

To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.

It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or Salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**Many think salvia should be banned**

DAN MATHESON: Before Miley Cyrus ended up on the internet smoking a bong, many people had never heard of salvia. But the pop star celebrated her 18th birthday by smoking the stuff, which is technically legal, but it can cause powerful hallucinations, and there are many who think it should be banned. CTV's Omar Sachedina on what the buzz is all about.

OMAR SACHEDINA (Reporter): The performance isn't among her finest, former Disney star Miley Cyrus caught on tape using a bong to smoke salvia, a hallucinogenic drug derived from a plant native to southern Mexico.

UNIDENTIFIED WOMAN: He has inhaled it, he's holding it in.

SACHEDINA: Saskatoon disc jockey Ryder experienced a salvia high live on his radio show.

DJ RYDER (Radio Disc Jockey): This is really hard core.

SACHEDINA: An instant high he describes as downright frightening.

RYDER: So hot right now. God.

SACHEDINA: Which is exactly the side of the drug Rider said his listeners needed to know about, and why he decided to smoke the substance on air.

RYDER: Miley glorifying it, especially to that young audience, really scared us, and it was an immediate problem that we felt needed an immediate answer, and we knew this would be a big one.

SACHEDINA: What surprises many people is how easy it is to get salvia. Just walk into a store and pay, a gram costing about \$20 to \$80 depending on the potency. Salvia is not approved for sale by Health Canada, but it isn't classified as a banned substance under the criminal code either, which leaves the drug in legal limbo.

CASSIE WALDI: I'm lucky to be alive.

SACHEDINA: Cassie Waldi's experience with the drug almost killed her. Jumping from the window of this building after smoking salvia, Waldi knocked out several teeth. Doctors even forced to stitch up her fractured jaw.

WALDI: I woke up outside on pavement three storey's down screaming. SACHEDINA: A horrific trip, but the exception, say those who sell salvia.

REBECCA AMBROSE (Vancouver Seed Bank): She is an adult legally. So, I mean, she is allowed to make her own choices.

SACHEDINA: Like Miley Cyrus did when she became legal, celebrating with salvia on her 18th birthday, tripling sales of the drug and also lighting up the controversy surrounding it. Omar Sachedina, CTV News, Toronto.

MATHESON: And that's our program for this Friday, December the 17th. I'm Dan Matheson. For Lloyd Robertson and everyone that works here at CTV News, have a great night. For many of you, your local CTV news is next.

DRAFT 14  
December 20, 2010

**Media Lines**  
***Salvia divinorum***

**Issue**

Ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggest that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada has concluded its assessment of *Salvia divinorum* and its main active ingredient salvinorin A and is proposing to regulate both substances under the CDSA in order to protect the health and safety of Canadians, particularly youth.
- The inclusion of *Salvia divinorum* and salvinorin A in one of the Schedules to the CDSA will reduce the potential health and safety risks associated with the ready availability, apparent increased use and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).
- Health Canada will inform stakeholders of its proposal by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- Because of their hallucinogenic properties, products containing *Salvia divinorum* and/or salvinorin A may meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- As *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The unauthorized sale of such products containing *Salvia*

*divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

#### Questions and Answers:

#### **Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in one of the Schedules to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. It is also consistent with the fact that some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

#### **Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in one of the Schedules to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with the ready availability, apparent increased use and abuse and unknown effects of these substances. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are safe since they are not presently illegal.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians age 15 and older reported having used *Salvia divinorum* at least once in their lifetime. Youth, ages 15-24, were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15 year olds have used *Salvia divinorum* in the past year.

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under one of the Schedules to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The unauthorized sale of such products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in one of the Schedules to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

It is illegal to sell NHPs in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN).

---

Page 3: [2] Deleted STCHANDL 2010-12-08 9:51:00 AM

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

██████████ A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

Re: Salvia IAS

Hi Jocelyn,

This is the latest version of the IAS which incorporates your comments as well as some additional information from CSS-WG (re: Salvia at the border). It has been reviewed by Denis and is ready for your review. However, as the IAS will be updated according to comments from the NOI, I'm unsure as to at what stage approval should take place. The CSS-WG would also like to see a copy after NOI comments have been incorporated.

Draft Salvia Divinorum IAS\_Dec 6 2010.doc

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by youth specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extracts and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or marketed as a hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now the Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products that contain *S. divinorum* and are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

As of October 2010, no products containing *S. divinorum* have been authorized by Health Canada. Therefore no NPNs or DIN-HMs have been issued for such products. Therefore sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, or industrial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### **4.2 Assessment of *S. Divinorum* for Scheduling Purposes**

##### **4.2.1 International Requirements and Trends in Control and/or Scheduling**

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### ***Australia***

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of

Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high potential for abuse and risk to public health and safety."<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "*Tabella 1*" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years

---

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marihuana.

At the state level, some state legislatures have implemented laws restricting the use, sale and/or distribution of *S. divinorum* and/or salvinorin A. As of July 2010, a number of states have placed regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

#### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human

consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> As a diterpene, salvinorin A is part of a family of substances that contain terpenoids. Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid

---

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

(KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

<sup>18</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>25</sup>

#### 4.2.3 Legitimate Use of the Substance (Therapeutic, Scientific, Industrial)

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches,

rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its psychedelic properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder, there has been no clinical research to support these hypotheses.<sup>30</sup> There are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for “recreational” purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by MOR agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of

MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse.

In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of

dried leaves only yield 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms has profound hallucinogenic effects.<sup>41</sup> Given that only small doses of this substance are now necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.\*

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and

---

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdès LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

\* It should be noted that in some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia" within the survey question.

- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. In conclusion, 'salvia' appears to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, the annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only be seized accidentally or during the seizure of other controlled substances.

Between 2003 and 2009, the Border Integrity Unit of the Health Products and Food Branch Inspectorate (HPFBI) reported that a total of 26 (23 refused, 3 released) records of imports and attempted imports of *Salvia divinorum* products in their databases. These records represent British Columbia and Ontario only. Data for other provinces is not available. However, the practice of recording imports has since been replaced by a national database in which only refused shipments are tracked. As of November 2010, there is no record of a refused shipment of *Salvia divinorum* in the national database. This may reflect decreased volume of incoming shipments, decreased referral of such shipments by Canada Border Services Agency (CBSA), or adaptation by importers/sellers to import requirements (e.g. labelling as incense).

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Administration (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as neither substance is listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a

hallucinogen is on the rise. However, it may also reflect an increased awareness of the phenomenon, rather than an increased incidence of use.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

---

<sup>43</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>44</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

<sup>46</sup> Singh S. (2007) Adolescent salvia substance abuse. Addiction. 102, 823-824.

<sup>47</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

## 5. ASSESSMENT OF RISKS AND BENEFITS

## 6. IDENTIFICATION AND ANALYSIS OF OPTIONS

<sup>48</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also

s.21(1)(a)

s.21(1)(b)

considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of use, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore the use of salvinorin A poses the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

## 8. RECOMMENDATIONS

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue Analysis Summary, the CSS-WG recommended that *S. divinorum* be included under Schedule III to the CDSA.

Hi Robin,

I am just wondering if you have any updates with regards to when we will be receiving the HPFB / NHPD list of stakeholders with regard to the Salvia NOI. We are hoping to publish the NOI in January, so we'd like to be able to compile the list of stakeholders ASAP.

Thanks,

Stephanie

---

Hi Tiffany,

Neither Denis nor myself has received any stakeholder information from members of the CSS-WG re: the Salvia NOI. Just wondering if you have received anything? We are hoping to publish the NOI in January, so we would appreciate this info ASAP.

Thanks,

Stephanie

2010-12-22 11:29 AM

Hi Robin and Courtney,

Just a reminder to send your stakeholder list to Stephanie Chandler regarding those who should be notified of the NOI. They would like to send out the NOI some time in January so if you could provide the list in the next couple of weeks that would be helpful.

Thanks,  
Tiffany

Health Risk Assessment of Salvia divinorum as a Health Product 2010-08-25.doc

Salvia divinorum IAS 2006-11-03.doc

At the last CSS-WG meeting we reviewed the deck "Scheduling Substances under the *Controlled Drugs and Substances Act*". On slide 7, I pointed out that "morning glory" was identified as a plant with psychoactive properties but that may be a bit misleading because the psychoactive species are not the common morning glory that people have in their gardens. I promised I would provide details by e-mail.

The psychoactive "morning glory" plant, species name *Turbina corymbosa* (L.) Raf., Convolvulaceae, widely published synonym *Rivea corymbosa* (L.) Hallier f., is better known in the scientific literature by its Mexican Nahuatl name of "Ololiuqui". Horticulturally it has the English common names "Christmaspops" or "Christmasvine." The seeds were consumed in water traditionally by the Mexican Chinotec, Mazatec, Mixtec and Zapotec peoples as a narcotic hallucinogen for purposes of divination by traditional healers. Hallucinations occur during the somnambulistic stage of intoxication.

The psychoactive properties are due to biosynthesis of ergoline alkaloids by fungi of the order Clavicipitales (related to ergot) that colonize the adaxial (upper) leaf surface and seeds of certain members of the morning glory family, especially *Turbina corymbosa* and *Ipomoea asarifolia*. A closely related fungus is found on *Ipomoea violacea*. The fungus-derived ergoline alkaloids: chanoclavine, lysergic acid-alpha-hydroxyethylamide, lysergic acid amide, and ergonovine, accumulate in the leaves and seeds of the host plant. The fungi are seed-transmitted to the next generation of plants.

The common garden morning glory is *Ipomoea purpurea* (L.) Roth. Additional horticultural species include *I. pes-caprae*, *I. pandurata*, *I. carnea*, *I. cairica*, *I. quamoclit*, *I. tricolor*, *I. hederifolia*, *I. nil*, *I. aquatica*, *Convolvulus tricolor*, *Argyrea nervosa*, and *Merremia tuberosa*. The wild morning glory or bindweed plants that infest our gardens as noxious weeds are *Convolvulus arvensis* L. (small-flowered) and *Calystegia sepium* (L.) R.Br. (greater bindweed).

Markert et al ergoline alkaloids fungi and Convolvulaceae.pdf

History: This message has been replied to.

---

Hi Stephanie,

Below is an example of a message we recently issued regarding some changes to the scheduling of certain NHP ingredients. This was sent to NHPD's Stakeholder list, which primarily includes applicants, however also includes industry members, pharmacists who are interested in receiving this type of information.

Please let me know if you need anything else.

Thanks

October 21, 2010

**Re: Update on the Assessment of Naturally-Sourced Medicinal Ingredients found on Schedule F**

Dear Stakeholders,

In March 2009 Health Canada announced that it would be undertaking the scientific assessment of a number of naturally-sourced substances currently listed in Schedule F to the *Food and Drug Regulations*. The purpose of this initiative was to determine which of these substances should remain unchanged, be modified, or removed entirely from the Schedule. Health Canada followed up this announcement with an update in December 2009

(  
[http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/notice-avis\\_schedulef\\_annexef-dec2009-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/notice-avis_schedulef_annexef-dec2009-eng.php)).

This message is to provide *an update on* this initiative:

**1) Four (4) medicinal ingredients proposed for removal from Schedule F: apiol oil, centella asiatica extract and active principles thereof, deanol and its salts and derivatives, and theobromine and its salts.**

Targeting consideration by Treasury Board Ministers for final publication in the *Canada Gazette*, Part II in January/February 2011.

**2) Six (6) medicinal ingredients proposed to remain on Schedule F with qualifiers: dopamine and its salts, gold and its salts, uracil and its salts, dimethyl sulfoxide, levocarnitine, and l-tryptophan.**

Prescription status for specific strengths, uses, routes of administration or dosages.

Targeting consideration by Treasury Board Ministers for final publication in the *Canada Gazette*, Part II in February/March 2011.

**3) Lovastatin**

Moving forward as its own regulatory package.

Health Canada is reviewing comments received further to the Notice of Intent and undertaking further internal analysis.

Further updates will be provided when appropriate.

Respectfully,

The Natural Health Products Directorate  
Health Canada

Subject: Re: Fw: CSS-WG Stakeholders for Salvia NOI

---

Hi Sara,

The Notice of Intent is published in the Canada Gazette, but we will send a letter to stakeholders indicating that the NOI has been published and include a link to the document. In this Office the majority of our stakeholders will be contacted by email unless we don't have an email on file for them. While email is the preferred method of contact, if this option isn't available we could mail or fax.

Let me know if you have any other questions.

Stephanie

DRAFT 14  
December 22, 2010

**Media Lines**  
**Salvia divinorum**

**Issue**

Ongoing media interest regarding the availability of *Salvia divinorum* in Canada and reports from scientific and media sources suggest that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada has concluded its assessment of *Salvia divinorum* and its main active ingredient salvinorin A and is proposing to regulate both substances under the CDSA in order to protect the health and safety of Canadians, particularly youth.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities would be prohibited unless authorized by regulation: possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).
- Health Canada will inform stakeholders of its proposal by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.
- As *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The unauthorized sale of such products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

Formatted: Font: Bold

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

Formatted: Level 1, Tabs: 1.27 cm, Left

**Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Formatted: Bullets and Numbering

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, increased use and unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Formatted: Font: Italic

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

Deleted: t

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The unauthorized sale of such products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum***

A - Health Canada is developing an It's Your Health article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

***Salvia divinorum as a controlled substance:***

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).

Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and thus, do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia*

*divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act* in the United States.

STCHANDL

2010-12-08 9:51:00 AM

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada is currently reviewing the available information to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

██████████ A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to fully characterize the risk of similar reactions among the general population

*Not very well done*

## BACKGROUND - CONTEXTE

English:

### BACKGROUND / CONTEXTE

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are

also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have both physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

not in the medicinal lines?

Pls see medicinal lines p. 10. Canada?

Neither

International Control of *S. divinorum*

At the present time, *S. divinorum* and its main active ingredient salvinorin A are not listed under the United Nations Drug Control Conventions which means that they are not required to be regulated as a controlled substances in any of the countries that are signatories to these Conventions. However, some countries have decided to control *S. divinorum* and/or salvinorin A on their own. In Australia, Belgium, Denmark, Sweden, and SouthNorth Korea, the possession and sale of *S. divinorum* is illegal. In Spain, the sale of *S. divinorum* is prohibited, but possession or use is not. In Norway, *S. divinorum* cannot be imported without a prescription, and in Japan has recently passed a law that will take effect in April 2007 which totally bans all activities with salvinorin A have been banned. In the United States, neither *S. divinorum* nor salvinorin A are regulated as controlled substances by the US Drug Enforcement Administration; however, although some states such as Missouri, Louisiana, Tennessee and Delaware have implemented laws restricting the use, sale and/or distribution of one or both substances.

? Finland? Germany?

Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under is currently completing a review of *Salvia divinorum* against the criteria considered in adding substances to one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under drugs listed in the CDSA;
- Dependence potential; Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.
- Likelihood of abuse/misuse;
- Extent of abuse/misuse in Canada;
- Danger to public health and safety; and,
- Legitimate use in Canada

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

Once this work has been completed, Health Canada will inform stakeholders of its decision. A regulatory proposal will be developed in the coming months.

The plant *S. divinorum* is not currently regulated under the CDSA and therefore the plant is not considered to be "banned", nor are activities with it considered to be illegal in Canada. Nevertheless, when specifically marketed for its hallucinogenic properties, *S. divinorum* meets the definition of a natural health product in accordance with under the *Natural Health Products Regulations*. To date, however, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter

- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any Natural Health Product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* .

HT  
DRAFT V.7

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

Notice to interested parties - Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

This notice provides interested stakeholders with the opportunity to provide ~~preliminary~~ comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as LSD and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

shld this be spelled out 1st?

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

<sup>1</sup>Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The control of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. ~~There will be additional opportunities to provide comments following prepublication of the scheduling proposal in Canada Gazette, Part I.~~

*as the regulatory process progresses.*

*can it be more generic*

If you are ~~interested in this process or~~ have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Update of scheduling status of Salvia under the CDSA

REQUEST - DEMANDE (YYYY-MM-DD)

(1)Date: 2010-12-20

HECSB LEAD:

MO has requested a verbal briefing on the scheduling status of Salvia under the CDSA (Controlled Drugs and Substances Act). The verbal briefing has been scheduled to take place on Tuesday, December 21, 2010 at 4:00 PM 1:00 PM in the MO Boardroom. MO staff in attendance include: Leah Canning, Clarke Olsen and Carly Wolff.

Please provide the names, phone numbers (for the participant and his/her EA, if applicable), and titles of departmental official(s) (at DG level or higher) who will be attending this meeting via email by 10:00 AM on Tuesday, December 21, 2010. Lead branch to send up to three participants maximum (must include rationale on why three participants are required).

Please forward any material that will be presented at this meeting via email to MBU by 2:00 PM on Tuesday, December 21, 2010 to allow sufficient time for MO review prior to the meeting

Following the meeting, HECSB, please ensure that a debrief is prepared for the MO participants, outlining the salient points that were raised and any action to be taken by your sector. Please use the appropriate template that is attached in the MECS Tips & Samples section. Please ensure that the debrief is approved by, and sent from, your ADMO via email by noon on December 24, 2010 to Sandra Rose Roy, copying Lisa Whittleton and Jennifer Kuyek and adding the document to the attachments in MECS.

Please copy MBU Services UIM on any email regarding this request to ensure that your message reaches all concerned.

**Debrief of Internal Meeting with the Minister's Office**  
*Salvia Divinorum*

**Purpose of the meeting:**

Verbal Briefing regarding scheduling status of Salvia under the CDSA

**Date and time of the meeting:**

December 21, 2010

1:00 PM

**Minister's staff present at the meeting:**

Carly Wolff

Clarke Olsen

Carlo Oliviero

**Names of Portfolio participants and their titles:**

Cathy Sabiston, DG, Controlled Substances and Tobacco Directorate, HECSB

Jocelyn Kula, A/Director, Office of Controlled Substances, CSTD, HECSB

Robin Marles, Director, Bureau of Clinical Trials and Health Sciences, Natural Health Products Directorate, HPFB

Victoria Anderson-Selst, Senior Advisor, HPFB ADMO

**DMO representative:**

Ian Hobler, Policy Advisor

s.21(1)(a)

s.21(1)(b)

**High-level issues raised:**

Departmental officials provided a general overview of *Salvia divinorum*, in the context of the *Controlled Drugs and Substances Act* and the *Natural Health Products Regulations*.

**Branch Head:** Paul Glover  
**Telephone:** 613-946-6701  
**Date:** December 23, 2010

**s.21(1)(a)**  
**s.21(1)(b)**

### **Summary of Surveillance Data Supporting the Scheduling of Salvia under the CDSA**

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## Overview of Schedules to the *Controlled Drugs and Substances Act* and Applicable Penalties

The substances regulated under the CDSA are grouped into six of the eight Schedules (Schedules I to VI) to the Act. Schedules I to V list controlled substances while Schedule VI lists precursor chemicals. Schedule VII provides the threshold quantities for trafficking offences involving cannabis and cannabis resin. Schedule VIII provides the threshold quantities for possession offences involving cannabis and cannabis resin.

The following table provides examples of the substances included in the different Schedules to the CDSA:

Schedule	Examples of Substances Included
I	Opium, coca, morphine, fentanyls, other substances like methamphetamine (meth is not a narcotic)
II	Cannabis, its preparations, derivatives and synthetic preparations
III	Amphetamines, methylphenidate, mescaline, 4-hydroxybutanoic acid (GHB)
IV	Barbiturates, benzodiazepines, anabolic steroids
V	Propylhexedrine
VI	Pseudoephedrine, acetone, hydriodic acid

Each Schedule to the CDSA is associated with particular offences and punishments described in Part I of the Act. Offences associated with substances in Schedule I, II or III include illegal (or unauthorized) possession, trafficking, possession for the purposes of trafficking, importation and exportation, possession for the purposes of exportation, and production. The offences associated with substances in Schedule IV are similar to those associated with substances in Schedule I, II or III except that there is no criminal offence for simple possession. The offences associated with substances in Schedules V and VI are limited to illegal importation, exportation and possession for the purposes of exportation.

The CDSA also prohibits double doctoring, i.e., seeking or obtaining, or seeking or obtaining authorization to obtain, any substance included in Schedule I, II, III or IV from a practitioner without disclosing the particulars relating to the acquisition or authorization to obtain such a substance from any other practitioner within the past 30 days.

For the most part, the offences in the CDSA are *hybrid* which means they can be prosecuted either by *summary conviction (summary conviction offences)* or *indictment (indictable offences)*, as chosen by the Crown. *Summary conviction offences* encompass the most minor offences in the CDSA. Unless a different penalty is specified in the CDSA, *summary conviction offences* are all punishable by a fine of up to \$2,000 and/or six months imprisonment. Appendix I outlines the current maximum penalties applicable when a person is found guilty of a *summary conviction offence* as described in Part I of the Act.

*Indictable offences* are more serious than summary conviction offences. Conviction of an *indictable offence* exposes the accused to greater penalties. Appendix II outlines the current maximum penalties applicable when a person is found guilty of an *indictable offence* as described in Part I of the Act.

**Appendix I:**

Maximum penalties for a person found guilty of an offence prosecuted by *summary conviction* associated with each Schedule to the CDSA, as described in Part I of the Act

Schedule	Type of Offence	OFFENCE						
		Simple Possession 4(1)	Double Doctoring 4(2)	Trafficking 5(1)	Possession for the purpose of trafficking 5(2)	Importing and exporting 6(1)	Possession for the purpose of exporting 6(2)	Production 7(1)
I	First Offence	Fine up to \$1,000, or up to 6 months imprisonment, or both	Fine up to \$1,000, or up to 6 months imprisonment, or both					
	Subsequent Offence	Fine up to \$2,000, or up to 1 year imprisonment, or both	Fine up to \$2,000, or up to 1 year imprisonment, or both					
II	First Offence	Fine up to \$1,000, or up to 6 months imprisonment, or both	Fine up to \$1,000, or up to 6 months imprisonment, or both					
	Subsequent Offence	Fine up to \$2,000, or up to 1 year imprisonment, or both (Not applicable for Schedule VIII (marihuana, 30G, cannabis resin, 1G))	Fine up to \$2,000, or up to 1 year imprisonment, or both					
III	First Offence	Fine up to \$1,000, or up to 6 months imprisonment, or both	Fine up to \$1,000, or up to 6 months imprisonment, or both	up to 18 months	up to 18 months	up to 18 months	up to 18 months	up to 18 months
	Subsequent Offence	Fine up to \$2,000, or up to 1 year imprisonment, or both	Fine up to \$2,000, or up to 1 year imprisonment, or both					
IV	First Offence		Fine up to \$1,000, or up to 6 months imprisonment, or both	up to 1 year	up to 1 year	up to 1 year	up to 1 year	up to 1 year
	Subsequent Offence		Fine up to \$2,000, or up to 1 year imprisonment, or both					
V	First Offence					up to 1 year	up to 1 year	
	Subsequent Offence							
VI	First Offence					up to 18 months	up to 18 months	
	Subsequent Offence							

**Appendix II:**

Maximum penalties for a person found guilty of an offence prosecuted by *indictment* associated with each Schedule to the CDSA, as described in Part I of the Act

Schedule	OFFENCE						
	Simple Possession 4(1)	Double Doctoring 4(2)	Trafficking 5(1)	Possession for the purpose of trafficking 5(2)	Importing and exporting 6(1)	Possession for the purpose of exporting 6(2)	Production 7(1)
I	Imprisonment up to 7 years	Imprisonment up to 7 years	Life imprisonment	Life imprisonment	Life imprisonment	Life imprisonment	Life imprisonment
II	Imprisonment up to 5 years less a day  (Not applicable for Schedule VIII (marihuana, 30G, cannabis resin, 1G))	Imprisonment up to 5 years less a day	Life imprisonment  Schedule VII (marihuana/cannabis resin <3KG: imprisonment up to 5 years less a day)	Life imprisonment  Schedule VII (marihuana/cannabis resin <3KG: imprisonment up to 5 years less a day.	Life imprisonment	Life imprisonment	Life imprisonment  However, if cannabis (marihuana) imprisonment up to 7 years
III	up to 3 years	up to 3 years	up to 10 years	up to 10 years	up to 10 years	up to 10 years	up to 10 years
IV		up to 18 months	up to 3 years	up to 3 years	up to 3 years	up to 3 years	up to 3 years
V					up to 3 years	up to 3 years	
VI					up to 10 years	up to 10 years

**Salvia divinorum**

Jocelyn Kula to: [REDACTED]

2010-12-24 12:54 PM

Cc: Denis Arsenault, Stephanie Chandler

Hi [REDACTED]

It is a long while since we have spoken I know, so trust that this message finds you well.

I am writing about *Salvia divinorum* and its active ingredient Salvinorin A, which are not yet regulated as controlled substances in Canada.

We are currently finalizing a comprehensive scheduling assessment of the substances, and would appreciate clarification of some information we came across on the National Institute of Drug Abuse (NIDA) website. Essentially, the page we found (I regrettably don't have the link at hand but can provide if you need it), seems to suggest that the DEA is considering classifying *S. divinorum* as a Schedule I drug. We would appreciate confirmation of this information as it was always my understanding that while the import and/or distribution of Salvia is illegal in some individual states, the DEA only considers it to be a substance of concern at this point in time. In this regard, any additional information regarding the federal control of these substances (actual or planned if you can share) which you can provide would be greatly appreciated. As you can imagine, there is an intense amount of interest in products containing salvia further to the appearance of the Miley Cyrus video on Youtube.

Best wishes of the season, and I look forward to hearing from you.

Jocelyn

Just to be clear- this is the note for PCO that we are talking about here right?

Just that this AR talks about a briefing note when Cathy told me the product for PCO could be in an  
email...

Pls confirm and reply to all as I am not in the office today but Stephanie Chandler in RPD/ OCS will be  
starting on this today.

Thanks Jesse,

Karen and Linsey -- please let us know on process for this BN.

Cyndi - - this will need to be tasked to OCS for a quick turn around to DGO as the BN is due in MBU next Tuesday, Jan. 4/11.

---

Hi Stephanie -

I will advise MBU that #1 and 3 have already been provided as follow-up to the verbal briefing.

However, for the BN request, we cannot close this request. Rather, CSTD will still prepare one briefing note, on the same schedule as originally requested. We will request that MO approve this note for it to be sent to PCO. If we need to have it to PCO by the 7th, a deadline of the 4th to MBU will still be necessary.

Karen and Linsey will advise next week on the best process for getting the green light to send this BN to PCO.

Thanks,

Jesse

---

Hi Jesse,

Further to our conversation --- in response to this action request below:

1) Appended to our meeting summary sent this morning to Claudia re: the Salvia MO briefing on Tuesday, we provided the info. requested below (re. CDSA info. and CADUMS/Youth Smoking Survey data).

2) Cathy received a call today from PCO asking for a BN for the PMO on Salvia (due in PCO Jan. 7). Ruth is to call her next Wed. to discuss further re; what they are looking for precisely.

RECOMMENDATION - rather than provide a separate BN on this same issue per the request below, we suggest that the Note for PCO/PMO over-ride this request as MO will need to approve the note before it goes to PCO/PMO.

i.e. It would be duplicative to write two separate notes on the same issue in the same time frame, esp. given one is for PCO/PMO and MO will be involved.

Please let us know if the PCO/PMO note will suffice, and that this request below can be closed.

Thanks very much,  
S

Just spoke to Stephanie Szick about being unclear on the format. She told me to tell Stephanie Chandler to proceed with Briefing note to the Minister (following template):

BRIEFING NOTE - TO THE MINISTRE'S OFFICE.wpd

She said if she finds out differently, she will let us know.

We'll need something by tomorrow to meet Friday's 10:00 AM deadline.

Thanks!

Hi Jocelyn,

This is the note for PCO, and it will need to be a briefing note.

Thanks

Thanks Jesse,

Karen and Linsey -- please let us know on process for this BN.

Cyndi - - this will need to be tasked to OCS for a quick turn around to DGO as the BN is due in MBU next Tuesday, Jan. 4/11.

### 1) Timelines:

NOI can go as soon as it is approved; typically the Canada Gazette office needs 6 business days with the content before it is printed but they have special deadlines over the holidays, i.e. cut off for January 1, 2011 edition is today and cut off for January 8, 2011 edition is December 29, 2011; CG I is printed every Saturday.....

Comment period for an NOI is typically 30 days and then we would need time to review all responses received (if any) and factor into our RIAS/ regs package.

Most important next step is to get triage statement completed and over to TB for review; we have not engaged them on this file as of yet.

Remaining steps are then to build rest of regs package, i.e., RIAS (based on scheduling IAS), memo to the Min, supp note (if we deem one necessary), etc. Note that we also have never flagged salvia in our drafting priorities so there would also have to be some negotiating with the drafting service if the Department really wants to move on this.

Bottom line is that the earliest we could probably be in CG I is June 2011.

### 2) NHPs

You have probably seen the exchanges between MO and HPFB last night and their response re. compliance. At the end of the day, this is an issue we will have with any plant that has psychoactive properties and is not yet regulated as a controlled substance, i.e., a plant that has hallucinogenic properties will always meet the definition of an NHP according to the NHP regs, and thus it would be wrong of HC not to state clearly that it is illegal for unauthorized NHPs to be sold in Canada. The problem is, and HPFB knows this, is that all of the product coming into Canada and being sold in Canada is not coming in as an NHP or being sold as any kind of health product, nor is it being sold as having hallucinogenic properties. Instead, it comes in as a consumer product, probably labelled as incense or room aromatizer, and people buy it and use it for a totally different purpose. And, this is why, despite all the language in our lines around potential compliance and enforcement actions under the *Food and Drugs Act*, HPFB has never prioritized action on Salvia. Also why I think we should move to some slightly softer language around NHP classification in our recent media responses (talked to Stephanie about this

yesterday), as to me, the whole NHP classification issue is really a bit of smoke and mirrors. Even if we were not recommending scheduling under the CDSA as we are now, I don't think that HPFB would be leaping out of the gate with an aggressive compliance and enforcement plan.....

I will bring a copy of the IAS with me for when we meet, as well as a copy of the updated NOI, media lines and QP. See you at 12:30.

Jocelyn

## Triage Statement Form

V.1

### Section I: Overview

Security classification  
Protected B

#### Date received by RAS:

Title of the Regulatory Proposal: **Addition of *Salvia divinorum* and salvinorin A to Schedule III of the *Controlled Drugs and Substances Act (CDSA)***

Sponsoring Regulatory Organization(s): **Health Canada**

Statutory Authority: ***Controlled Drugs and Substances Act (CDSA)***

Approximate date of submission of regulatory proposal to RAS: **2011**

#### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor its main active ingredient salvinorin A are currently included in any of the Schedules to the *Controlled Drugs and Substances Act (CDSA)*.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs. Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its

unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA, such as LSD and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both <sup>of these substances</sup> as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

## Objectives

Including *S. divinorum* and its main active ingredient salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA) would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

Presently, products containing *S. divinorum* or salvinorin A that are marketed as hallucinogens are considered unauthorized natural health products and may be subject to compliance and enforcement actions under the *Food and Drugs Act* (FDA). However, most products containing these substances are not marketed in this way and therefore administrative regulations under the FDA cannot be applied or enforced. The control of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances. Control measures for substances listed in the CDSA are more stringent than for substances regulated under the FDA. The CDSA also sets out penalties for illegal activities involving substances listed in its Schedules.

<sup>*S. divinorum* & salvinorin A</sup>  
Scheduling ~~these substances~~ under the CDSA will reduce the risks associated with the increased use and unknown effects of ~~*S. divinorum* and salvinorin A~~ <sup>these substances</sup>. In this way, the control of *S. divinorum* and salvinorin A under the CDSA will protect the health and safety of Canadians, particularly youth.

## Description

Health Canada is proposing to include the following substances in Schedule III to the CDSA:

- *Salvia divinorum*; and
- Salvinorin A

**Page(s) 002162 to\à 002173**

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

Treasury Board of Canada  
Secrétariat

Secrétariat du Conseil du Trésor  
du Canada

*The regulatory organization should provide a rationale in writing if the regulatory organization wishes to obtain an exemption from RAS on some of the requirements listed above:*

*RAS should list any additional requirements for this proposal, such as policy cover, program funding, or other information:*

In the case of a MAR, RAS approves the use of the MARs process:

Yes  No

**Departmental signoff (Director):**

Name and title (print):

Date:

Name and address of departmental contact person(s):

**RAS signoff (analyst):**

Date:

The regulatory organization should send two signed copies of the final Triage Statement to RAS. RAS will then sign the two Triage Statements and return one copy to the regulatory organization.

## HECSB SIMS Stakeholder Types and Sub-types FINAL April 7, 2010

This classification scheme describes stakeholder types and sub-types for HECSB SIMS. Please include in the Excel template **both** a stakeholder type and sub-type(s), where available, selected from this table. An organization can be assigned only one single stakeholder type, however multiple sub-types can be selected if they exist, and are applicable.

Stakeholder Types	Stakeholder Sub-types	Description
Academia/ Education and Research		Organizations involved in providing academic expertise, teaching and/or research, in a broad range of disciplines (e.g. physical sciences, social sciences) or vocations. They generally don't sell their technology or results of scientific research for a profit. In the case where it is profit driven, it needs to be classified as an Industry organization. The purpose of Health Canada's involvement with these organizations is essentially due to their expertise in respective fields.
<p><i>- Contact TBS-RAS analyst</i></p> <p><i>- approves triage statement</i></p>		<p>organizations with a focus on providing education. Academia is a collective term <u>institutions</u> and <u>scholars</u> engaged in <u>higher</u> Education is the process by which society accumulated <u>knowledge</u>, <u>values</u>, and <u>skills</u> together through institutions.</p> <p>, public schools, vocational schools</p>
<p><i>N001</i></p> <p><i>NHPD → Lisa<sup>M.</sup> Young</i></p> <p><i>- applicants</i></p>		<p><b>ation/Licensing/Standards:</b> Accreditation is the process of confirmation of competency, authority, or certification refers to the confirmation of an object, person or organization. 		<p><b>s/Boards: includes any non-profit organization with a primary focus on academia, education</b></p>
		<p>Association of Teachers, Canadian Research and Development Association, Association of Canadian University</p>

## HECSB SIMS Stakeholder Types and Sub-types FINAL April 7, 2010

This classification scheme describes stakeholder types and sub-types for HECSB SIMS. Please include in the Excel template **both** a stakeholder type and sub-type(s), where available, selected from this table. An organization can be assigned only one single stakeholder type, however multiple sub-types can be selected if they exist, and are applicable.

Stakeholder Types	Stakeholder Sub-types	Description
<b>Academia/ Education and Research</b>		<p>Organizations involved in providing academic expertise, teaching and/or research, in a broad range of disciplines (e.g. physical sciences, social sciences) or vocations. They generally don't sell their technology or results of scientific research for a profit. In the case where it is profit driven, it needs to be classified as an Industry organization. The purpose of Health Canada's involvement with these organizations is essentially due to their expertise in respective fields.</p>
	<b>Academia/ Education</b>	<p>o <b>Academia/Education:</b> organizations with a focus on providing academic expertise and/or education. Academia is a collective term for the <u>community of students and scholars</u> engaged in <u>higher education and research</u>. Education is the process by which society deliberately transmits its accumulated <u>knowledge, values, and skills</u> from one generation to another through institutions. e.g. universities, colleges, public schools, vocational schools</p>
	<b>Accreditation/ Certification/ Licensing/ Standards</b>	<p>o <b>Accreditation/Certification/Licensing/Standards:</b> Accreditation is a process in which certification of competency, authority, or credibility is presented. Certification refers to the confirmation of certain characteristics of an object, person or organization. This confirmation is often provided by some form of external review, education or assessment. Organizations that issue credentials or certify third parties against official standards are themselves formally accredited by accreditation bodies. Licensing organizations have authority to grant permission or 'license' to another party as an element of an agreement between those parties. Standards organizations have a recognized authority to establish standards. e.g. International Laboratory Accreditation Cooperation, Standards Council of Canada</p>
	<b>Associations/Societies/ Boards</b>	<p>o <b>Associations/Societies/Boards:</b> includes any non-profit organization that has a primary focus on academia, education and/or research e.g. Canadian Society of Teachers, Canadian Research and Institutional Planning Association, Association of Canadian University Planning Programs</p>

	<b>Research</b>	o <b>Research:</b> organizations (e.g. centers of excellence, institutes, etc) with a focus on research (e.g. scientific, applied, quantitative, qualitative), which could be in a broad range of disciplines. e.g. National Research Centre for Environmental Toxicology
<b>Blood/Cell, Tissue and Organ</b>	<b>Blood Industry</b>	o <b>Blood Industry:</b> For-profit activities related to blood components. e.g. Cangene Corporation
	<b>Blood Organizations</b>	o <b>Blood Organizations.:</b> Operates on not-for-profit basis and the business is related to blood components. e.g. Canadian Blood Services
	<b>Cell/Tissue/Organ Industry</b>	o <b>Cell/Tissue/Organ Industry:</b> Business line is related to cells, tissues and organs. e.g. Bone Bank Allograft
	<b>Cell/Tissue/Organ Organization</b>	o <b>Cell/Tissue/Organ Organization:</b> Not for profit organizations with a mandate related to cells, tissues and organs. e.g. Canadian Association of Eye and Tissue Bank.
<b>Community and Consumer Groups</b>		These are often non-profit organizations. Sub-types are based on their mission and segment/group of the population/community they represent. Multiple sub-types can be selected.
	<b>Aboriginal</b>	o <b>Aboriginal:</b> e.g. Congress of Aboriginal Peoples, Manitoba
	<b>Children</b>	o <b>Children:</b> e.g. INFACT Canada (Infant Feeding Action Coalition), day care/child care
	<b>Civil Societies/Unions</b>	o <b>Civil Societies/Unions:</b> Often non-governmental organizations and community groups that would want to become involved with collective action on shared visions beyond exercising right of vote on governance. When an interest group is not captured within the other sub-groups then they may be captured as civil societies. e.g. The Council of Canadians, Canadian Health Coalition, Democracy Watch, Family Services Canada. Labor & Union groups.
	<b>Consumer Organizations</b>	o <b>Consumer Organizations:</b> Represent the interests of consumers. e.g. Consumers Association of Canada, Consumers Council of Canada
	<b>Disabilities</b>	o <b>Disabilities:</b> The groups representing disabilities should not be considered as part of the <i>Patient and Prevention</i> type. e.g. Canadian Association of the Deaf, Canadian National Institute for the Blind, Canadian Paraplegic Association, Heart and Stroke Foundation
	<b>Environment/Ecology</b>	o <b>Environment/Ecology:</b> e.g. Sierra Club, Green Peace
	<b>Linguistic Minorities</b>	o <b>Linguistic Minorities:</b> Represent the interest of either the English or French community where it is the minority language in a given area or of a province.

		e.g. Association des universités de la francophonie canadienne
	<p><b>Multi-faith</b></p> <p><b>Multicultural</b></p> <p><b>Seniors</b></p> <p><b>Women</b></p> <p><b>Youth</b></p>	<p>o <b>Multi-faith:</b> e.g. Anglican Church of Canada, Maritime Sikh Society</p> <p>o <b>Multicultural:</b> e.g. Canadian Council on Multicultural Health</p> <p>o <b>Seniors:</b> e.g. Active Living Coalition for Older Adults</p> <p>o <b>Women:</b> e.g. National Council of Women of Canada, Women and Health Protection</p> <p>o <b>Youth:</b> e.g. Big Brothers Big Sisters of Canada, Girl Guides of Canada</p>
<b>Enforcement/ Fire and Rescue</b>	<p><b>Associations/Societies/ Boards</b></p> <p><b>Fire and Rescue</b></p> <p><b>Police</b></p> <p><b>Other</b></p>	<p>Enforcement is a term used to describe either an organization that enforces the laws of one or more governing bodies, or an organization that actively and directly assists in the enforcement of laws. In doing so, the enforcement organization assists the governing bodies to provide governance for their subjects and maintains social control.</p> <p>Sub-type selections include Associations/Societies/Boards , Fire and Rescue, Police, and Other</p> <p><b>Associations/Societies/Boards:</b> include any organization that has a primary focus on enforcement and/or fire and rescue. e.g. Canadian Association of Chiefs of Police</p> <p><b>Fire and Rescue</b> includes organizations that provide operations or services that usually involve the saving of <u>life</u>, or prevention of <u>injury</u> fire service. Fire and rescue services can fall within provincial/territorial, or municipal government responsibilities. e.g Fire Marshals, Fire Commissioners; Municipal: Fire Chiefs, Fire Departments ; Emergency Medical Services</p> <p><b>Police</b> includes those agencies that provide police services, usually of the <u>executive</u> branch of government, empowered to <u>enforce the law</u> and to ensure public and social order through the legitimized use of force. This includes also, RCMP—Royal Canadian Mounted Police—Canada's national police service and an agency of the Ministry of Public Safety Canada. e.g. Ontario Provincial Police, Ottawa Police, Royal Canadian Mounted Policy</p> <p><b>Other:</b> organizations that have a focus on enforcement and/or fire and rescue, that do not fit the description for the above sub-types.</p>
<b>Government</b>		Sub-type selections include four levels of Governments i.e. Federal, Provincial, Municipal and Territorial.

	<p><b>Federal</b></p> <p><b>Municipal</b></p> <p><b>Provincial</b></p> <p><b>Territorial</b></p>	<p><b>Federal:</b> e.g. United States Food and Drug Administration, Environment Canada, Canada Border Services Agency, Public Safety Canada</p> <p><b>Municipal:</b> e.g. City of Ottawa</p> <p><b>Provincial:</b> e.g. Ontario Ministry of Health and Long-Term Care</p> <p><b>Territorial:</b> e.g. Northwest Territories Department of Health</p>
<p><b>Industry</b></p>	<p><b>Agriculture</b></p> <p><b>Associations/Societies/Boards</b></p> <p><b>Biologics and Genetic Therapies and Radiopharmaceuticals</b></p> <p><b>Chemicals/Gas/Reagents</b></p> <p><b>Consultants</b></p> <p><b>Cosmetics and Personal Care Products</b></p>	<p>Overall Industry represents a large range of entities (e.g. companies, manufacturers, banks, associations supporting a specific stream of trade) with the common goal of generating profit for goods or services it provides. The range of entities can be extensive therefore the list of sub-types are intended to include more common products/commodities and industry establishment types encountered for Health Canada. If the sub-types are not applicable then it is recommended to select "Other goods and services".</p> <p>To optimize industry characterization multiple sub-types can be selected, for example commodity and establishment types.</p> <p>o <b>Agriculture:</b> e.g. CropLife Canada</p> <p>o <b>Associations/Societies/Boards:</b> Organizations, for-profit or not-for profit, that have a focus on supporting industry. e.g. Non-Prescription Drug Manufacturers Association of Canada, Canadian Chemical Producers Association, Canadian Horticultural Council</p> <p>o <b>Biologics and Genetic Therapies and Radiopharmaceuticals:</b> e.g. Confab Laboratories</p> <p>o <b>Chemicals/Gas/Reagents:</b> e.g. Dow Chemicals Ltd.</p> <p>o <b>Consultants:</b> are firms of professionals who provide advice in a particular area of expertise.</p> <p>o <b>Cosmetics and Personal Care Products:</b> Cosmetics are substances used to enhance or protect the appearance or odor of the human body. Personal Care Products are consumer products used for beautification and in personal hygiene. e.g. Avon Canada</p>
	<p><b>Consumer Products</b></p> <p><b>Distributors</b></p>	<p>o <b>Consumer Products:</b> are generally any tangible personal property that is used for personal, family or household purposes. e.g. Proctor &amp; Gamble Co., Mattel Inc.</p> <p>o <b>Distributors:</b> An establishment that sells primarily to retailers, other merchants or industrial, institutional, and commercial users, mainly for</p>

		<p>resale or business use. Includes wholesalers, distribution centers for retail chains and district offices.</p>
	<b>Drugs</b>	<p>o <b>Drugs:</b> e.g. Bayer HealthCare</p>
	<b>Education/Communications/Marketing</b>	<p>o <b>Education/Communications/Marketing:</b> an establishment involved in marketing, public relations or communications activities. e.g. Small World Media Group, Eden Advertising</p>
	<b>Environment</b>	<p>o <b>Environment:</b> e.g. for-profit organizations providing restoration/remediation services for contaminated land, consulting services, involved in removal/transport/disposal of environmental contaminants</p>
	<b>Food/Alcohol/Beverages/Food Additives/Nutrition</b>	<p>o <b>Food/Alcohol/Beverages/Food Additives/Nutrition:</b> It can include alcoholic beverages and water. e.g. McCain Foods Ltd.</p>
	<b>Importer/Exporter/Brokers</b>	<p>o <b>Importer/Exporter/Brokers:</b> An establishment primarily engaged in the importation of products for sale in Canada or the exportation of products manufactured in Canada. It includes firms/consultants/agents licensed by Canada customs authorities, which work on behalf of traders, for example, representing the importer/exporter when dealing with customs authorities.</p>
	<b>Manufacturers</b>	<p>o <b>Manufacturers:</b> An establishment primarily engaged in the manufacturing of products for use or sale. It is most commonly applied to industrial production, in which raw materials are transformed into finished goods on a large scale. Such finished goods may be used for manufacturing other, more complex products, or sold to wholesalers, who in turn sell them to retailers, who then sell them to end users- the "consumers. Also includes firms that package or re-label products under their own branding/logo.</p>
	<b>Medical Devices</b>	<p>o <b>Medical Devices:</b> e.g. Bayer Healthcare, Cook Canada, MedTronic Canada, 3M Canada</p>
	<b>Natural Health Products</b>	<p>o <b>Natural Health Products:</b> e.g. Asian Herbs and Nutritionals</p>
	<b>Other Goods and Services</b>	<p>o <b>Other Goods and Services:</b> those organizations not represented by any of the above sub-types. e.g. courier services, insurance companies</p>

	<p><b>Retailers</b></p> <p><b>Research and Development</b></p> <p><b>Tobacco</b></p> <p><b>Veterinary Drugs</b></p>	<p><b>o Retailers:</b> An establishment selling products directly to consumers. Includes vendors.</p> <p><b>o Research and Development:</b> An establishment, operating in a for-profit context, primarily engaged in creative work, undertaken on a systematic basis, in order to develop new products and/or services.</p> <p><b>o Tobacco:</b> e.g. Imperial Tobacco Group</p> <p><b>o Veterinary Drugs:</b> e.g. Schering-Plough Animal Health, Novartis Animal Health</p>
<p><b>Livestock Producers</b></p>	<p><b>Aquaculture</b></p> <p><b>Bees</b></p> <p><b>Cattle</b></p> <p><b>Eggs</b></p> <p><b>Goats</b></p> <p><b>Horses</b></p> <p><b>Milk</b></p> <p><b>Poultry</b></p> <p><b>Sheep</b></p> <p><b>Swine</b></p> <p><b>Other</b></p>	<p>Livestock Producers are in fact a category of Industry but are identified separately.</p>
<p><b>Media</b></p>		<p>Includes organizations that are designed to reach large audiences using tools such as newspapers, radio, TV etc. e.g. Canadian Health and Lifestyle Magazine, L'Actualité Médicale</p>
<p><b>Patient and Prevention Groups</b></p>		<p>Organizations that have activities related to supporting patients suffering from particular diseases; such as advocacy for research and treatment to eliminate disease; education and health promotion in order to prevent disease onset or early detection.</p> <p>There are large numbers of organizations representing different diseases. Many of the disease focused organizations are likely to undertake activities for both patient and healthy populations. The patient groups should not be mixed up with disability groups-which are included under 'Community and Consumer Groups' type.</p> <p>e.g. National Society of Disease Prevention, Canadian Cancer Society, Canadian Lung Association</p>

<p><b>Professionals Health</b></p>	<p><b>Associations/Societies/Boards</b></p> <p><b>Accreditation/Certification/Licensing/Standards</b></p> <p><b>Clinic/Hospitals/Health Centers</b></p> <p><b>Licensed Practitioners</b></p> <p><b>Other</b></p>	<p>Includes organizations/associations formed around members for their expertise in their respective fields of human and/or animal health, in order to deliver the services. Organizations in this case are dependent on the expertise of those who deliver the services.</p> <p>o <b>Associations/Societies/Boards:</b> e.g. Canadian Anesthesiologists Society, Canadian Association of Naturopathic Doctors, Canadian Nursing Association</p> <p>o <b>Accreditation/Certification/Licensing/Standards:</b> Accreditation is a process in which certification of competency, authority, or credibility is presented. Certification refers to the confirmation of certain characteristics of an object, person or organization. This confirmation is often provided by some form of external review, education or assessment. Organizations that issue credentials or certify third parties against official standards are themselves formally accredited by accreditation bodies. Licensing organizations have authority to grant permission or 'license' to another party as an element of an agreement between those parties. Standards organizations have a recognized authority to establish standards. e.g. World Health Organization (WHO), Royal College of Physicians and Surgeons, College of Veterinarians of Ontario, Pharmacy Examining Board of Canada</p> <p>o <b>Clinics/Hospitals/Health Centers:</b> e.g. Ottawa Civic Hospital</p> <p>o <b>Licensed Practitioners :</b> organization having a specialized type of licensed health practitioner e.g. podiatrist, chiropractor</p> <p>o <b>Other:</b> organizations that do not fit descriptions of the above sub-types.</p>
<p><b>Professionals -Non Health</b></p>	<p><b>Associations/Societies/Boards</b></p> <p><b>Accreditation/Certification/Licensing/Standards</b></p>	<p>Represents organizations formed around members for their expertise in their respective fields, other than human, animal and/or environmental health, in order to deliver the services. Organizations in this case are built around those professionals or vice versa.</p> <p>o <b>Associations/Societies/Boards:</b> Organizations with a focus on the interests of non-health professions. e.g. Canadian Law and Society Association</p> <p>o <b>Accreditation/Certification/Licensing/Standards:</b> Accreditation is a process in which certification of competency, authority, or credibility is presented. Certification refers to the confirmation of certain characteristics of an object, person or organization. This confirmation is often provided by some form of external review, education or assessment. Organizations that issue credentials or certify third parties against official standards are themselves formally accredited by accreditation bodies. Licensing organizations have authority to grant</p>

		permission or 'license' to another party as an element of an agreement between those parties. Standards organizations have a recognized authority to establish standards. e.g. Canadian Engineering Accreditation Board, International Standards Organization, International Electrotechnical Committee
	<b>Ethicists</b>	o <b>Ethicists:</b> e.g. Canadian Bioethics Society
	<b>Other</b>	o <b>Other:</b> e.g. Intersol Consulting Associates, law firms, lawyers, legal aid

## BRIEFING NOTE TO THE MINISTER'S OFFICE

### Regulatory Status of *Salvia divinorum* in Canada

#### ISSUE:

To respond to a request from the Privy Council Office (PCO) for more information regarding the current regulatory status of *Salvia divinorum* in Canada further to recent media attention surrounding this plant.

#### BACKGROUND:

*Salvia divinorum* is a species of sage belonging to the mint family. Both the plant *Salvia divinorum* and its main active ingredient salvinorin A are known to have both physical and mental effects which include hallucinations, out-of-body experiences, uncontrollable laughter, short-term memory loss and loss of consciousness.

Media interest surrounding *Salvia divinorum* is recurrent. Questions regarding this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young Hollywood celebrity Miley Cyrus smoking *Salvia divinorum*. There have also been several reports from scientific and media sources, indicating that *Salvia divinorum* has the potential for abuse, and is used by adolescents and young adults for its hallucinogenic properties.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year.

#### CURRENT STATUS:

Neither *Salvia divinorum* nor its active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to

these Conventions. Several countries (including Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) as well as some American states have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

At present, the plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned", nor are activities with it considered to be illegal in Canada. Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the Natural Health Products Regulations. To date, however, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

## BRIEFING NOTE TO THE MINISTER'S OFFICE

### Regulatory Status of *Salvia divinorum* in Canada

#### ISSUE:

To provide information regarding the regulatory status of *Salvia divinorum* in Canada further to increased. The Privy Council Office has subsequently asked for an information note on *Salvia divinorum*.

#### BACKGROUND:

*Salvia divinorum* is a species of sage belonging to the mint family. While uncertainty remains surrounding the health risks of the plant *Salvia divinorum* and its main active ingredient salvinorin A, both physical and mental effects are reported to include hallucinations, out-of-body experiences, uncontrollable laughter, short-term memory loss and loss of consciousness.

Media interest surrounding *Salvia divinorum* is recurrent. Questions regarding this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young Hollywood celebrity Miley Cyrus smoking *Salvia divinorum*. There have also been several reports from scientific and media sources indicating that *Salvia divinorum* has the potential for abuse, and is being used by adolescents and young adults for its hallucinogenic properties.

#### CURRENT STATUS:

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. While 0.2% of respondents aged 15 years and older reported using *Salvia divinorum* in the past year, 0.7% reported using illicit hallucinogens in the past year. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. In comparison, 6.9% indicated that they had used other hallucinogens in the last twelve months. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. By way of comparison, 2.4% of students reported using lysergic acid diethylamide (LSD) in

- 2 -

their lifetime and 6.3% of students reported using other hallucinogens (not including LSD or phencyclidine (PCP)).

Neither *Salvia divinorum* nor its active ingredient salvinorin A are listed under the United Nations Drug Control Conventions. As a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. Several countries, e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden, as well as some individual American states, have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

At present, the plant *Salvia divinorum* is not currently regulated under the CDSA and therefore the plant is not considered to be "banned", nor are activities with it considered to be illegal in Canada. Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations*. To date most *Salvia divinorum* products consumed for recreational purposes appear however to be sold as "incense" and Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* or salvinorin A as an ingredient.

While the sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* (FDA), the penalties applicable to incidences of unauthorized sale under the FDA are very low and would likely not deter a retailer from continuing to market unauthorized products.

It is because of this and the surveillance data indicating that there is an interest in *Salvia divinorum* among youth that the Controlled Substances and Tobacco Directorate (CSTD) is now proposing to add both substances to Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. This action will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances and will thus protect the health and safety of Canadians, particularly youth. The Issue Analysis Summary included in Appendix A further outlines the CSTD scheduling assessment of *Salvia divinorum*.

**Re: Fw: Updated Media Lines and Draft Notice of Intent for Salvia**

Jocelyn Kula to: Nicole Prentice

2011-01-04 11:03 AM

Cc: Stephanie Chandler, Christine Roush, stephanie.szick

Hi Nicole,

We did a briefing for MO on Salvia the week before the holidays, and are now working on a briefing note for MO/ PCO. As a result, DGO attention on the media lines and QP has redirected a bit. The briefing note is now with MO, and I can't say when we will get back to the media lines and QP etc. Soon though, as the note refers to an NOI being published in January, and of course, that means moving ahead with the lines and having the QP ready.

Subject: Updated Media Lines and Draft Notice of Intent for Salvia

---

Hi Stephanie,

Per previous instruction from Cathy and for Cathy's review and approval, please find attached a copy of the revised media lines for Salvia as well as our proposed Notice of Intent. We have worked with Comms on the media lines, and they are comfortable with us submitting them for Cathy's approval ourselves as we know that Cathy wanted to see both the media lines and the draft NOI at the same time. For this reason, we are not submitting the IYH for approval at this point; our thinking is that we would hold off on issuing that until the NOI was in print. We have already revised the text to be consistent however.

## BRIEFING NOTE TO THE MINISTER'S OFFICE

### Regulatory Status of *Salvia divinorum* in Canada

#### ISSUE:

To provide information regarding the regulatory status of *Salvia divinorum* in Canada.

#### BACKGROUND:

*Salvia divinorum* is a species of sage belonging to the mint family. While uncertainty remains surrounding the health risks of the plant *Salvia divinorum* and its main active ingredient salvinorin A, physical and mental effects are reported to include hallucinations, out-of-body experiences, uncontrollable laughter, short-term memory loss, and loss of consciousness.

Media interest surrounding *Salvia divinorum* is recurrent. Questions regarding this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows a young Hollywood celebrity smoking *Salvia divinorum*. There have also been several reports from scientific and media sources indicating that *Salvia divinorum* has the potential for abuse, and is being used by adolescents and young adults for its hallucinogenic properties.

#### CURRENT STATUS:

Results from the 2009 *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that 1.6% of Canadians aged 15 years and older reported having used *Salvia divinorum* at least once in their lifetime, and that youth aged 15 to 24 were much more likely to have used it than adults aged 25 years and older. Among respondents aged 15 years and older, 0.2% reported having used *Salvia divinorum* in the past year, compared to 0.7% having reported using other illicit hallucinogens such as lysergic acid diethylamide (LSD) and phencyclidine (PCP). In addition, the results from the 2008-2009 *Youth Smoking Survey* also show that 5% of 15-year-olds have used *Salvia divinorum* in the past 12 months, compared to 6.9% who indicated that they had used other hallucinogens in the last 12 months. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS)

- 2 -

indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of those students reported using this substance in the past year. By way of comparison, only 2.4% of students reported using LSD in their lifetime while 6.3% of students reported using other hallucinogens (not including LSD or phencyclidine).

Neither *Salvia divinorum* nor its active ingredient salvinorin A are listed under the United Nations Drug Control Conventions. As a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions. Several countries, e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden, as well as some individual American States, have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

At present, the plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned," nor are activities with it considered to be illegal in Canada. Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations*. Health Canada has not authorized for sale any natural health products containing *Salvia divinorum* or salvinorin A as an ingredient. However, to date most *Salvia divinorum* products consumed for recreational purposes appear to be sold as "incense."

While the sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* (FDA), the penalties applicable to incidences of unauthorized sale under the FDA are very low and would likely not deter a retailer from continuing to market unauthorized products.

It is because of this and the surveillance data indicating that there is an interest in *Salvia divinorum* among youth that the Department is now proposing to add *Salvia divinorum* and salvinorin A to Schedule III to the CDSA. This action will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances and will thus protect the health and safety of Canadians, particularly youth. The Issue Analysis Summary included in Appendix A summarizes the scheduling assessment on *Salvia divinorum*.

Subject: Salvia divinorum

Hi [REDACTED]

It is a long while since we have spoken I know, so trust that this message finds you well.

I am writing about *Salvia divinorum* and its active ingredient Salvinorin A, which are not yet regulated as controlled substances in Canada.

We are currently finalizing a comprehensive scheduling assessment of the substances, and would appreciate clarification of some information we came across on the National Institute of Drug Abuse (NIDA) website. Essentially, the page we found (I regrettably don't have the link at hand but can provide if you need it), seems to suggest that the DEA is considering classifying *S. divinorum* as a Schedule I drug. We would appreciate confirmation of this information as it was always my understanding that while the import and/or distribution of Salvia is illegal in some individual states, the DEA only considers it to be a substance of concern at this point in time. In this regard, any additional information regarding the federal control of these substances (actual or planned if you can share) which you can provide would be greatly appreciated. As you can imagine, there is an intense amount of interest in products containing salvia further to the appearance of the Miley Cyrus video on Youtube.

Best wishes of the season, and I look forward to hearing from you.

**Re: Salvia - NOI posting in CG1** 

Christine Roush to: Jocelyn Kula

2011-01-13 08:16 PM

Cc: Denis Arseneault, Stephanie Chandler

Thanks for your note Jocelyn. I understand that the late Dec period was a busy time for all; however I would like to be part of the process going forward and look forward to receiving the products from Denis, with Cathy's request for changes. I'll brief up to Dave, et al on the process for posting an NOI and how comms will be supporting this move. We should also ensure that the messaging for this is consistent with the It's Your Health info, which I'm sure will need some tweaks.

Christine

**Subject:** Re: Salvia - NOI posting in CG1

Hi Christine

Typically for an NOI (note there are no rules for this...), we do media lines only, and we prepare an email to affected stakeholders advising them that the NOI has been posted. No comms plan or other comms docs.

For salvia, the package that went to Cathy for approval included:

- 1) draft NOI
- 2) media lines (which we prepared using the draft lines for the IYH as a base) and
- 3) revised QP (which is not required per se but Cathy wanted as there has been some interest from MO and PCO and so she wanted to be prepared for when the house reconvenes)

While I admit that we didn't get you to look at the products before they went to Cathy, she was champing at the bit for them after the briefing in MO before the holidays and so we rushed them, but then she didn't look at them right away because of all the furf with tobacco. She has now reviewed though and we just got comments back today and a request for revised docs for Monday.

As I am thinking that you should probably see the next versions before they go back to Cathy, I am asking Denis and Stephanie in RPD to liaise with you at some point so you can see where things are at. Note that Cathy has specifically directed that the key messages in the media lines mirror to some extent the main bullets in the QP.....

Re. timing, our latest 3 month report says publication in CGI for early February but of course this is all conditional on what if anything we hear back from MO re the note we had to do after the holidays/ from PCO who were also asked to do an information note for MO.

Please feel free to contact Denis if you have any further questions.

Subject: Re: Fw: Approval - Salvia ML & IYH

Hi Christine

Sorry for the delayed reply. Just discussed Salvia with Cathy yesterday and now that there appears to be general departmental consensus re scheduling under the CDSA at the working level, she has agreed that we should begin to prepare an NOI for publication in CG I. We will use Salvia as an example when we brief Paul on the new proposed scheduling policy (PPR is scheduled for Dec 8 I believe), and of course, as soon as we put this in the 3 month table, we will likely have to do more briefings up the line as there has been quite a bit of interest in this file over time.

Bottom line, we can't go public with a doc that refers to the regulatory decision to schedule until after the NOI appears so Cathy won't be approving the IYH docs until then. One assumes that both the IYH and media lines will need tweaking re the scheduling decision in any case.

Out of the office today and tomorrow but back on Monday if you want to discuss further.

Hope this helps  
Jocelyn

Subject Re: Fw: Approval - Salvia ML & IYH

Hi Cathy - I can certainly appreciate your comments below regarding the urgency of these products, given everything else on your plate at the moment; however, I would like you to know that HPFB is really pushing for the IYH article and MLs to be approved as soon as possible, since the department has previously not been able to say too much on the issue of Salvia. Now, we can say that Salvia is technically illegal because it hasn't been approved as a natural health product. Also, these products have been in the works for over a year now, and many, many, people have been involved in their development. It would therefore be discouraging to all if the products were yet again held up. I understand that OCS is still studying the issue to see whether Salvia should be added to the list of controlled substances, and our lines currently reflect this. I understand that Jocelyn and Suzanne are in agreement with the messaging in these products and that Jocelyn is now on board with the approach of posting the IYH article on HC's website. I don't know when the 2nd meeting is scheduled of the working group to finalize the decision on Salvia, but if it is months from now, I would suggest we move forward with these products now, as too much time has already been spent on getting them to this stage of readiness.

Thanks Courtney!

I do have another question for you related to the NOI. We would like to make sure CBSA is aware once we publish it. Would your unit have the email for a person(s) who we could contact once it is published? No rush, if you could get back to me by the end of the first week of January that would be great. Enjoy your holidays!

**DRAFT V.8**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The control of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Jocelyn Kula to: Christine Roush

2010-12-17 05:22 PM

Nicole Prentice, Chantal Routhier-Garner, Denis Arsenault, Stephanie Chandler,

Cc: Suzanne Desjardins

Building on Suzanne's input. Approved for OCS:

**1) Is salvia legal to take in Canada? Is salvia legal to sell in Canada? Has Health Canada Approved the sale of the drug? Is it classified as a banned substance?**

~~A1) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.~~

~~To date, Health Canada has not licensed for sale any drug or Natural Health Product which contains salvia as an ingredient.~~

~~It is a contravention of the *Food and Drugs Act* and the *Natural Health Products Regulations* to sell Natural Health Products in Canada unless they have been reviewed by Health Canada and authorized for sale. NHPs authorized for sale will have a Natural Product Number (NPN), a Homeopathic Medicine Number (DIN-HM) or an Exemption Number (EN) on the label. The sale of unauthorized natural health products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.~~

~~Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.~~

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any Natural Health Product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Complaints about the sale of unauthorized products containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate by calling 1-800-267-9675.

**2) Given the negative effects of side effects, why doesn't HC stop the sale of salvia? If it is illegal then why is it readily available? Why isn't there a greater push to enforce (a ban) the substance?**

A2) Health Canada is currently assessing whether the regulation of *Salvia divinorum* and/or salvinorin A under the *Controlled Drugs and Substances Act* is warranted.

**3) Since when has Health Canada been studying salvia?**

A3) Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* were have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. In addition, questions regarding the use of *Salvia divinorum* in the general population were have also been included in the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the data released in July 2010. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available. (URL: <http://www.hc-sc.gc.ca/hc-ps/drugs-drogues/stat/index-eng.php>)

**4) What are your reactions to the Saskatchewan radio DJ openly getting high off salvia on his radio show today?**

A4) Health Canada does not recommend the use of products containing *S. divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

**5) How many complaints has Health Canada received about the substance?**

A5) Health Canada has not received any complaints about this substance. [Could also include the line from past media responses re the four adverse reactions, as long as you also include the caveat about how one can't extrapolate from this because the number is so small....]

**6) Has anyone died from taking the substance?**

A6) We are not aware of a death having occurred in Canada as an immediate consequence of the use of the drug.

Subject: Re: Issues Mgmt Table - Salvia

---

Turns out - it has gone to MO. It just wasn't routed properly in MECS - it was sent by email on the 5th.

MO has not come back with any questions or concerns at it has been a week. As you know the briefing  
note was not "for approval", so we won't get a response from MO. I can try to do a signal check through  
DMO, but we may not have any luck getting a clear answer. I think our best bet would be to do a "PCO is  
sending their note to PMO this week - speak now, or it goes".

Does that work for you?

Yes we have media lines but at this point they are focused on imminent NOI. The IYH is ready to go but again, is pending publication of the NOI as thinking was that there was no point in going out with original text that suggested no scheduling action (because when IYH was first developed we had not concluded scheduling assessment) when shortly thereafter, we would be going out with the NOI stating that we are pursuing scheduling. The plan is still to do the IYH, but only once the NOI is out there and we are "on our way" to scheduling.

Let me know if you want to see the media lines.

Subject: Re: Salvia - NOI posting in CG1

Hi Christine

Typically for an NOI (note there are no rules for this...), we do media lines only, and we prepare an email to affected stakeholders advising them that the NOI has been posted. No comms plan or other comms

docs.

For salvia, the package that went to Cathy for approval included:

- 1) draft NOI
- 2) media lines (which we prepared using the draft lines for the IYH as a base) and
- 3) revised QP (which is not required per se but Cathy wanted as there has been some interest from MO and PCO and so she wanted to be prepared for when the house reconvenes)

While I admit that we didn't get you to look at the products before they went to Cathy, she was champing at the bit for them after the briefing in MO before the holidays and so we rushed them, but then she didn't look at them right away because of all the furf with tobacco. She has now reviewed though and we just got comments back today and a request for revised docs for Monday.

As I am thinking that you should probably see the next versions before they go back to Cathy, I am asking Denis and Stephanie in RPD to liaise with you at some point so you can see where things are at. Note that Cathy has specifically directed that the key messages in the media lines mirror to some extent the main bullets in the QP.....

Re. timing, our latest 3 month report says publication in CGI for early February but of course this is all conditional on what if anything we hear back from MO re the note we had to do after the holidays/ from PCO who were also asked to do an information note for MO.

Please feel free to contact Denis if you have any further questions.

Jocelyn

DRAFT 15  
January 14, 2010

### Media Lines *Salvia divinorum*

#### Issue

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

#### Key Messages:

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- In February 2011, Health Canada published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI is intended to give Canadians the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

#### Supplementary Messages:

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

- Deleted:** however,

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, increased use and unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The sale of such unauthorized products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Deleted: unauthorized

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: on

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year;  
and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Christine,

As I stated previously, the revised media lines have not been approved by OCS (Denis has also not reviewed), and therefore I doubt Jocelyn would share them with MO, but rather has a copy for her own information. Attached below is the version Jocelyn has, however I'm fairly certain it will be updated again before she approves them.

No need to worry Christine. Dave and I did not have time to consult Paul about whether he would raise Salvia or not and so I saw no benefit to sharing lines which I have not even read with Dave, when they most certainly were not going to be tabled at the meeting.

As it turns out, the discussion was very brief and really centered around Paul getting confirmation that we could proceed with the NOI.

Rest assured, no one, least of all I, is trying to usurp the comms approval process!

I will try and touch base with you re the lines (when I have read them) at the end of the day

DRAFT 15, 2011  
January 14, 2010

### Media Lines *Salvia divinorum*

#### Issue

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

#### Key Messages:

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A, under Schedule III to the CDSA in order to protect the health and safety of Canadians, particularly youth.
- Health Canada will publish a *Notice to Interested Parties* (NOI) in *Canada Gazette, Part I* in February 2011. The NOI will give people the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances. Once *Salvia divinorum* and salvinorin A are regulated as controlled substances, the following activities would be prohibited unless authorized by regulation: possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

#### Supplementary Messages:

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia*

*divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

#### Questions and Answers:

##### **Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

##### **Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, increased use and unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario

students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The sale of such unauthorized products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Deleted: unauthorized

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article for the departmental website about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: on

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, increased use and unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The sale of such unauthorized products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Deleted: unauthorized

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article for the departmental website about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: on

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Media Lines  
Salvia divinorum  
(Post Issuance of NOI)

OK by me  
pls fix and send to Christine  
pls ask her to let us know if she has issues that can be

considered approved for OCS  
but need to go back to cat with NO package  
Does she want

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

In Feb 2011, Health Canada will publish a Notice to Interested Parties (NOI) in Canada Gazette, Part I in February 2011. The NOI will give people the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.

The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will prohibit, unless authorized by regulation, possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.

The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

*match*  
The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q2 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A2 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, increased use and unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q3 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A3 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities may be prohibited unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will then be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) when marketed as a hallucinogen. The sale of such unauthorized products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

Deleted: unauthorized

**Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A4 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

In the interim, *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum****

A - Health Canada is developing an It's Your Health article ~~for the departmental website about *Salvia divinorum*~~ to help inform the general public about the risks associated with the use of this plant.

Deleted: on

Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations*.

## QUESTION PERIOD NOTE

### NOTE POUR LA PÉRIODE DE QUESTIONS

#### SUBJECT - SUJET

English:

**DRUGS - SALVIA DIVINORUM**

Français:

**DROGUES - SALVIA DIVINORUM**

---

#### SYNOPSIS - SOMMAIRE

English:

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young Hollywood celebrity Miley Cyrus smoking Salvia divinorum. There have also been several reports from scientific and media sources, indicating that Salvia divinorum has the potential for abuse, and is used by adolescents and young adults for its hallucinogenic properties.

---

#### ANTICIPATED QUESTION - QUESTION PRÉVUE

English:

What is Health Canada doing to protect Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

---

English:

- Health Canada is proposing to regulate both *Salvia* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- In February 2011, Health Canada published a *Notice to Interested Parties* in *Canada Gazette*, Part I. The NOI is intended to give Canadians the opportunity to provide comments on the proposal to regulate these two substances.
- The inclusion of *Salvia* in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (cultivation) illegal unless authorized by regulation.

Français:

---

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter

- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any Natural Health Product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

**DRAFT V.8**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The control of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

DRAFT V.9

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

## ÉBAUCHE V.9

MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDAS). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences hors du corps, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont incluses dans les annexes de la LRCDAS.

extra-corporel

actuellement (?) *yes*

Des rapports ont récemment été publiés, indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option/aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, et que les jeunes âgés de 15 à 24 ans étaient beaucoup plus nombreux à en avoir consommé que les adultes âgés de 25 ans ou plus. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au Canada montrent également que 5 % des jeunes de 15 ans ont consommé de la *S. divinorum* au cours de la dernière année. De plus, le *Sondage sur la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que

alternative

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no<sup>o</sup>10, pp. 1634-1639.

5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Étant donné ses effets inconnus, ainsi que sa similarité pharmacologique avec d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'ONU sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance contrôlée. L'Australie, la Belgique, le designé Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illégales présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux <sup>parties</sup> parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Hi Christine,

Just wondering what sort of timelines you have regarding reviewing the Salvia media lines. The DGO is still looking to see the entire Salvia package (MLs, NOI and QP Note) today. Would it be possible to have the media lines today given the lack of timing info for the news release at this point?

Thanks,

Stephanie

Hi Christine,

The notion of a News Release came out of left field, as I have to be honest and say that I don't think we have ever done an NR to go with an NOI. NOIs are usually pretty low key affair. In this regard, am not sure what further guidance we can provide at this point other than perhaps you can start drafting

something in line with the key messages in the media lines. Not sure about the reference to timing as it didn't really come up in MO this morning.....Paul just confirmed there were no issues with us proceeding to do the NOI and that Cathy will be signing off/ MO did not need to see the text etc. I think we actually say January for the NOI in our last 3 month report, so maybe we should look at what publication cut off dates match with that timeframe, ie., late Jan/ early Feb and work backwards from there?

Subject: Revised Salvia Media Lines

Hi Christine,

Please find attached the revised Salvia media lines which have been approved by OCS. CSTD DGO has requested that the media lines, along with the revised NOI and QP Note be sent back to the DGO on Monday. Please advise as to how you would like to handle this step in the approval process so that all the Salvia products can reach Cathy together.

**DRAFT V.8**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

DRAFT 15  
January 18, 2011

**Media Lines**  
*Salvia divinorum*

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- As a first step, Health Canada has published a *Notice to Interested Parties* (NOI) in *Canada Gazette, Part I* on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

## Questions and Answers:

### Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

### Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

### Q3 – Is there any research on the use of *Salvia divinorum* in Canada?

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario

¶  
A - Health Canada is developing an *It's Your Health* article

Deleted: on

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Deleted: about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.¶

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

The inclusion of <i>Salvia divinorum</i> and salvinorin A in Schedule III to the CDSA will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities would be prohibited unless authorized by regulation: possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

**DROGUES - SALVIA DIVINORUM**

---

**SYNOPSIS - SOMMAIRE**

English:

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young celebrity Miley Cyrus smoking Salvia divinorum. Canadian surveillance data indicates that this substance is being used by adolescents and young adults for its hallucinogenic properties, and there have also been several reports from scientific sources indicating that Salvia divinorum has the potential for abuse.

English:

- Health Canada is proposing to regulate Salvia under the *Controlled Drugs and Substances Act* in order to protect the health and safety of Canadians, particularly youth.
- Health Canada has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate Salvia.
- The regulation of Salvia will make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.

Français:

---

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

#### International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The regulation of *Salvia divinorum* will allow law enforcement to take action against illegal activities involving this substance. The possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation.

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Thanks for the copy of the NOI. I am just reviewing the MLs now - and these can go forward to Cathy for her approval after I finish my review, but the NR will have to wait until after I have revised the medical marihuana comms products, since the NR won't be posted until Friday Jan 28th. I will try and get the NR to you by Thursday, but I need to know if any of your partners, RCMP, etc, will be quoted in the release. I assume you have given your partners a head's up on this? At the same time, Dave Stephens, my Comms Exec., is giving MO a head's up of the posting/NR dates to see if they have any problems with the timing. We will let you know if they do.

Hi Christine,

With regards to our earlier conversation, I have spoken to Jocelyn who will get in touch with DGO with regards to timelines/priorities. In the mean time, as discussed, we are intending to submit the Salvia NOI on Fri Jan 21st for publication in CGI on Sat. Jan 29th. I have attached the current draft of the NOI below for your information when drafting the NR. I believe this document contains all of the info you will need, however if you do need any additional information, please let me know.

This message has been replied to and forwarded.

Hi Stephanie,

I have reviewed the MLs and made some changes in blue. Could you please provide a better answer to the question below -as it currently doesn't answer the question, which is about the process involved in listing - (i.e., we have finished our assessment, and are posting to CG1 for comment - but what comes after this, and how much time is involved and when are we likely to have it listed. Also, could you please update the approval totem at the end of the document listing who needs to approve these lines from HECS and HPFB. Please return them to me by 10:00 am tomorrow for one final review. Thanks.

Salvia Media Lines\_Jan 18 2011 (1).doc

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

DRAFT 15  
January 18, 2011

### Media Lines *Salvia divinorum*

#### Issue

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

#### Key Messages:

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.
- As a first step, Health Canada has published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

#### Supplementary Messages:

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Questions and Answers:

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

**Deleted:** Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?¶

A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.¶

If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum*¶

¶ A - Health Canada is developing an It's Your Health article

Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?

Deleted: on

A6 - Health Canada is developing an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.¶

**Background**

unauthorized

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

The inclusion of <i>Salvia divinorum</i> and salvinorin A in Schedule III to the CDSA will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities would be prohibited unless authorized by regulation: possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).

**Publication of Salvia NOI on Jan 29 - Items for review**  
Stephanie Chandler to: Stephanie Chandler

2011-01-18 04:34 PM

Hi Denis,

Jocelyn has received confirmation from DGO that we are to publish the Salvia NOI in CG1 on Jan 29th. Therefore, we need to submit our package to Canada Gazette on Friday, Jan 21. Jocelyn would like you to revise the three month report to indicate this accordingly.

There are a number of documents which I need you to review:

**For approval before Jan 21:**

Letter to Canada Gazette requesting insertion:

Salvia NOI Transmittal Letter.wpd

Request for Insertion form:

-Currently missing some administrative info, but I will provide to you once I have completed it.

I am awaiting approval of the NOI so that it can be sent for translation. Lisa Marie will also make a diskette with both versions on it.

**For approval before Jan 29:**

The list of stakeholders which I propose we send the NOI notification to:

List of Salvia Stakeholders v.1.doc

English notification to stakeholders:

Stakeholder notification of NOI Dec 23 2010 EN.wpd

This notification also needs to be translated to French. HPFB will also need to approve as NHPD will be sending the notification to their stakeholders as well. My original thinking was that we would use this document to notify our stakeholders once the NOI was published, however a recent email from Christine suggests that we should be giving some groups (such as the RCMP?) a heads-up prior to publication. If you agree, we should discuss who should be contacted.

Also, we have not yet discussed any web postings (on the Health Canada site). Is one necessary? Would this consist of the news release? Is there anything I should be preparing?

(You also have not yet approved the Jan 6th version of the Salvia IAS, but I don't believe that is a priority at this point.)

I am at the conference tomorrow in the AM, but happy to discuss in the afternoon.

Thanks,

Stephanie

**DRAFT V.9**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Subject: Re: Salvia Media Lines

Hi Christine,

We will work on that question, however, I'm not sure if we will be able to have it back to you by 10:00am tomorrow.

In regards to the approvals, how would you advise we proceed? We are not sure if HPFB needs to review. There seems to be only one line which refers to the NHP issue, so perhaps just Robin Marles in NHPD needs to see it? There also may be some changes as to who in PACCB needs to approve (e.g. Dave Stephens is not currently included in the list).

Thanks for your help with this.

Stephanie

Hi Stephanie,

I have reviewed the MLs and made some changes in blue. Could you please provide a better answer to the question below -as it currently doesn't answer the question, which is about the process involved in listing - (i.e., we have finished our assessment, and are posting to CG1 for comment - but what comes after this, and how much time is involved and when are we likely to have it listed. Also, could you please update the approval totem at the end of the document listing who needs to approve these lines from HECS and HPFB. Please return them to me by 10:00 am tomorrow for one final review. Thanks.

[attachment "Salvia Media Lines\_Jan 18 2011 (1).doc" deleted by Stephanie Chandler/HC-SC/GC/CA]

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

DRAFT 154

December 22/January 14, 2011

Canadian Media Lines  
Salvia divinorum  
surveillance data

#### Issue

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada and as well as reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

#### Key Messages:

- Health Canada has concluded its assessment of *Salvia divinorum* and its main active ingredient salvinorin A and is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A substances under Schedule III to the *CDSA in order to protect the health and safety of Canadians, particularly youth* *Controlled Drugs and Substances Act* (CDSA). Formatted: Font: Italic
- As a first step, in February 2011, Health Canada has published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances. The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances. Further to the regulation of these substances under the CDSA, the following activities would be prohibited unless authorized by regulation: possession, trafficking, possession for the purposes of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation).
- Health Canada will inform stakeholders of its proposal by publishing a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. The NOI will provide stakeholders and other interested parties with the opportunity to provide comments on the proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances. The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

#### Supplementary Messages:

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and/or body, and their impact on physical and mental functions.

- The plant *Salvia divinorum* is not regulated under the CDSA and therefore the plant is not considered to be "banned", nor are activities with it considered to be illegal in Canada. H
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations*. To date, however, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

### Questions and Answers:

**Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A1 – Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q21 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What is involved in does regulating *Salvia divinorum* as a controlled substance that involve and what stage is it at?**

A21 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a Notice to Interested Parties (NOI) in Canada Gazette, Part I. The publication of the *Salvia divinorum* NOI on January 29, 2011 is followed by a 30-day comment period. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

–The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

Formatted: Font: Italic

A3 - Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q34 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q34 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A34 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities ~~may~~ be ~~prohibited~~ unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will ~~then~~ be able to take action against suspected illegal activities involving these substances.

~~In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*~~

Handwritten notes: "illegal", "also however", "Salvia D..."

Handwritten note: "sll"

natural health

Needs line about none approved to date

when marketed as a hallucinogen. The ~~unauthorized sale of such~~ <sup>natural health</sup> ~~unauthorized~~ products containing *Salvia divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q45 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A45 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however,

~~In the interim,~~ *S. divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

Formatted: Font: Not Italic

A6 - Health Canada is developing an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Formatted: Font: Italic

Formatted: English (Canada)

~~If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum*~~

~~A – Health Canada is developing an *It's Your Health* article on about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.~~

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

#### International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The regulation of *Salvia divinorum* will allow law enforcement to take action against illegal activities involving this substance. The possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation.

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

DRAFT V.9

DEPARTMENT OF HEALTH

## CONTROLLED DRUGS AND SUBSTANCES ACT

### *Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to

---

concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Date \_\_\_\_\_

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'ONU sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDas). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDas.

Des rapports ont récemment été publiés, indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, et que les jeunes âgés de 15 à 24 ans étaient beaucoup plus nombreux à en avoir consommé que les adultes âgés de 25 ans ou plus. Les résultats de l'*Enquête sur le*

---

*la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Étant donné ses effets inconnus, ainsi que sa similarité pharmacologique avec d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no°10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'ONU sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

DRAFT 15  
January 18, 2011

**Media Lines**  
*Salvia divinorum*

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.
- As a first step, Health Canada published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on its proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Questions and Answers:

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

**A1 -** Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act (CDSA)* is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

**A2 -** Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

**Deleted:** Q1 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?¶

¶ A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.¶

¶ The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. A6 - Health Canada is developing an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. ¶

Deleted: ¶

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and.
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## **Media Lines** ***Salvia divinorum***

### **Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### **Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.
- As a first step, Health Canada published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on its proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

### **Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

**DRAFT**  
19/01/2011

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

### Questions and Answers:

#### **Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

#### **Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark,

**DRAFT**  
19/01/2011

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The *2009 Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A4 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities will be illegal unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will also be able to take action against suspected illegal activities involving these substances.

As a plant with hallucinogenic properties, however, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement

**DRAFT**

19/01/2011

action by Health Canada. Complaints about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;

**DRAFT**  
19/01/2011

- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Jocelyn

We've been told that the Minister's office wants to do an event for the posting of the NOI for Salvia. We told MO the posting was going to happen on Friday, January 28th. I sent you yesterday the revised MLs, and am waiting on Stephanie C to get back with a complete answer to Q1. We have started drafting the News Release, and I can send you the first draft tomorrow am. I imagine there will be an MBU request for a teleconf at some point to discuss venue, partners, etc.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. As of [REDACTED] 2011, Health Canada has not authorized for sale any products containing *S. divinorum*.

Deleted:

Deleted: 0

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

Deleted: 1

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

As a result of these concerns

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction.)

### Minimizing Your Risk

(Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.) Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "Need More Info?" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). However, after reviewing the available information regarding these substances, Health Canada is proposing to add *S. divinorum* and its main active ingredient, salvinorin A, to Schedule III to the CDSA.

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of [redacted] 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc. have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various

degrees, while others have placed restrictions on distribution. For example, In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The *2009 Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

### Health Canada's Role

Health Canada will continue to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. Health Canada will also continue to move forward with its proposal to include *S. divinorum* and salvinorin A under Schedule III of the CDSA according to the Canadian regulatory process. The first step of this process was the issuance of the *Notice to Interested Parties (NOI)* to schedule these substances under the CDSA. In the interim, Health Canada will continue to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

### Need More Info?

- Complaints about the <sup>unauthorized</sup> illegal sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.
- You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

**Deleted:** Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year.

It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following: ¶ a Natural Product Number (NPN); or ¶ an Exemption Number (EN); or ¶ a Drug Identification Number - Homeopathic Medicine Number (DIN-HM). ¶

**Deleted:** As of [redacted] 2010 no products containing *S. divinorum* or *salvinorin A* have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department. ¶

¶ Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act (CDSA)*. Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted. ¶

**Deleted:** Italy

**Deleted:** ,

**Deleted:** , etc...

*currently*

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. ~~For example,~~ <sup>for example,</sup> in some states, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

### Health Canada's Role

<sup>potential</sup>  
In light of the health and safety risks associated with the use of *S. divinorum*, Health Canada proposes to include *S. divinorum* and salvinorin A under Schedule III of the CDSA. As a first step in the process of regulating these substances, Health Canada issued a *Notice to Interested Parties (NOI)* outlining its proposal to schedule these substances under the CDSA. In the interim, Health Canada will continue to monitor the sale of unauthorized health products, including those that contain *S. divinorum* or its main active ingredient salvinorin A, and will take appropriate action when the department becomes aware of any unauthorized health products that may pose a risk to Canadians.

### Need More Info?

- Complaints about the unauthorized sale of drugs containing *S. divinorum* can be made to the **Health Products and Food Branch Inspectorate** at: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Tel: 1-800-267-9675.

**Deleted:** Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15yr olds have used *S. divinorum* in the past year.

**Deleted:** Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home.

**Formatted:** Font: Italic

Hi all,

Since the Minister's office now wants to have an event on Jan 28 for the publication of the NOI for Salvia, Cathy has asked that we push along the IYH. It will need to be posted to the website with the news release on Jan 28, probably early morning depending on the time of the event. This leaves us a week to update, share with HPFB, get all approvals and get translated , so we will need your input asap.

This is the latest version I have on hand of the IYH. Can you and your team please take a look at the content and provide input asap (Jan 20 COB or by noon Jan 21 at the latest).

Thanks in advance and sorry for the short time line.

Nicole

**DRUGS - SALVIA DIVINORUM**

Français:

**DROGUES - SALVIA DIVINORUM**

**SYNOPSIS - SOMMAIRE**

English:

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young celebrity Miley Cyrus smoking Salvia divinorum. Canadian surveillance data indicates that this substance is being used by adolescents and young adults for its hallucinogenic properties, and there have also been several reports from scientific sources indicating that Salvia divinorum has the potential for abuse.

**ANTICIPATED QUESTION - QUESTION PRÉVUE**

English:

What is Health Canada doing to protect young Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les jeunes Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

---

English:

- Health Canada is proposing to regulate Salvia under the ~~Controlled Drugs and Substances Act~~ in order to protect the health and safety of Canadians, particularly youth.
- Health Canada has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate Salvia.
- The regulation of Salvia will make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.

Français:

---

## BACKGROUND - CONTEXTE

English:

### BACKGROUND / CONTEXTE

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

#### International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The regulation of *Salvia divinorum* will allow law enforcement to take action against illegal activities involving this substance. The possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation.

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

The  
Stephanie

Dear Sir/Madam:

The purpose of this email is to advise you that a *Notice of Intent* regarding the following substances was published in the *Canada Gazette*, Part I (CGI) on January 29, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:  
<http://canadagazette.gc.ca/> pages xx-xx in PDF format (pages xxxx-xxxx in *Canada Gazette*, Part I).

This NOI <sup>indicates</sup> Health Canada's <sup>proposal</sup> intent to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining ~~appropriate scheduling under the CDSA~~ <sup>regulatory controls.</sup>

If you are interested in this process or wish to provide us with information for our consideration please do so by February 28, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

PLEASE FORWARD THIS EMAIL TO OTHERS WHO MAY BE INTERESTED.

Should this notification have reached you in error, it would be appreciated if you could please forward it to the appropriate person in your organization and ask that person to inform us of this by sending an e-mail to: [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Thank you,

Regulatory Policy Division

Dear Ms. Boisvert:

Re: **Notice to Interested Parties - Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).**

Please find enclosed, in both official languages, the following documents:

- two hard copies of a Notice to Interested Parties regarding these substances;
- electronic copies of the notice, English and French versions in two separate files; and
- a signed and completed "Request for Insertion" form.

We ask that the notice be published in *Canada Gazette*, Part I, on January 29, 2011. The departmental contact for this notice is Stephanie Chandler, who can be reached at 613-946-0124.

Yours sincerely,

Jocelyn Kula  
A/Director  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate

Subject: Note for PCO re salvia

---

hi Jocelyn,

Following up on the trail below --- Paul approved the Salvia note with v. minor edits, and this morning DMO gave nod for us to share that version of the note with Ruth in PCO. For quick grab, I've attached here the Paul approved version of the note from MECS.

Further to Ruth's emails last week and your conversation with her, please send this briefing note to Ruth, with a cc to Cathy.

Thanks very much!

The revised document would be in MECS. DMO is looking at it right now - it would be preferable to wait until they have had a chance to review before we send to PCO just in case there are any show-stoppers. Will advise later this afternoon.

hi Jesse

Hope you had a relaxing holiday!

Back at it today.

What were the changes...can you send that version?

Also, Cathy wondering if we could send to Ruth now....with caveat it's in approvals. We provided her with the IAS last week. I will send you an email now re: summary of Jocelyn's conversation with Ruth...

From: Jesse Arnup-Blondin/HC-SC/GC/CA

Subject: Note for PCO re salvia

Paul signed off on the note today with a few minor edits. Once it arrives in MO (that is, once it has been DM approved), CSTD can send that version to PCO.

Let me know if there are any questions - I know there was a bit of confusion last week about the best process for this.

Jesse

## BRIEFING NOTE TO THE MINISTER'S OFFICE

### Regulatory Status of *Salvia divinorum* in Canada

#### ISSUE:

To provide information regarding the regulatory status of *Salvia divinorum* in Canada.

#### BACKGROUND:

*Salvia divinorum* is a species of sage belonging to the mint family. While uncertainty remains surrounding the health risks of the plant *Salvia divinorum* and its main active ingredient salvinorin A, physical and mental effects are reported to include hallucinations, out-of-body experiences, uncontrollable laughter, short-term memory loss, and loss of consciousness.

Media interest surrounding *Salvia divinorum* is recurrent. Questions regarding this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows a young Hollywood celebrity smoking *Salvia divinorum*. There have also been several reports from scientific and media sources indicating that *Salvia divinorum* has the potential for abuse, and is being used by adolescents and young adults for its hallucinogenic properties.

#### CURRENT STATUS:

Results from the 2009 *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that 1.6% of Canadians aged 15 years and older reported having used *Salvia divinorum* at least once in their lifetime, and that youth aged 15 to 24 were much more likely to have used it than adults aged 25 years and older. Among respondents aged 15 years and older, 0.2% reported having used *Salvia divinorum* in the past year, compared to 0.7% having reported using other illicit hallucinogens such as lysergic acid diethylamide (LSD) and phencyclidine (PCP). In addition, the results from the 2008-2009 *Youth Smoking Survey* also show that 5% of 15-year-olds have used *Salvia divinorum* in the past 12 months, compared to 6.9% who indicated that they had used other hallucinogens in the last 12 months. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS)

- 2 -

indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of those students reported using this substance in the past year. By way of comparison, only 2.4% of students reported using LSD in their lifetime while 6.3% of students reported using other hallucinogens (not including LSD or phencyclidine).

Neither *Salvia divinorum* nor its active ingredient salvinorin A are listed under the United Nations Drug Control Conventions. As a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions. Several countries, e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden, as well as some individual American States, have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

At present, the plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be “banned,” nor are activities with it considered to be illegal in Canada. Nevertheless, when specifically marketed for its hallucinogenic properties, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations*. Health Canada has not authorized for sale any natural health products containing *Salvia divinorum* or salvinorin A as an ingredient. However, to date most *Salvia divinorum* products consumed for recreational purposes appear to be sold as “incense.”

While the sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* (FDA), the penalties applicable to incidences of unauthorized sale under the FDA are very low and would likely not deter a retailer from continuing to market unauthorized products.

It is because of this and the surveillance data indicating that there is an interest in *Salvia divinorum* among youth that the Department is now proposing to add *Salvia divinorum* and salvinorin A to Schedule III to the CDSA. This action will reduce the potential health and safety risks associated with the ready availability, increased use and unknown effects of these substances and will thus protect the health and safety of Canadians, particularly youth. The Issue Analysis Summary included in Appendix A summarizes the scheduling assessment on *Salvia divinorum*.

**CONCLUSION:**

# News Release

## The Government of Canada Proposes to Regulate *Salvia Divinorum* and Salvinorin A as Controlled Substances

January 28, 2011  
For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health released a Notice to Interested Parties, also known as a Notice of Intent, in the *Canada Gazette*, Part I, on the proposal to regulate *Salvia divinorum* and salvinorin A, known as *Salvia*, as controlled substances.

This notice will provide interested stakeholders with the opportunity to comment on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

"After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is a serious concern for all Canadians because not enough is known about the long-term effects of *Salvia divinorum*," added Aglukkaq.

Including these substances within the *Controlled Drugs and Substances Act* will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation. Also, the regulation of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

The Notice to Interested Parties will be published in *Canada Gazette*, Part I, on January 29, 2011. Interested parties are encouraged to submit comments before February 27, 2011.

For more information on *Salvia divinorum*, please visit: *It's Your Health - Salvia divinorum*: [XXXX](#)

**Comment [h1]:** Standard text from previous enquiries.

**Comment [h2]:** For confirmation from program that this is the end of public comment.

**Comment [h3]:** Weblink – OCS - Please advise whether this will be posted next week.

Canada

DRAFT 15  
January 18, 2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.
- As a first step, Health Canada published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on its proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because very little is known about these substances and their potential effects on the brain and body.
- The plant *Salvia divinorum* is not regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Questions and Answers:

**Q1 - What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

**Q2 - Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 - Is there any research on the use of *Salvia divinorum* in Canada?**

Deleted: Q1 - Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?¶

¶ A1 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.¶

If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum*¶

¶ A - Health Canada is developing an It's Your Health article

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

Deleted: on

A6 - Health Canada is developing an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.

Deleted: about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant.¶

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**DRAFT V.9**

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup>Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

# News Release

## The Government of Canada Proposes to Regulate *Salvia Divinorum* and Salvinorin A as Controlled Substances

January 28, 2011  
For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health released a Notice to Interested Parties, also known as a Notice of Intent, in the *Canada Gazette*, Part I, on the proposal to regulate Salvia divinorum and salvinorin A, known as Salvia, as controlled substances.

This notice will provide interested stakeholders with the opportunity to comment on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

"After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is a serious concern for all Canadians because not enough is known about the long-term effects of Salvia divinorum," added Aglukkaq. *font*

Including these substances within the *Controlled Drugs and Substances Act* will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation. Also, the regulation of *S. divinorum* and salvinorin A under the CDSA will enable law enforcement agencies to take action against suspected illegal activities involving these substances.

The Notice to Interested Parties will be published in *Canada Gazette*, Part I, on January 29, 2011. Interested parties are encouraged to submit comments before February 27, 2011. *28*

Lisa/Elizabeth,

Could you please **hold off** on circulating versions of the It's Your Health article for review and approvals **until further notice**. My client is reassessing the need to publish the article at this time - and if the decision is taken to publish it, then the Office of Controlled Substances will need to revise the article to ensure it is in line with the Notice of Intent.

Thank you all for your continued patience with this issue.

Hello all,

I need full approvals of the IYH article by end of day Friday at the latest. All the same people need to approve the IYH at HECSB and HPFB and I also need time for translation, revision and formatting. I will need all approvals (HECSB and HPFB) completed by Wednesday morning at the very latest in order to complete this and even at that this will be a huge push to get it done. It's too bad that it wasn't ready to go earlier in case something like this came up.

Here is the latest version I have, I assume there have been additional changes made...

---

Since there is a long list of people who need to see and approve the Salvia MLs from HPFB, could you please start the review and approval process. Jocelyn Kula, A/Director of the Office of Controlled Substances has signed off on these lines. I am continuing to move them through CSTD approvals. Ideally, we would need full approvals of the lines by **Monday, Jan 24**, the latest.

Thanks,

Hi Suzanne,

I read this story in the NY times this morning on the bus regarding salvia. Not sure if it is of interest to your group, but considering the high profile of the Arizona shooting it may raise more awareness around salvia.

Thanks,  
Mark

## Shooting Suspect Had Been Known to Use Potent, and Legal, Hallucinogen

By A. G. SULZBERGER and JENNIFER MEDINA

TUCSON — No one has suggested that his use of a hallucinogenic herb or any other drugs contributed to Jared L. Loughner's apparent mental unraveling that culminated with his being charged in a devastating outburst of violence here.

Yet it is striking how closely the typical effects of smoking the herb, *Salvia divinorum* — which federal drug officials warn can closely mimic psychosis — matched Mr. Loughner's own comments about how he saw the world, like his often-repeated assertion that he spent most of his waking hours in a dream world that he had learned to control.

Salvia is a potent but legal drug marketed with promises of producing a transcendental spiritual journey: out-of-body experiences, existence in multiple realities, the revelation of secret knowledge and, according to one online seller, "permanent mind-altering change in perception."

Mr. Loughner, 22, was at one point a frequent user of the plant, also known as diviner's sage, which he began smoking while in high school during a time in which he was also experimenting with marijuana, hallucinogenic mushrooms and other drugs, according to friends. Mental health professionals warn that drug use can both aggravate and mask the onset of mental illness.

"He always had it on him," said George Osler IV, whose son, Zach, was good friends with Mr. Loughner in high school. It is unclear when Mr. Loughner last used the drug.

It remains unclear what, if any, role salvia played in shaping Mr. Loughner's views. But the shootings have once again drawn attention to a drug that — for little more than the cost of a pack of cigarettes and without the hassle of showing a driver's license — a growing number of young people here and throughout much of the country are legally buying and using.

"It's a draw for adventure seekers — the people who are attracted to the sort of bungee-jumping attempt in psychopharmacology," said Matthew W. Johnson, a professor of behavioral pharmacology at Johns Hopkins University medical school, who has studied the effect of the drug on humans. "They are looking for that sort of thing as a part of their belief system. Sometimes they are extremely compelled by what they are experiencing."

A perennial in the mint family related to the ornamental plant popular with gardeners, *Salvia divinorum* is native to Mexico and has historically been used by Mazatec shamans in religious rituals, where the large green leaves are chewed or made into a tea. (Some researchers have said the herb holds promise for developing new medicine to control pain and treat drug addiction.)

Smoked, the effect is shorter and more intense, typically lasting just a few minutes.

People who have smoked the herb say the experience is often unpleasant, and many never use it again. The powerful effects have been documented in thousands of online videos documenting experiences on the drug — including a recent video of the teenage music and television star Miley Cyrus laughing hysterically and babbling nonsensically after smoking the drug. Nearly 6 percent of high school seniors and college students reported using the drug in the previous year, a higher percentage than used Ecstasy or cocaine and more than twice as much as LSD, according to a federal survey released in 2009.

“It pretty much puts you in a different world,” said Casey Hazelton, 19, describing his own experience with the drug while visiting a local smoke shop that sells packets of the herb. “It’s like you’re dreaming if you’re awake.”

Nationwide, poison centers treated 117 *Salvia divinorum* exposures in 2010, up from 81 the year before.

*Salvia*’s growing popularity has led nearly half the states to ban or restrict the sale of the herb, which is often treated with concentrated extract of the active chemical to make it more powerful. The push coincides with recent efforts by states around the country to outlaw a number of other legal drugs that often sit alongside *salvia* on the shelves that use chemical additives to mimic the effects of illegal drugs like marijuana.

“It’s an issue that the states are increasingly paying attention to,” said Alison Lawrence, policy specialist for the National Conference of State Legislatures.

In Arizona, however, *salvia* and other synthetic drugs like Spice and K2 can legally be sold to anyone, including minors, and are available at smoke shops, liquor stores and even grocery stores. The drug is also widely sold on the Internet with more potent versions accompanied by warnings like “reality is ripped to shreds.”

Eric Meyer, a doctor and member of the Arizona Legislature, has introduced bills each of the past two years to restrict the sale of *salvia* to those 21 and older (three states, including California, have age restrictions). Both years the bill died without coming to a final vote. Mr. Meyer said he planned to introduce the legislation again next week, with the hope that the increased attention would allow the bill to go forward.

“It’s a first step to get some control over the drug,” he said.

The Drug Enforcement Agency has listed salvia as a drug of concern and is considering classifying it as a Schedule I drug, like LSD or marijuana, according to the National Institutes of Health.

Madame, Monsieur,

Le présent courriel a pour but de vous informer qu'un *Avis d'intention aux parties intéressées* concernant les substances ci-dessous a été publié dans la Partie I de la *Gazette du Canada*, le 29 janvier 2011:

- *Salvia divinorum* (sauge des devins)
- Salvinorine A

La version électronique de l'Avis d'intention est disponible à l'adresse Internet [www.gazette.gc.ca](http://www.gazette.gc.ca), pages xx-xx, en format PDF (pages xxxx-xxxx dans la partie I de la *Gazette du Canada*).

Cet avis d'intention décrit la proposition de Santé Canada qui consiste à inclure la *Salvia divinorum* (sauge des devins) et la salvinorine A dans l'annexe III de la *Loi réglementant certaines drogues et autres substances*. Santé Canada cherche précisément à obtenir plus d'information de la part des intervenants afin de déterminer si ces substances ont une utilité légitime sur les plans industriel, scientifique ou médical au Canada. Les renseignements qui seront obtenus permettront de prendre des mesures réglementaires appropriées.

Si vous désirez participer à ce processus ou tout simplement nous fournir de l'information, veuillez communiquer avec nous d'ici le 28 février 2011. Vous pouvez envoyer vos commentaires par la poste à Stephanie Chandler, Division de la politique réglementaire, Bureau des substances contrôlées, indice de l'adresse : 3503D, 123 rue Slater, Ottawa, Ontario, Canada K1A 1B9, par télécopieur, au 613-946-4224, ou par courriel à [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Re: Salvia Event is on 

Jocelyn Kula to: Christine Roush

2011-01-20 05:43 PM

Cc: Dave Stephens, Cathy A Sabiston, Stephanie Szick, Denis Arsenault, Stephanie Chandler

Hi Christine,

Thanks for the intel and well, I guess we wait to hear exactly what kind of event they have in mind.

Re publication of the NOI, it is certainly no trouble to wait. CGI is published every Saturday and the cut off for submission of items is 6 business days before publication. Ergo, if we were to look at Feb 5, we would have to submit content by COB on January 29.

In the meantime, I will review the NR tonight (Stephanie and Denis have suggested some changes) and we will keep working on the IYH just in case.

Cathy- we have been consulting Suzanne on docs as you know but I will now make sure she is in the loop about an event as depending on what MO wants, she may be able to help with content from the surveillance community.

Subject: Salvia Event is on

Hi Jocelyn,

We have heard that it has been confirmed by MO that they would like an event the first week of February regarding the proposal to schedule Salvia. They also said that they do not want the NOI to be published next week. Could you please let us know when the next earliest date would be for publishing the NOI to Canada Gazette I? MO would prefer the publishing to happen after the event. Our DG, Comms has asked MO to schedule a planning meeting as soon as possible. I hope this helps to clarify things a bit.

Christine, Jocelyn:

Though I wouldn't bet any money on this, what I think has happened is that MO has received instructions from the Centre in the past 24 hours or so telling them there should be an event. Everyone in MO may not be aware of this.

002430

We have passed on the various considerations, first and foremost the likelihood that the NOI will attract media attention if it's posted on Jan 28-29....so if there's going to be an event, it'll have to be on the 28th or sooner....or publication would have to be delayed.

Dave

---

I talked to Martina in MO (only because she used to work for me so I know her- I will get in trouble if you share this info)....I was actually trying to clarify something on the med mari side, and she raised salvia (cause she was on the file at one point when she was here), and shared that her view was that Scott T had only talked about an NR, not an event.....she was going to clarify with Tim and make sure word got down (hence my reference to hopefully you have heard.....).

At the end of the day, it just seems to be extraordinary that we would organize an event regarding what, as Dave pointed out, is the beginning of a long long process.....

Please don't make a fuss about this....if your instructions are to start plans for an event, so be it, just let us know what you need from us. That said, wasn't Dave going to ask about whether an event made sense yesterday anyways??

JK

Hi Jocelyn  
We've been told that the Minister's office wants to do an event for the posting of the NOI for Salvia. We told MO the posting was going to happen on Friday, January 28th. I sent you yesterday the revised MLs, and am waiting on Stephanie C to get back with a complete answer to Q1. We have started drafting the News Release, and I can send you the first draft tomorrow am. I imagine there will be an MBU request for a teleconf at some point to discuss venue, partners, etc.

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Given its unknown effects and pharmacological similarity to other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

with a much higher rate (7.3%) in  
↓  
as per approved  
HL

Because its effects resemble those of

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## BACKGROUND - CONTEXTE

English:

### BACKGROUND / CONTEXTE

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

with a much higher rate (7.3%) in

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, ~~and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older.~~ The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

#### International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The regulation of *Salvia divinorum* will allow law enforcement to take action against illegal activities involving this substance. The possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation.

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Hi Jocelyn,

We have heard that it has been confirmed by MO that they would like an event the first week of February regarding the proposal to schedule Salvia. They also said that they **do not want the NOI to be published next week**. Could you please let us know when the next earliest date would be for publishing the NOI to Canada Gazette I? MO would prefer the publishing to happen after the event. Our DG, Comms has asked MO to schedule a planning meeting as soon as possible. I hope this helps to clarify things a bit.

Subject: Re: For Approval: Salvia Media Lines

Hi Christine,

The first bullet in the supplementary messages is somewhat problematic. We do know enough about these substances to want to control them. They are potent hallucinogens. So I would recommend the following changes:

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and very little is known about the long-term effects of these substances and their potential effects on the brain and body.

Also,

For A3 text similar to the highlight report should be used (as youth are not more likely to... they report higher prevalence)

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime with a much higher rate of use (7.3%) in youth aged 15-24.

Thanks

Suzanne

Hi Suzanne - not sure if you were copied on my earlier email, but the MO wants to do an announcement around the NOI for Salvia on Jan. 28th. Jocelyn has approved the revised media lines below, so could you please also review and let me know if you are OK with them. We have also dusted off the It's Your Health article and are updating it in anticipation of posting it to the HC website for the 28th. We are also preparing a news release to announce the NOI, and we will share this with you when ready.

Thanks,

**DRAFT**  
19/01/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.
- As a first step, Health Canada published a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I on January 29, 2011. The NOI is intended to give Canadians the opportunity to provide comments on its proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.

2011-01-24

**DRAFT**

19/01/2011

- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

#### Questions and Answers:

#### **Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current perception that these substances are a safe alternative to other illegal drugs.

#### **Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

**DRAFT**  
19/01/2011

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Deleted:** , and that youth  
**Deleted:** were much more likely to have used it than adults aged 25 years and older

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

**Deleted:** ¶

A4 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities will be illegal unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies will also be able to take action against suspected illegal activities involving these substances.

As a plant with hallucinogenic properties, however, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products may be subject to compliance and enforcement action under the *Food and Drugs Act*.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

**DRAFT**  
19/01/2011

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

History: This message has been forwarded.

Hi Jocelyn,

I have HPFB approval of the Salvia MLs and thought you might like to review quickly their comments and changes and let me know if you are OK with them. I gather nothing is moving forward to Cathy until we have more direction from MO. The draft NR is still in your shop, and we have started drafting a Ministerial Event Proposal.

Cheers,

Salvia MLs\_Jan21(4)\_DCVIU16h07.doc

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Comment [D1]:** Suggest to add a line about why there is a risk to the health of Canadians. Abuse potential? Addiction?

**Supplementary Messages:**

- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

**Comment [D2]:** Suggest to remove. It is considered an NHP and subject to the NHPR.

**DRAFT**  
21/01/2011

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

**Comment [D3]:** Replace with "misconception"

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

**Comment [D4]:** Replace with "there is no requirement for them to be regulated"

**Deleted:** C:\WINDOWS\TEMP\notes20AA4E\Salvia MLs\_Jan20(4)\_rev(ek)ENG NHPD edits RMarles approved.doc

**Deleted:** 2011-01-21

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark,

**DRAFT**  
21/01/2011

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A4 – Health Canada proposes to include *Salvia divinorum* and salvinorin A under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities would be illegal unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies would also be able to take action against suspected illegal activities involving these substances.

**Comment [D5]:** It is considered an NHP – it is illegal? It is a contravention of the FDR/NHPR to sell and unlicensed and unapproved product. No licences have been granted for these products.

However, as a plant with hallucinogenic properties, *Salvia divinorum* currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act and its associated regulations*.

**Formatted:** Font: Not Italic

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement

action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Comment [D6]:** No link here. Is this coming?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

#### International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

#### Current Situation in Canada

Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted, namely:

- International requirements and trends in control and/or scheduling;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, scientific, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *S. divinorum* and its main active ingredient salvinorin A against the aforementioned factors and now proposes to include both substances in Schedule III to the CDSA.

The regulation of *Salvia divinorum* will allow law enforcement to take action against illegal activities involving this substance. The possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation.

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada. However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Scientific reports ~~have~~ also suggest that it has the potential for abuse.

### Salvia divinorum

#### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recent ~~there have been~~ reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. [As of DATE 2011] Health Canada has not authorized for sale any products containing *S. divinorum*.

Health Canada recommends that you avoid using this plant because ~~very little is known about the effects it may have on your body and/or brain functions.~~ There is also no way to predict how it will affect you with each use.

Moreover, ~~Canadian surveillance data and scientific reports have indicated that *S. divinorum* has the potential for abuse.~~ As a result, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient, salvinorin A under Schedule III to the Controlled Drugs and Substances Act (CDSA) in order to protect the health and safety of Canadians, particularly youth.

wld recommen to delete, seems out of place here ....

Comment [S1]: Have removed as it repeats content of "Minimizing your Risk" section.  
Formatted: Font: Not Italic

In light of this information

#### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

They are hallucinogenic and very little is know about the long term effects of these substances on the brain and body.  
(consistent with Suzanne's comments on media lines)

Gain why advertise that is still legal?  
DR perhaps rephrase so that appears as  
In the long term, Health Canada is taking steps to regulate S. div. and Salv A under ie C.D. - S. A. - "

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "Need More Info?" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of ~~DATE~~ 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

- Formatted: Font: Italic
- Formatted: Font: Italic
- Formatted: Highlight
- Formatted: Font: Italic
- Formatted: Font: Italic
- Formatted: Font: Italic

While ~~neither~~ *S. divinorum* ~~nor~~ salvinorin A ~~are~~ <sup>are</sup> currently regulated under the *Controlled Drugs and Substances Act* (CDSA), ~~However, after reviewing the available information regarding these substances, Health Canada is proposing to add *S. divinorum* and its main active ingredient, salvinorin A, to Schedule III to the CDSA. Because of their~~ <sup>its</sup> hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized

now developing a regulatory proposal that would add....

for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:

- \*a Natural Product Number (NPN); or
- \*an Exemption Number (EN); or
- \*a Drug Identification Number – Homeopathic Medicine Number (DIN-HM).

Formatted: Bullets and Numbering

As of ~~DATE~~ 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, ~~Italy~~ Italy and ~~Japan, etc.~~, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

add space →

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. ~~For example,~~ In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

#### **Background**

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to

have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15yr olds have used *S. divinorum* in the past year. For more information on these surveys, see the *Need More Info* section below.

and particularly, the risk to youth,

as controlled substances.

### Health Canada's Role

Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. In light of the ~~potential~~ health and safety risks associated with the use of *S. divinorum*, Health Canada ~~proposes to~~ <sup>is taking steps to</sup> include *S. divinorum* and salvinorin A under Schedule III of the CDSA. As a first step in ~~the process of regulating these substances,~~ <sup>regulate</sup> Health Canada issued a *Notice to Interested Parties* (NOI) on January 29, 2011, ~~outlining its proposal to schedule these substances under the CDSA~~. This will assist in determining Health Canada's future approach to decision-making regarding the regulation of *S. divinorum* in Canada. In the interim, Health Canada also ~~will~~ continues to monitor the sale of unauthorized health products, ~~including those that contain *S. divinorum* or its main active ingredient salvinorin A,~~ <sup>It</sup> and will take appropriate action when ~~the Department~~ <sup>should it</sup> becomes aware of any unauthorized health products that may pose a risk to Canadians.

this

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

**Deleted:** ly there have been reports suggesting

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

**Formatted:** Font: Italic

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Deleted:** As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

**Comment [S1]:** Have removed as it repeats content of "Minimizing your Risk" section

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

**Deleted: ¶**  
Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

**Deleted:** ¶

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "Need More Info?" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of [redacted] 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

Deleted: Because of their

Deleted: its

Deleted: hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following: ¶ a Natural Product Number (NPN); or ¶ an Exemption Number (EN); or ¶ a Drug Identification Number - Homeopathic Medicine Number (DIN-HM). ¶

Deleted: As of [redacted] 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department. ¶

¶ Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted. ¶

Deleted: Italy

Deleted: ,

Deleted: , etc..

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

Deleted: it

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

Deleted: Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15yr olds have used *S. divinorum* in the past year.

### Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum*, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada issued a *Notice to Interested Parties (NOI)* on February 5, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

and particularly the risks to youth

Deleted: Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home.

Formatted: Font: Italic

# News Release

## The Government of Canada Proposes to Regulate *Salvia Divinorum* and Salvinorin A as Controlled Substances

January 28, 2011  
For immediate release

**OTTAWA** – Today, the Honourable Leona Aglukkaq, Minister of Health announced that the Government of Canada intends to regulate *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 5, 2011.

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body," added Aglukkaq.

The Notice to Interested Parties will propose that ~~*Salvia divinorum* and its main active ingredient salvinorin A~~ be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, importation, exportation, and production will be illegal unless authorized by regulation. ~~The regulation of *Salvia divinorum* and salvinorin A will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.~~

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 7, 2011.

## The Government of Canada Proposes to Regulate Salvia Divinorum and Salvinorin A as Controlled Substances

January 28, 2011  
For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health ~~announced that released a Notice to Interested Parties, also known as a Notice of Intent, would be published in the Canada Gazette, Part I, on January 29, 2011. The Notice outlines Health Canada's proposal to regulate Salvia divinorum and salvinorin A, also known as Salvia, as controlled substances.~~

*that announced the CIOC intends to regulate*

Formatted: Font: Italic

*A No. I will be published in the ... on*

*[DATE]*

This Notice will provide interested stakeholders with the opportunity to comment on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

"After reviewing available information Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is a serious concern for all Canadians to Health Canada because as not enough very little is known about the long-term effects of *Salvia divinorum*," added Aglukkaq.

DRAFT  
21/01/2011

## Media Lines *Salvia divinorum*

### Issue

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### Key Messages:

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

### Supplementary Messages:

- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

**Comment [D1]:** Suggest to add a line about why there is a risk to the health of Canadians. Abuse potential? Addiction?

**Comment [S2]:** OCS feels that the second bullet addresses this. Could possibly reword first two bullets as follows: 1) After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to regulate *Salvia divinorum* and its main active ingredient as controlled substances. 2) The Government of Canada is taking these steps in order to protect the health and safety of Canadians, including youth, from its potentially harmful effects.

**Comment [D3]:** Suggest to remove. It is considered an NHP and subject to the NHPR.

**Comment [S4]:** Technically this comment is true (as we got the text from all those questions in previous media inquiries) if you consider the first bullet in the section only, but if you go on to read the remaining bullets the choice of words seems to be clarified. OCS would suggest that if HPPFB does not like the order of bullets, they could suggest how to change them.

21/01/2011

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act (CDSA)* is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark,

**Comment [D5]:** Replace with "misconception"

**Comment [S6]:** OK with this change.

**Comment [D7]:** Replace with "there is no requirement for them to be regulated"

**Comment [S8]:** OK with this change.

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)* which only became available in 2010,

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A,

**Comment [D9]:** It is considered an NHP – it is illegal? It is a contravention of the FDR/NHPR to sell and unlicensed and unapproved product. No licences have been granted for these products.

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Comment [D10]:** No link here. Is this coming?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;

**Salvia divinorum**

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.
- However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

**Comment [D1]:** Suggest to add a line about why there is a risk to the health of Canadians. Abuse potential? Addiction?

**Comment [HC2R1]:** The second bullet says what the risk is.....could possibly reword first two bullets as follows: 1) After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, HC is proposing to regulate *Salvia divinorum* and its main active ingredient as controlled substances. 2) The Government of Canada is taking these steps in order to protect the health and safety of Canadians, including youth, from its potentially harmful effects.

**Comment [D3]:** Suggest to remove. It is considered an NHP and subject to the NHPR.

**Comment [HC4]:** Technically I guess this comment is true (as we got the text from all those questions in previous media enquiries) if you consider the first bullet in this section only, but if you go on to read the remaining bullets, the choice of words is clarified? I would suggest that if HPFB does not like the order of bullets in this section, they suggest how to change things.....

**DRAFT**

21/01/2011

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark,

**Comment [D5]:** Replace with "misconception"

**Comment [HC6]:** OK with this suggestion

**Comment [D7]:** Replace with "there is no requirement for them to be regulated"

**Comment [HC8]:** OK with this change

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why hasn't it taken action until now?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is further to under Schedule III to the CDSA. Further to the regulation of these substances under the CDSA, the following activities would be illegal unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies would also be able to take action against suspected illegal activities involving these substances.

However, as a plant with hallucinogenic properties, *Salvia divinorum* currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act and its associated regulations*.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement

**Comment [D9]:** It is considered an NHP – it is illegal? It is a contravention of the FDR/NHPR to sell and unlicensed and unapproved product. No licences have been granted for these products.

**Comment [HC10]:** Stephanie- what do you think about reworking the answer to say the move to regulate S and Sal A as controlled substances is based on surveillance data that only became available in 2010. Then we would remove the staff about impacts of regulating as controlled substances, but then go straight to something about in the interim, S currently meets the definition of an NHP.... The Department has always had the ability to take compliance and enforcement action under the FDA etc.....

action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Comment [D11]:** No link here. Is this coming?

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

**DRAFT**

21/01/2011

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**Just saw this -- - two things**

- 1) how likely does it look to have the IYH article ready, coded and posted in both languages on the HC website by/before Saturday, Feb. 5/11??
- 2) The NOI is done and DG-approved - it is not in development -- it is also referenced in the main box at the top, so suggest deleting it.

Please see my changes in red in the bottom box.

**Subject:** Salvia docs

Hi Christine

Please find attached the latest version of the media lines for Salvia, which incorporate our suggested changes further to comments from HPFB, and our comments on the draft NR you prepared.

[attachment "Salvia NR\_Jan 27\_OCS.doc" deleted by Christine Roush/HC-SC/GC/CA]

[attachment "Salvia MLs\_Jan27\_OCS.doc" deleted by Christine Roush/HC-SC/GC/CA]

For reference, I am attaching the QP note that we have updated in preparation for the house coming back into session.

(Note Cathy has not reviewed this yet but it is consistent with the media lines and the NOI text that have both been discussed with Cathy informally.)

What I don't seem to have is a copy of the updated NOI, so by copy of this message, I am asking Stephanie C to send it to you, as it has now been through Suzanne Desjardins' office for review.

Lastly, I am attaching a copy of the updated IYH (text now matches the key messages in the MLs and the gist of the NR etc.....). Please feel free to put this document back into approvals (I assume with HPFB) but please note that under no circumstances, should progress on this document impede publication of the NOI. We have clarified this with Cathy. If by some chance, the IYH can be ready for posting soon after the announcement/ NOI, so be it, but we are to plan for publication of the NOI on Sat. Feb 12.

[attachment "IYH Salvia divinatorum\_v19 Jan 27.doc" deleted by Christine Roush/HC-SC/GC/CA]

Please note that I am out of the office on annual leave tomorrow. Stephanie and Denis are around if you have questions however, and I am back in the office on Monday. From my perspective, the most pressing piece to move on is the NR and media lines, and Cathy's office knows to expect them sometime tomorrow.

Jocelyn

Hi Jocelyn,  
I have HPFB approval of the Salvia MLs and thought you might like to review quickly their comments and changes and let me know if you are OK with them. I gather nothing is moving forward to Cathy until we have more direction from MO. The draft NR is still in your shop, and we have started drafting a Ministerial Event Proposal.

Cheers,

Subject: Re: Salvia Announcement

Jocelyn - since we have a tentative date from MO for this announcement - Feb. 10th - can we get the products (News Release, MLs & Qs&As and It's Your Health article) moving through approvals now. We

were told that there won't be an event, just a news release announcing the NOI.

# News Release

## The Government of Canada Proposes to Regulate Salvia Divinorum and Salvinorin A as Controlled Substances

February 10, 2011

For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health announced that the Government of Canada intends to regulate *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 12, 2011.

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body," added Aglukkaq.

The Notice to Interested Parties will propose that *Salvia divinorum* and salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, importation, exportation, and production will be illegal unless authorized by regulation. Regulating Salvia as a controlled substance will also enable law enforcement agencies to take action against suspected illegal activities involving this substance.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 14, 2011.

DRAFT  
21/01/2011

**Media Lines**  
*Salvia divinorum*

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada, unless it is being sold as a hallucinogen. If this were the case, the product would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Comment [D1]:** Suggest to add a line about why there is a risk to the health of Canadians. Abuse potential? Addiction?

**Comment [S2]:** OCS feels that the second bullet addresses this. Could possibly reword first two bullets as follows: 1) After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to regulate *Salvia divinorum* and its main active ingredient as controlled substances. 2) The Government of Canada is taking these steps in order to protect the health and safety of Canadians, including youth, from its potentially harmful effects.

**Formatted:** Indent: Left: 0 cm, Hanging: 1.27 cm, Bulleted + Level: 1 + Aligned at: 0.32 cm + Tab after: 0 cm + Indent at: 0.32 cm

**Comment [D3]:** Suggest to remove. It is considered an NHP and subject to the NHPR.

**Comment [S4]:** We are simply responding to all the past media enquiries. In any case, the focus of these lines is to support issuance of NOI not highlight NHP status.

**Deleted:** ¶

**DRAFT**  
21/01/2011

**Questions and Answers:**

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some

DRAFT  
21/01/2011

individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Comment [D5]:** It is considered an NHP – it is illegal? It is a contravention of the FDR/NHPR to sell and unlicensed and unapproved product. No licences have been granted for these products.

**Comment [S6]:** OCS feels that the second paragraph in this answer addresses the question

**Deleted:** Health Canada proposes to include

**DRAFT**  
21/01/2011

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Comment [D7]:** No link here. Is this coming?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- the use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

**Comment [S1]:** Please note that OCS has clarified with Cathy that, while the IYH is important, it should not hold up the publication of the NOI. Its posting can follow soon after the NOI is published.

**Deleted:** ly there have been reports suggesting

**Deleted:** Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

**Formatted:** Font: Italic

**Deleted:** As of [REDACTED] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

**Deleted:** ¶ Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

**Deleted:** ¶

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "Need More Info?" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of [REDACTED] 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

Deleted: its
Deleted: hallucinogenic properties, products containing <i>S. divinorum</i> or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the <i>Natural Health Products Regulations</i> and the definition of a drug under the <i>Food and Drugs Act</i> . It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following:¶ a Natural Product Number (NPN); or¶ an Exemption Number (EN); or¶ a Drug Identification Number - Homeopathic Medicine Number (DIN-HM). ¶
Deleted: As of [REDACTED] 2010 no products containing <i>S. divinorum</i> or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department. ¶ Neither <i>S. divinorum</i> nor salvinorin A are currently regulated under the <i>Controlled Drugs and Substances Act</i> (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted.¶
Deleted: Italy
Deleted: ,
Deleted: , etc.,

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

Deleted: For example, i

Deleted: it

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

Deleted: Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the Canadian 2008-2009 Youth Smoking Survey show that 5% of 15yr olds have used *S. divinorum* in the past year.

### Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada issued a *Notice to Interested Parties (NOI)* on February 5, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

Deleted: Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home.

**DROGUES - SALVIA DIVINORUM**

---

**SYNOPSIS - SOMMAIRE**

English:

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows the young celebrity Miley Cyrus smoking Salvia divinorum. Canadian surveillance data indicates that this substance is being used by adolescents and young adults for its hallucinogenic properties, and there have also been several reports from scientific sources indicating that Salvia divinorum has a potential for abuse.

**ANTICIPATED QUESTION - QUESTION PRÉVUE**

English:

What is Health Canada doing to protect young Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les jeunes Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

---

English:

- Health Canada is proposing to regulate Salvia as a controlled substance in order to protect the health and safety of Canadians, particularly youth.
- Health Canada has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate Salvia as a controlled substance.
- The regulation of Salvia will make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.

Français:

---

## **BACKGROUND - CONTEXTE**

English:

### **BACKGROUND / CONTEXTE**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination

- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

Current Situation in Canada

The plant *Salvia divinorum* is not currently regulated under the *Controlled Drugs and Substances Act* (CDSA) and therefore the plant is not considered to be "banned" nor are activities with it considered to be illegal in Canada unless it is being sold as a hallucinogen. If this were the case, the product would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

In light of the surveillance data and scientific reports regarding its potential for abuse, Health Canada has determined that *S. divinorum* and Salvinorin A should be included in Schedule III to the CDSA. This means that the possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A will be illegal unless authorized by regulation. The regulation of *Salvia divinorum* and Salvinorin A as controlled substances will allow law enforcement to take action against illegal activities involving this substance.

## RPD Telephone Enquiry

**Date of Call:** January 27, 2011

**Subject:** Status of *Salvia divinorum* and whether we are assessing it

**Language of Correspondence:** English

s.19(1)

**Caller Name:** [REDACTED]

**Caller Organization:** Saskatchewan Drug Information Services

**Caller Telephone Number:** [REDACTED]

### CALL SUMMARY:

[REDACTED] of Saskatchewan Drug Information Services called to enquire as to the status of *Salvia divinorum* and when it is considered a natural health product as she felt that there had been confusion in media reports. [REDACTED] also inquired as to whether it was true that Health Canada is currently assessing this substance.

I informed [REDACTED] that as *Salvia divinorum* is not scheduled under the *Controlled Drugs and Substances Act* it is not considered to be illegal in itself. However, because *Salvia divinorum* is a plant with hallucinogenic properties and can affect brain function, it is considered a natural health product under the *Natural Health Product Regulations* when it is marketed as such.

I also informed the caller that Health Canada is currently assessing *S. divinorum* to determine what measures (if any) Health Canada should take in order to control this substance.

The caller also asked if there are any other plants that are the same species as *Salvia divinorum*. I stated that while *Salvia divinorum* is a type of sage, I did not have enough knowledge of plant species to adequately answer her question. I offered to find a contact for her that could be of assistance, but she said that it was not necessary.

Hi Stephanie,

Suzanne Desjardins had some minor comments on the NOI, so it has been revised and translated. It was sent up to DGO in a docket yesterday. (Please note that there are 4 copies of the NOI in the docket - 2 French, 2 English - and all 4 require Cathy's signature.

And yes, in order for the NOI to be published on Feb 12th, it needs to be with Canada Gazette by noon Friday February 4th.

Regards,

Stephanie

hi both,

Can you confirm (and I need a memory refresh I'm afraid!) -- Cathy has signed the NOI? I understand this needs to land with CG folks next Friday if we are to be in CG1 on Sat. Feb. 12.

If she hasn't -- let me know and we can get that today hopefully.

Thanks, Stephanie

Hi Christine

Please find attached the latest version of the media lines for Salvia, which incorporate our suggested changes further to comments from HPFB, and our comments on the draft NR you prepared.

[attachment "Salvia NR\_Jan 27\_OCS.doc" deleted by Stephanie Szick/HC-SC/GC/CA] [attachment "Salvia MLs\_Jan27\_OCS.doc" deleted by Stephanie Szick/HC-SC/GC/CA]

For reference, I am attaching the QP note that we have updated in preparation for the house coming back into session.

(Note Cathy has not reviewed this yet but it is consistent with the media lines and the NOI text that have both been discussed with Cathy informally.)

What I don't seem to have is a copy of the updated NOI, so by copy of this message, I am asking Stephanie C to send it to you, as it has now been through Suzanne Desjardins' office for review.

Lastly, I am attaching a copy of the updated IYH (text now matches the key messages in the MLs and the gist of the NR etc.....). Please feel free to put this document back into approvals (I assume with HPFB) but please note that under no circumstances, should progress on this document impede publication of the NOI. We have clarified this with Cathy. If by some chance, the IYH can be ready for posting soon after the announcement/ NOI, so be it, but we are to plan for publication of the NOI on Sat. Feb 12.

[attachment "IYH Salvia divinatorum\_v19 Jan 27.doc" deleted by Stephanie Szick/HC-SC/GC/CA]

Please note that I am out of the office on annual leave tomorrow. Stephanie and Denis are around if you have questions however, and I am back in the office on Monday. From my perspective, the most pressing piece to move on is the NR and media lines, and Cathy's office knows to expect them sometime tomorrow.

DRAFT  
2/1/2011  
PJ

**Media Lines**  
**Salvia divinorum**

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Key Messages:**

- Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA).
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of this substance
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Comment [D1]:** Suggest to add a line about why there is a risk to the health of Canadians. Abuse potential? Addiction?

**Comment [S2]:** OCS feels that the second bullet addresses this. Could possibly reword first two bullets as follows: 1) After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to regulate *Salvia divinorum* and its main active ingredient as controlled substances. 2) The Government of Canada is taking these steps in order to protect the health and safety of Canadians, including youth, from its potentially harmful effects.

**Supplementary Messages:**

• The plant *Salvia divinorum* is not currently regulated under the CDSA and therefore it is not considered to be "banned", nor are activities with it considered to be illegal in Canada.

*unless it is being sold as a hallucinogen*

• However, as *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*, when marketed as a hallucinogen.

*gen. If this were the case, the product would meet the*

• To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

**Comment [D3]:** Suggest to remove. It is considered an NHP and subject to the NHPR.

**Comment [S4]:** Technically this comment is true (as we got the text from all those questions in previous media inquiries) if you consider the first bullet in the section only, but if you go on to read the remaining bullets the choice of words seems to be clarified. OCS would suggest that if HPPF does not like the order of bullets, they could suggest how to change them...

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act (CDSA)* is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark,

**Comment [D5]:** Replace with "misconception"

**Comment [S6]:** OK with this change

**Comment [D7]:** Replace with "there is no requirement for them to be regulated"

**Comment [S8]:** OK with this change

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

Add comment  
OCS feels that  
2nd para in the  
answer  
addresses  
the question

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Comment [D9]:** It is considered an NHP – it is illegal? It is a contravention of the FDR/NHPR to sell and unlicensed and unapproved product. No licences have been granted for these products.

**Deleted:** Health Canada proposes to include

**Formatted:** Font: Italic

**Formatted:** Font: Italic

**Formatted:** Font: Italic

**Comment [S10]:** CADUMS included Salvia in 2008

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

**Deleted:** under Schedule III of the CDSA. Further to the regulation of these substances under the CDSA, the following activities would be illegal unless authorized by regulation: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). Law enforcement agencies would also be able to take action against suspected illegal activities involving these substances.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. ~~To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient.~~ The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

**Comment [D11]:** No link here. Is this coming?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;

# News Release

## The Government of Canada Proposes to Regulate Salvia Divinorum and Salvinorin A as Controlled Substances

~~[DATE]~~ February 10, 2011  
~~February 6, 2011~~

For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health announced that the Government of Canada intends to regulate *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 5, 2011.

“After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance,” said Minister Aglukkaq. “The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body,” added Aglukkaq.

The Notice to Interested Parties will propose that *Salvia* and *Salvinorin A* be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, importation, exportation, and production will be illegal unless authorized by regulation. Regulating *Salvia* as a controlled substance will also enable law enforcement agencies to take action against suspected illegal activities involving this substance.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by ~~March 7, 2011~~.

For more information on *Salvia divinorum*, please visit: ~~It's Your Health - Salvia divinorum~~. ~~XXX~~

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

move to be 1st sentence in para

Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse. ~~Certain websites are also promoting~~ the use of *S. divinorum* as a "legal" alternative to street drugs.

Deleted: ly there have been reports suggesting

Canadians should not use products containing *S. divinorum* and/or salvininorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

Formatted: Font: Italic

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvininorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

Deleted: As of [redacted] 2010 Health Canada has not authorized for sale any products containing *S. divinorum*.

Comment [S1]: Have removed as it repeats content of "Minimizing your Risk" section

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

Deleted: ¶ Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use.

Deleted: ¶

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

Note, pls make sure Christine understands that we have clarified with Cathy that while the 1YH is important, it

Its posting can be done after

S 002543

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "Need More Info?" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of [REDACTED] 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

**Deleted:** hallucinogenic properties, products containing *S. divinorum* or salvinorin A meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell drugs or NHPs in Canada, unless they have been reviewed and authorized for sale by Health Canada. In the case of NHPs, they need to be labelled with one of the following: ¶ a Natural Product Number (NPN); or ¶ an Exemption Number (EN); or ¶ a Drug Identification Number - Homeopathic Medicine Number (DIN-HM). ¶

**Deleted:** As of [REDACTED] 2010 no products containing *S. divinorum* or salvinorin A have been authorized by Health Canada for sale. The sale of unauthorized drugs and NHPs is illegal, and may be subject to compliance and enforcement actions by the Department. ¶

¶ Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is currently considering the available information to determine whether regulation as a controlled substance is warranted. ¶

**Deleted:** Italy

**Deleted:** ,

**Deleted:** , etc.,

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

Deleted: For example, i

Deleted: it

### Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

Deleted: Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, less than 2% of Canadians age 15 and older reported having used *S. divinorum* at least once in their lifetime. Youth, ages 15-24 were much more likely to have used it than adults. The results from the *Canadian 2008-2009 Youth Smoking Survey* show that 5% of 15yr olds have used *S. divinorum* in the past year.

### Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada issued a *Notice to Interested Parties (NOI)* on February 5, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

Deleted: Health Canada continues to collect and consider safety information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home.

Thanks Stephanie

Cathy has it - will let you know once she has signed all four copies.

So you know, she has asked that I touch base with ADMO to ensure this is moving ahead - as she is the signatory on the NOI, from there it would go to CG folks -- she wants confirmation this is going ahead for the Feb. 12 date, with the news release on Feb. 10

Will keep you posted.

FYI

I just spoke with Christine Roush regarding the Salvia comms products and she indicated that she was going to send the MLs back to HPFB for Director approvals before they would go to Cathy for her approval. So its likely DGO won't seem them again until early next week.

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDAS). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDAS.

Des rapports ont récemment été publiés, indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, et que les jeunes âgés de 15 à 24 ans étaient beaucoup plus nombreux à en avoir consommé que les adultes âgés de 25 ans ou plus. Les résultats de l'*Enquête sur le*

---

*la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Étant donné ses effets inconnus, ainsi que sa similarité pharmacologique avec d'autres substances comprises dans l'annexe III de la LRCDAS, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no<sup>o</sup>10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'ONU sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## DEPARTMENT OF HEALTH

### CONTROLLED DRUGS AND SUBSTANCES ACT

#### *Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. ~~and that youth aged 15-24 were much more likely to have used it than adults aged 25 years and older.~~ The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. ~~Given its unknown effects and pharmacological similarity to~~ Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum*

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCIDAS). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCIDAS.

Des rapports ont récemment été publiés/ indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, ~~et que les jeunes âgés de 15 à 24 ans, étaient beaucoup plus nombreux à en avoir consommé que les adultes âgés de 25 ans ou plus.~~ Les résultats de l'*Enquête sur le*

~~la consommation de drogues et la santé des élèves de l'Ontario (SCDSEO) de 2009 indique que~~ la consommation de drogues et la santé des élèves de l'Ontario (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. ~~Étant donné ses effets inconnus, ainsi que sa similarité pharmacologique avec~~ d'autres substances comprises dans l'annexe III de la LRCIDAS, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no°10, pp. 1634-1639.

avec un taux de consommation important (7,3%)

Puisque ses effets psychotrope sont

l'Organisation des Nations Unies

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'~~ONU~~ sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## DEPARTMENT OF HEALTH

### CONTROLLED DRUGS AND SUBSTANCES ACT

#### *Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the Canadian 2008-2009 *Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and

---

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Madame, Monsieur,

Le présent courriel a pour but de vous informer qu'un *Avis d'intention aux parties intéressées* concernant les substances ci-dessous a été publié dans la Partie I de la *Gazette du Canada*, le 29 janvier 2011:

- *Salvia divinorum* (sauge des devins)
- Salvinorine A

La version électronique de l'Avis d'intention est disponible à l'adresse Internet [www.gazette.gc.ca](http://www.gazette.gc.ca), pages xx-xx, en format PDF (pages xxxx-xxxx dans la Partie I de la *Gazette du Canada*).

Cet avis d'intention décrit la proposition de Santé Canada qui consiste à inclure la *Salvia divinorum* (sauge des devins) et la salvinorine A dans l'annexe III de la *Loi réglementant certaines drogues et autres substances*. Santé Canada cherche précisément à obtenir plus d'information de la part des intervenants afin de déterminer si ces substances ont une utilité légitime sur les plans industriel, scientifique ou médical au Canada. Les renseignements qui seront obtenus permettront de prendre des mesures réglementaires appropriées.

Si vous désirez participer à ce processus ou tout simplement nous fournir de l'information, veuillez communiquer avec nous d'ici le 28 février 2011. Vous pouvez envoyer vos commentaires par la poste à Stephanie Chandler, Division de la politique réglementaire, Bureau des substances contrôlées, indice de l'adresse : 3503D, 123 rue Slater, Ottawa, Ontario, Canada K1A 1B9, par télécopieur, au 613-946-4224, ou par courriel à [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

**VEUILLEZ TRANSFÉRER LE PRÉSENT COURRIEL AUX PERSONNES QUI POURRAIENT ÊTRE INTÉRESSÉES.**

Si vous avez reçu cet avis par erreur, nous vous saurions gré de le transférer à la personne concernée de votre organisation et de lui demander de nous en informer par courriel à : [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Division de la politique réglementaire  
Bureau des substances contrôlées

Direction générale de la santé environnementale et de la sécurité des consommateurs

Dear Sir/Madam:

The purpose of this email is to advise you that a *Notice of Intent to Interested Parties* (NOI) regarding the following substances was published in the *Canada Gazette*, Part I (CGI) on January 29, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:

<http://canadagazette.gc.ca/> pages xx-xx in PDF format (pages xxxx-xxxx in *Canada Gazette*, Part I). CGI

This NOI outlines Health Canada's proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulatory controls.

If you are interested in this process or wish to provide us with information for our consideration please do so by February 28, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

PLEASE FORWARD THIS EMAIL TO OTHERS WHO MAY BE INTERESTED.

Should this notification have reached you in error, it would be appreciated if you could please forward it to the appropriate person in your organization and ask that person to inform us of this by sending an e-mail to: [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Thank you,

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

#### *Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDas). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDas.

Des rapports ont récemment été publiés indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, avec un taux de consommation plus important (7,3%) parmi les jeunes âgés de 15 à 24 ans. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au

---

élèves de l'Ontario (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no<sup>o</sup>10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

cours de la dernière année. De plus, le *Sonage sur la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no<sup>o</sup>10, pp. 1634-1639. 002571

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

#### *Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDas). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDas.

Des rapports ont récemment été publiés indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, avec un taux de consommation plus important (7,3%) parmi les jeunes âgés de 15 à 24 ans. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au

cours de la dernière année. De plus, le sondage sur la consommation de drogues et la santé des élèves de l'Ontario (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no°10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). ~~La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas~~ permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

L'ajout  
la mise  
en annexe.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and

---

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the pose of exportation, and production (or cultivation). The scheduling of *S. divinorum* and vinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

hello both,

Good news - Cathy has signed all four copies of the NOI.

Paula will be audit trailing the docket back to OCS.

I will send to Jesse in ADMO, a PDF of the signed NOI and the routing slip - will keep you posted on any feedback she gets from snr. management on this - i.e. proceeding with the NOI for Feb. 12.

Thanks again for all your quick work on this yesterday and today.

Hi Cathy,

It's been a long (and windy) road, but finally we have the salvia products below for your approval. They have been signed off at the DG level in HPFB by the NHPD, the Inspectorate and Marketed Health Products. MO would like the NR issued on February 18th, so hopefully you'll be able to review and approve before your upcoming leave.

# News Release

## **The Government of Canada Proposes to Regulate *Salvia Divinorum* and Salvinorin A as Controlled Substances**

**February 18, 2011**  
**For immediate release**

**OTTAWA** – Today, the Honourable Leona Aglukkaq, Minister of Health announced that the Government of Canada intends to regulate *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 19, 2011

“After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance,” said Minister Aglukkaq. “The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body,” added Aglukkaq.

The Notice to Interested Parties will propose that *Salvia divinorum* and salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, importation, exportation, and production (or cultivation) will be illegal unless authorized by regulation. Regulating *Salvia divinorum* and salvinorin A as a controlled substance will also enable law enforcement agencies to take action against suspected illegal activities involving this substance.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 14, 2011.

**DRAFT**  
01/02/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011

**Key Messages:**

- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from their potentially harmful effects.
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the CDSA will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently regulated under the CDSA. At the present time, products containing *Salvia divinorum* that indicate its hallucinogenic properties would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**DRAFT**  
01/02/2011

## **Questions and Answers:**

### **Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs.

### **Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also

**DRAFT**  
01/02/2011

placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why is it not controlled under the Controlled Drugs and Substances Act?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**DRAFT**

01/02/2011

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come)

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using *Salvia* in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## **Salvia divinorum**

### **Issue**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you avoid using *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "***Need More Info?***" section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada issued a *Notice to Interested Parties (NOI)* on February 19, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short and long-term in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Deleted: -acting

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Hi Jocelyn,

For the PRAD email account, while the old format with the underscores still seems to function, the address also functions with the underscores replaced by periods. For the sake of consistency, we will use the period format.

We will explore asap whether there are any associations for natural food stores or alternative lifestyle shops that could be added to the list of stakeholders.

two comments:

do we not need to update the PRAD email address to have "."s in it rather than "\_"s in it?

for the list of stakeholders, what about looking for an association of natural health food stores (I doubt there is an association for head shops), or an association for alternative life style stores.....just that retailers are who are most likely to be impacted....

Hi Jocelyn,

For publication on February 19, we need to have the package delivered to *Canada Gazette* by noon on

Friday, February 11. While the copies of the NOI that Cathy signed are dated January 28, these probably don't need to be re-signed (to be confirmed with Stephanie) as it is the covering letter to *Canada Gazette* that indicates the date on which we want the NOI published.

Unlike the NOI, the covering letter would be signed by yourself and can thus be easily amended here in OCS to reflect the new target date of February 19.

As for the list of stakeholders, Stephanie submitted to me a final list of stakeholders which I approved with a few minor modifications. The actual message we would send up is approved and ready to go.

I will work with Carmen to set-up a bilat.

so when do we have to have our package with the CG office by for publication on Feb 19.  
also: 1) do we need to get Cathy to resign the hard copies (I didn't think they were dated but pls advise)  
2) how are things going with list of stakeholders to send message out to re NOI?

It seems that we have not had a bilat in ages so perhaps you should check with Carmen re arranging one?

Re, use vs consume. This wording is consistent with other drug-related IYHs and the fact that generally speaking, people talk about using (or taking) a drug (medicinal or illicit), not consuming it. Allowing for the fact that language is supposed to be Grade 8, I vote for sticking with "use".

Re. citing where substances are sold, we are not providing any more information than what is already splashed all over the internet, and I don't see this as causing any more of a risk than doing a NR to say that we are moving to schedule but this will take time, i.e, it is still legal for a bit.....

Re. the weblink to the NOI, sending people to [www.canadagazette.gc.ca](http://www.canadagazette.gc.ca) is a minefield as the search engine on the site is very hard to use.....generally speaking, once we have the official link to the specific page from the Gazette office, we provide to comms for reference in their lines.

In the NR, not sure why we are now removing the reference to "also known as Salvia" when in fact, that is how 99% of the media reports and internet sites refer to it?

Christine,

Only to clarify that your statement about where salvia can be sold is not quite right. It is not illegal under the FDA to sell salvia in head shops or natural health stores because there are no approved products, it is illegal to sell in those establishments when it is specifically sold as a hallucinogen, which is when the definition of an NHP comes into play, and the requirement for authorization under the FDA kicks in. Technically, someone selling salvia as a herbal incense product in a natural health store would not be doing anything illegal.

It has taken us all a long time to get our heads around this I know.....

Cathy,

IYH doesn't have a lot of articles on controlled substances but the article on Opioids does state:

"Opioid medications come in many forms, including tablets, capsules, syrups, solutions, nasal sprays, skin patches and suppositories. The strength of the opioid in these medications varies greatly, and most

are available in Canada by prescription only. However, some products containing very low doses of the opioid codeine, combined with at least two other medicinal ingredients, can be purchased directly from a pharmacist."

I think there are good points to leaving it in and taking it out. Originally I think it was included to warn parents that it was available (and where) - as most people who would use it already know where to get it. However, I would probably change the wording as I don't think we want to admit it is widely available, and under the FDA it is illegal to sell in head shops and Natural Health stores, as it hasn't been approved as a Natural Health Product.

Let me know if you are OK with saying:

Products that claim to contain *S. divinorum* or its main active ingredient, salvinin A are widely available on the Internet and may be sold ~~are sold~~ in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Hi Cathy,

It's been a long (and windy) road, but finally we have the salvia products below for your approval. They have been signed off at the DG level in HPFB by the NHPD, the Inspectorate and Marketed Health Products. MO would like the NR issued on February 18th, so hopefully you'll be able to review and approve before your upcoming leave.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

**Comment [S1]:** Q From Cathy - Should this info. be in the media lines - as a Q&A? Stephanie - have added this line to the Media lines background

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

Deleted:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

**Comment [S2]:** Our media lines are more definitive - i.e. Canadians SHOULD NOT USE salvia - plse. continue this strong messaging in the IYH.  
NOTE from Cathy - "Shouldn't we say 'do not consume'?" is the best way to reduce risk?

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "**Need More Info?**" section below for links to resources that can help you with this.

Deleted: avoid using

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

Products that claim to contain *S. divinorum* or its main active ingredient, salvinorin A are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

**Comment [S3]:** Is it typical in IYH articles to provide information on where substances are available, where they can be bought? Could providing this information prompt some to go looking?  
NOTE from Cathy: "do we say this in IYHs?"

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada published a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*, on February 19, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

**Deleted:** issued

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be regulated under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011. ([www.gazette.gc.ca](http://www.gazette.gc.ca))

**Key Messages:**

- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to regulate both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of these substances.
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act will make possession, trafficking, importation, exportation, and production (or cultivation) illegal unless authorized by regulation.

Deleted: ir

Deleted: CDSA

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently regulated under the CDSA. At the present time, products containing *Salvia divinorum* that indicate its hallucinogenic properties would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient

**DRAFT**  
01/02/2011

salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

### Questions and Answers:

#### **Q1 – What is involved in regulating *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act (CDSA)* is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of regulating a substance under the CDSA is the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

The regulation of these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

#### **Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A2 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

2011-02-09

**DRAFT**  
01/02/2011

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why is it not controlled under the Controlled Drugs and Substances Act?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A,

**Please confirm -- Has HPFB approved this reply and this link -- is it correct? The Approved By: listing on page 5 indicates HPFB approvals are pending, with the exception of Robin Marles in NHPD.**

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come)

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

**Comment [S1]:** Copied and pasted this line from the IYH article. Please see notes in the article about this.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

# News Release

## The Government of Canada Proposes to Regulate *Salvia Divinorum* and Salvinorin A as Controlled Substances

February 17, 2011

For immediate release

Deleted: 18

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health announced that the Government of Canada intends to regulate *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 19, 2011

Deleted: also known as Salvia,

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body," added Aglukkaq.

The Notice to Interested Parties will propose that *Salvia divinorum* and its main active ingredient salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, importation, exportation, and production (or cultivation) will be illegal unless authorized by regulation. Regulating *Salvia divinorum* and salvinorin A as a controlled substance will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Christine,

Only to clarify that your statement about where salvia can be sold is not quite right. It is not illegal under the FDA to sell salvia in head shops or natural health stores because there are no approved products, it is illegal to sell in those establishments when it is specifically sold as a hallucinogen, which is when the definition of an NHP comes into play, and the requirement for authorization under the FDA kicks in. Technically, someone selling salvia as a herbal incense product in a natural health store would not be doing anything illegal.

01/02/2011

Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why is it not controlled under the Controlled Drugs and Substances Act?**

A4 – The move to regulate *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)* when marketed as a hallucinogen. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Please confirm -- Has HPFB approved this reply and this link -- is it correct? The Approved By: listing on page 5 indicates HPFB approvals are pending, with the exception of Robin Marles in NHPD. All three DGs in HPFB have signed off: Diana Dowthwaite, DG, HPFB, Sharon Mullin, Director, Compliance and Enforcement Coordination, HPFB, Robin Marles, Director, Bureau of Clinical Trials, NHPD**

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come)

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

**DRAFT**

01/02/2011

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

**Comment [S1]:** Q From Cathy - Should this info. be in the media lines - as a Q&A? Stephanie - have added this line to the Media lines background

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

**Comment [CR2]:** Not necessary - we will be providing a link to the FYH article from the media lines and NR.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to regulate both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because very little is known about the effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "*Need More Info?*" section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations* when marketed as a hallucinogen. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently regulated under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada published a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*, on February 19, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

## Need More Info?

- For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:  
Consumers: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)  
Trade: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_38\\_trade-industrie\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_38_trade-industrie_cp-pc-eng.php). Or contact the **Health Products and Food Branch Inspectorate** directly by calling toll-free 1-800-267-9675.

- You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:  
Report online at the MedEffect™ Canada website at: <http://www.hc-sc.gc.ca/dhp-mps/medeff/index-eng.php>  
Call toll-free at 1-866-234-2345  
Complete a Canada Vigilance Reporting Form and either:  
Fax toll-free to 1-866-678-6789  
Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9  
To have postage pre-paid, download the postage paid label from the MedEffect™ Canada website. DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short and long-term in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

Subject:          Re: Salvia Retailers

Hi Lisa Marie,

Yes these are the sort of stores we are interested in, but because it would be impossible to find the names of all the stores in Canada (and it might be perceived as unfair to contact some and not others), we were hoping to find a central association or group which many would belong to. But I have a feeling such an association doesn't exist... If you can't find any, I'll talk to Denis and see what he thinks about targeting specific shops like the ones you listed below.

Hi Denis,

I have one comment with regards to the NOI. It has been revised to state that "effects are reported to be short and **long-term** in nature". According to the IAS (which both ODARS and HPFB have reviewed), there has only been one reported case of *deja-vu* after using Salvia which could possibly be considered a long-term effect. Besides that we have no other info about long-term effects, so I don't think its strictly true to suggests that there are long-term effects given the available scientific info. We also state in the MLs and IYH that very little is known about its long-term effects. It was also never our intention to have HPFB review the NOI, so I suggest we leave the NOI as is.

Besides that, the NR, MLs and IYH look fine to me.

Stephanie

2011-02-03 05:16 PM

Hi Jocelyn,

Further to my previous email, Stephanie has pointed out to me that the signed version of the NOI contains the version of the PRAD email account address with the underscores. Given that both versions of the PRAD address function, I suggest we stick with the underscore version for the purposes of the NOI.

Also, for the list of stakeholders, Stephanie clarified for me that we never did receive any names/suggestions from HPFB. Apparently, they are unable to extract info their database(s) in manner where they could simply give us contacts interested in salvia! As a result, once the NOI goes out, they will send a message to this effect themselves through their database.

Hi Jocelyn,

For the PRAD email account, while the old format with the underscores still seems to function, the address also functions with the underscores replaced by periods. For the sake of consistency, we will use the period format.

We will explore asap whether there are any associations for natural food stores or alternative lifestyle shops that could be added to the list of stakeholders.

two comments:

do we not need to update the PRAD email address to have ".s in it rather than "\_s in it?

for the list of stakeholders, what about looking for an association of natural health food stores (I doubt there is an association for head shops), or an association for alternative life style stores.....just that retailers are who are most likely to be impacted....

Hi Jocelyn,

For publication on February 19, we need to have the package delivered to *Canada Gazette* by noon on Friday, February 11. While the copies of the NOI that Cathy signed are dated January 28, these probably don't need to be re-signed (to be confirmed with Stephanie) as it is the covering letter to *Canada Gazette* that indicates the date on which we want the NOI published.

Unlike the NOI, the covering letter would be signed by yourself and can thus be easily amended here in OCS to reflect the new target date of February 19.

As for the list of stakeholders, Stephanie submitted to me a final list of stakeholders which I approved with a few minor modifications. The actual message we would send up is approved and ready to go.

I will work with Carmen to set-up a bilat.

Jocelyn - I read through the comments and don't think Cathy needs to approve again - 

Once HPFB sorts through this seemingly unanswerable question, then we can provide Cathy with a copy of the revised docs as an fyi only. I don't see that Chantale's suggested changes are controversial and if you agree with them pls let me know if you want me to make the changes or Stephanie C. I will send the comments below to my comms colleague in HPFB and ask her to follow up with her client.

I hope the end is in sight on this soon. I feel we have been going in circles on the NHP issue too long.

Christine

As requested incorporated the specific changes..

Here are the general comments:

- Dates of posting NOI need to be confirmed and made consistent through out all documents.

---

For DIR approval,

I have review the documents and Collin's comments and approve.

General Comment

- Dates to posting NOI need to be confirmed and made consistent through out all documents.

IYH Article

- Statement under "Minimizing your Risk"of "Just because a drug is plant-based or "natural", does not mean that it is safe." needs to be run by NHPD as not sure this is consistent with they wording.."
- Statement of Legal Status need to confirm date with NHPD.
- Under the sentence about compliance actions should mention NHPRs in addition to FDA.
- Under "Need More Info" - complaints about unauthorised sale cannot be "made" to the link. That link goes to consumer complaints doc. Wording should say something like "information on how to submit a complaint about the unauthorized sale of ....can be found at: [link](#)"

NOI Document

- In paragraph 2 may want to explicitly say "short and long term" for the health risks?

ML

- Propose the first Supplemental message be reworded to :  
The plant *Salvia divinorum* is not currently regulated under the CDSA despite being a hallucinogen. Currently products containing *Salvia divinorum* that indicate its halocogenic properties would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* .
- I also agree with Collin and Dina that using the word illegal in Q4 is misleading..

NR

- I agree with Collin for consistency sake.

Subject: Re: Fw: FOR APPROVAL: Salvia NR, MLs, NOI and IYH article

---

**Draft NOI - looks fine**

**MLs** - agree with suggested wording in first comment under "Key Messages". Maybe it's getting late but the first bullet under "supplementary messages" seems confusing. Also, I do not like the wording at the end of question 4 - "...why isn't it illegal" - this was my comment from last week. Fact is, it is a contravention to sell if unauthorised (i.e. no NPN) and no salvia product has ever been issued an NPN. Not sure why we are saying "why isn't it illegal" in the question when all salvia products essentially are.

**Salvia News Release** - see second last para - minor but may want to include "(or cultivation)" next to production as this is how it is written in the draft NOI. Otherwise looks fine.

**IYH Article** - will need to confirm dates for official NOI align with one another in all of these documents: IYH says Feb 5 and NR says Feb 12. Also, under "Need More Info" - complaints about unauthorized sale cannot be "made" to the link. That link goes to consumer complaints doc. Wording should say something like "information on how to submit a complaint about the unauthorized sale of ....can be found at: [link](#)"

Hi Suzanne - can you please see the comments below from Sherrey Collier, Legal Counsel for HPFB on the inconsistency in the way we refer to the effects of Salvia in these documents. Can you please let me know how you would like to revise the documents so we are being consistent in our messaging about the effects of Salvia. The package has already been approved by Cathy, and the three DGs in HPFB, so we will provide a copy to her again as an FYI only. Jocelyn's group is making the required changes to the NOI and will have Cathy re-approve this document. The NHPD has approved the deletion of the hallucinogenic phrase below in Sherrey's email. thx.

great!

Denis/ Stephanie- I think we still have to change the NOI, and I assume that means Cathy will have to resign. That means another docket, which we will need to get Arafo to rush as today is her last day. Please add note to docket explaining why she needs to sign again.

JK

Hi Jocelyn,

We have revised the Salvia NOI according to the recommendations from legal. Denis has requested that I send these tracked versions to you for review prior to us sending it up to DO in a docket.

No need for docs to be re-approved. Comms consultation with OCS and NHPD were that changes did not require re-approval but will go back through as an FYI only. My understanding from Christine is that this means we are still on track for Feb 19, but perhaps Stephanie C can double-check.

DRAFT Salvia NOI\_Feb 4 EN\_clean.wpd

---

Hi Christine,

This is the revised NOI that Cathy has just signed. We have not included the suggested reference by HPFB to include "short and long-term effects" and we have changed "The regulation of Salvia" to "The scheduling of Salvia" in the fifth paragraph. We have also revised the OCS email for consistency, however I don't believe any of the comms products include our email.

DGO would also like to confirm that it is not necessary for Cathy to re-approve any of the comms products and that we are still on track as far as comms is concerned for publication on Feb 19. Could you please confirm?

Thanks,

Stephanie

Just got this. I see that some changes are required, but am not sure at this point if they have to go back through Cathy or not. Perhaps you can read through and let me know what you think....

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The scheduling of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDas). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDas.

Des rapports ont récemment été publiés indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, avec un taux de consommation plus important (7,3%) parmi les jeunes âgés de 15 à 24 ans. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au Canada montrent également que 5 % des jeunes de 15 ans ont consommé de la *S. divinorum* au cours de la dernière année. De plus, le *Sondage sur la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no<sup>o</sup>10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La mise en annexe de la *S. divinorum* et de la salvinorine A sous la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

Suzanne

Only to echo what Stephanie just said, the NOI below has the wording that you recommended in it, and hence that is why we went ahead and got Cathy to resign. To be clear, the only reason we had to get her to resign was because Legal advised that we should use the word "schedule" or "control" rather than "regulate" because at this point, we are not recommending including Salvia in a schedule to any of the regulations.

Hi Suzanne,

As far as the NOI is concerned we have stuck with the original wording from the version you reviewed and we incorporated the two changes you had suggested. Please note that Cathy has already approved the version attached below for your information.

[attachment "DRAFT Salvia NOI\_Feb 4 EN\_clean.wpd" deleted by Suzanne Desjardins/HC-SC/GC/CA]

I think there may be some confusion regarding a previous version that HPFB commented on, so feel free

to call me if you have any questions/concerns.

Hi Christine,

**s.19(1)**

The reason we did not include the "long-term effects" statement in the NOI was to keep it consistent with the MLs and IYH as pointed out by Sherrey in Legal:

When talking about the known effects of salvia, the documents are somewhat inconsistent. For example, in the *Notice to Interested Parties*, it says "known effects are reported to be short and long-term in nature"; the Medial Lines under Key Messages, News Release and IYH say "little is known about the long-term effects of these substances on the brain and body"; and finally, in the background: "These effects are short-acting in nature..."

Throughout the analysis of Salvia there has been little information with regard to the long-term effects and I believe that the current IYH and MLs reflect this (as does the final NOI). Suzanne also reviewed the NOI in January when it had the wording "While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature..." which is what we have kept for the final version. Therefore I don't believe that the comms products need to be revised in this particular regard.

I have cc'ed Suzanne so that she may provide any comments she might have.

Stephanie

Hi Christine,

This is the revised NOI that Cathy has just signed. We have not included the suggested reference by HPFB to include "short and long-term effects" and we have changed "The regulation of Salvia" to "The scheduling of Salvia" in the fifth paragraph. We have also revised the OCS email for consistency, however I don't believe any of the comms products include our email.

[attachment "DRAFT Salvia NOI\_Feb 4 EN\_clean.wpd" deleted by Christine Roush/HC-SC/GC/CA]

DGO would also like to confirm that it is not necessary for Cathy to re-approve any of the comms products and that we are still on track as far as comms is concerned for publication on Feb 19. Could you please confirm?

Thanks,

Stephanie

History: This message has been replied to.

Hi All - I revised all the documents based on comments from HPFB & HECS Legal services, and your revised NOI. As a quick signal check to ensure consistency throughout all documents in how we refer to the known effects (short and long-term), I have highlighted in yellow the references to these in all docs. Could you please take a quick look and let me know by 1:00 pm today if all are OK with the revisions, before seeking HECS and HPFB ADMO approvals. thx.

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

---

<sup>1</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The scheduling of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

# News Release

## The Government of Canada Proposes to Schedule *Salvia Divinorum* and Salvinorin A as Controlled Substances

Deleted: Regulate

February 17, 2011  
For immediate release

OTTAWA – Today, the Honourable Leona Aglukkaq, Minister of Health announced the Government of Canada's proposed intention to include *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal will be published in *Canada Gazette*, Part I, on February 19, 2011

Deleted: that

Deleted: ds to regulate

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the potentially harmful effects of this substance," said Minister Aglukkaq. "The use of this substance is of concern to Health Canada as very little is known about its long-term effects on the brain and body."

Formatted: Highlight

The Notice to Interested Parties will propose that *Salvia divinorum* and its main active ingredient salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation) will be illegal unless authorized by regulation. The scheduling of *Salvia divinorum* and salvinorin A as a controlled substance will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Deleted: importation, exportation, and production (or cultivation)

Deleted: Regulating

***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011.

Deleted: regulated

**Key Messages:**

- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of these substances.
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* will make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

Deleted: regulate

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

Deleted: regulating

**A1 -** Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

Deleted: regulation

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against the aforementioned factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I. Any comments received will be considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses.

Deleted: regulating

Controlling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Deleted: The

Deleted: regulation of

**Q2 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

**A2 -** Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

**DRAFT**

07/02/2011

Deleted: 1

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q3 – Is there any research on the use of *Salvia divinorum* in Canada?**

A3 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q4 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why is it not controlled under the Controlled Drugs and Substances Act?**

A4 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

Deleted: regulate

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

Deleted: when marketed as a hallucinogen

Formatted: Highlight

**Q5 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A5 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A,

**Q6 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A6 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also issued a news release on February 17<sup>th</sup> announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011, giving interested parties a 30-day period to submit their comments.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and

**DRAFT**

07/02/2011

Deleted: 1

- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## Salvia divinorum

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

**Comment [S1]:** Q From Cathy - Should this info. be in the media lines – as a Q&A? Stephanie – have added this line to the Media lines background

Certain websites promote the use of *S. divinorum* as a “legal” alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

**Comment [CR2]:** Not necessary – we will be providing a link to the IYH article from the media lines and NR.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

**Formatted:** Highlight

In light of this information, Health Canada is proposing to schedule both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

**Deleted:** regulate

**Deleted:** a

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because very little is known about the long-term effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Formatted: Highlight

Formatted: Highlight

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "*Need More Info?*" section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Deleted: when marketed as a hallucinogen

Formatted: Highlight

While *S. divinorum* and salvinorin A are not currently scheduled under the *Controlled Drugs and Substances Act* (CDSA), Health Canada is now developing a regulatory proposal that would add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

Deleted: regulated

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to schedule *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada published a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*, on February 19, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.

Deleted: regulate

## Need More Info?

- For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:  
Consumers: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)

Hi All - I revised all the documents based on comments from HPFB & HECS Legal services, and your revised NOI. As a quick signal check to ensure consistency throughout all documents in how we refer to the known effects (short and long-term), I have highlighted in yellow the references to these in all docs. Could you please take a quick look and let me know by 1:00 pm today if all are OK with the revisions, before seeking HECS and HPFB ADMO approvals. thx.

Hi Christine,

Well I can't say I am surprised about the event, although I really can't understand the logic here given that it will only bring more pressure on us to get through the regulatory process as fast as we can.....which is exactly what I now understand MO is asking for per your conversation with Stephanie C this afternoon. And not sure exactly what to tell you other than what we have already said in the NOI package, i.e, we will have a package intended for pre-publication in CG I ready for departmental approvals in May 2011. I am not able to commit how long it will take DMO and MO to review our package (and I suspect they will not commit to a timeline) and hence, we just can't be any more specific than that. Typically, the reg process documents in HC say that program areas should allow 4-8 weeks for ministerial concurrence, which would take us to the end of June 2011.....I just don't want to be held to that, in case there are shifts in priorities in the meantime, etc. Obviously, we would like to get through TB before the house rises for the Summer but honestly, it is not I or anyone else in CSTD who will decide that.

Re. partners, I think RCMP or possibly CBSA would be more important than DOJ as they are the ones who see Salvia coming into the country/ on the street.

Happy to discuss, and sorry for being so late to reply. I left the office

Hi Jocelyn,

Dave just got off the weekly call with MO Comms and they want a Salvia event next Wednesday, February 16th. The documents are currently in HECS-ADMO for Hillary's approval - though Jesse has just asked if we could shorten the IYH article. Dave is looking at it now and I will let you know what edits are done to it. There will be a planning meeting held soon. HPFB has fully approved the documents - Paul Glover signed off this morning on them. We will likely receive a request to prepare a Ministerial Event Proposal, which I will draft - and a speech, which our Ministerial Services unit will draft with assistance from your group. Not sure whether there would be any partner depts involved, though it would make sense to have Justice or

RCMP there too. More to come, I'm sure.

Thx Jocelyn - I'll ensure these changes are made. So to be clear, you are Ok with saying that the regulatory process could take 18 to 24 months to complete? I thought I understood from your email last night that it could be considerably shorter?

Jocelyn Kula

**Subject:** Re: Revised Qs&As re: Timing for Regulatory Process

Hi Christine,

For Q2, the Q should read "Why has the Gov't now decided to schedule these substances under the CDSA?" (in order to be consistent with wording elsewhere and in the NOI/ IYH)

I personally also think that the word "control" is vague unless you say "control as controlled substances"

(which is repetitive)

For Q3, all good. Per previous message to Stephanie, I do not think we should try and change the language to read "illegal" etc.

Lastly, for Q1, there is a mistake that is quite important to fix. In the edited text, you refer to Schedule II, when it should read Schedule III (Schedule II is for cannabis only).

JK

**DRAFT**  
07/02/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011.

**Key Messages:**

- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of these substances.
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act will make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA. At the present time, products containing *Salvia divinorum* would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized

DRAFT  
07/02/2011

natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

Questions and Answers:

Q1 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?

A1 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette, Part I*, which will be published on February 19, 2011 for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule II to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

Q2. Why has the Government now decided to control these substances?

A2. Controlling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

DRAFT  
07/02/2011

**Q3 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

Deleted: 1  
1

Deleted: 2

Deleted: 2

A3 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented laws restricting their use, sale and/or distribution.

**Q4 – Is there any research on the use of *Salvia divinorum* in Canada?**

Deleted: 3

A4 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Deleted: 3

**Q5 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why is it not controlled under the Controlled Drugs and Substances Act?**

Deleted: 4

A5 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

Deleted: 4

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

DRAFT  
07/02/2011

**Q6 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

Deleted: 5

**A6 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.**

Deleted: 5

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Q7 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

Deleted: ¶

Deleted: 6

**A7 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also issued a news release on February 17<sup>th</sup> announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011, giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.**

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

**Data from the 2008-2009 Youth Smoking Survey indicates that:**

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;

Deleted: The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. ¶

- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

## Salvia divinorum - It's Your Health Article

Deleted:

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to schedule both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)

- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### **Minimizing Your Risk**

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because little is known about the long-term effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the "***Need More Info?***" section below for links to resources that can help you with this.

### **Legal Status of *Salvia divinorum***

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently scheduled under the *Controlled Drugs and Substances Act* (CDSA), Health Canada has issued a Notice to Interested Parties which proposes to add *S. divinorum* and salvinorin A to Schedule III to the CDSA.

**Deleted:** is now developing a regulatory proposal that would

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Need More Info?

- For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:  
Consumers: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)

Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C

### Deleted: Health Canada's Role¶

¶ In light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to schedule *S. divinorum* and salvinorin A as controlled substances. As a first step in this process, Health Canada published a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*, on February 19, 2011. In the interim, Health Canada will continue to monitor the sale of unauthorized health products that contain *S. divinorum* or its main active ingredient salvinorin A. It will take appropriate action should it become aware of any unauthorized health products that may pose a risk to Canadians.¶

I am enclosing the most relevant of the bunch you sent me; personally, the more we show actual labelling  
indicating is sold as incense, but then suggesting how to use, the better. The original 2nd pic you  
suggested with the baggies with spades on them is rather meaningless to me, as it could be anything.

Same goes for the vial and leaf extract.....I don't think we have any others but am copying Stephanie Chandler in case she knows.....

Subject: Re: ADMO Q re: Salvia

Sorry for the delay.

1. In general, the impact of our proposing to regulate salvia as a controlled substance in Canada will result in the same activities being illegal here as are illegal in other countries where they have taken similar action. That said, it does depend on the country. In Australian and Japan for instance, it is illegal to import and/or sell Salvia. In the US however, some states have gone so far as to impose an age limit on sale and use, i.e., the product cannot be sold to anyone under the age of 18 etc.

2. Yes and no. While the offences are the same for marihuana (Schedule II) and what they will be for Salvia (Schedule III), some of the applicable penalties are different, e.g., a possession offence for marihuana will incur varying penalties depending on the amount (this is the whole impact of Sch VII and Sch VIII to the CDSA) while a possession offence for a Schedule III substance is liable to imprisonment up to 3 years. For illegal production, the penalty for marihuana is imprisonment up to 7 years but only up to 3 years for a substance in Schedule III. (this sounds confusion I know but this is the CDSA- perhaps we should think about doing a general overview on the Act with Hilary, or at least

providing her with the info sheets we have.....)

Subject: Re: Fw: ADMO Q re: Salvia

I spoke with Hilary about this again this morning. What she is really  
getting at is will Canada's scheduling be in line with what other  
countries are doing? e.g. in those other countries/states we mention, are  
possession, trafficking, import/export, and production illegal?

She doesn't want a country by country or offence by offence comparison,  
but wants to understand if the things we're making illegal are illegal in  
other places.

Also, she would like to know if this will put similar controls as we have  
on marihuana?

Thanks,

Jesse

Hi Jesse,  
Please see Jocelyn's reply below.  
Illegal activities with a given controlled substance constitutes different  
things in different countries (even state to state as in the US)  
contingent on the legislation of the country/state.

Have a look at Jocelyn's reply and let us know if this does the trick or  
if you want more specifics, which folks can pull from the IAS if need be.

Thanks, S

Subject: Re: ADMO Q re: Salvia

A central principle of our legislative framework for controlled substances  
is that a substance is never "illegal", only activities, e.g., sale,  
importation, cultivation, possession, etc., with a given substance can be  
illegal depending on what Schedule it is in. This mirrors the way the UN  
drug control conventions are set up. In other countries, depending on  
the legislation in place, the activities that are illegal will differ from  
country to country, or in the US, where there are no national controls in  
place, from state to state.

Our IAS on Salvia has more specific information in it, and Stephanie C can  
provide if needed. I would not suggest however that we try to clarify the  
IYH, it will only lead to more confusion...the wording we use here is  
consistent with the media lines, and all of our previous dockets etc.....

Hi Jocelyn,

The BZP NOI was published under the authority of "Section 55 (1)(a) and Section 60 of the CDSA". I will revise the Salvia NOI insertion form to reflect this.

Hi Jocelyn,

With regards to the authority of the CDSA under which the Salvia NOI will be published, Section 60 of the Act states:

The Governor in Council may, by order,

amend any of Schedules I to VIII by adding to them or deleting from them any item or portion of an item, where the Governor in Council deems the amendment to be necessary in the public interest

Please advise as to whether we should include this Section on the NOI insertion form as opposed to Section 55?

Thanks,

Stephanie

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia is being used - and abused - by some young people.

It has been getting more popular because it's currently not an illegal substance, but it can have some of the same effects as illegal drugs.

Deleted: 's

It's also popular among youth because it's easily available and because of the perception that it doesn't do any harm.

Deleted: 's

Deleted: been getting

Deleted: The fact is that we don't know what kind of harm it can cause.¶

Deleted: as if it were a drug

We are still learning about Salvia, but we do know that when it is used, it is most commonly smoked. And we know that smoking Salvia can produce hallucinations.

Those two facts alone tells us that is has potential to cause damage to the body or the brain....or both.

Deleted: enormous

If it's producing hallucinations, then it is interfering with the normal functions of the brain. When you are young, your brain is going through an important period of development. Anything that interferes with that development could have serious, long-term consequences.

Comment [S1]: To my knowledge, there is no evidence it affects development.

Deleted: ¶

Because of the way it is being used and because of its potential for abuse, we believe this substance needs to be controlled. This will reduce the potential risks to the health and safety of Canadians from its ready availability, its increased use and its unknown effects if used long-term.

Deleted: it

Deleted: regulated

Deleted: their

Deleted: their

Deleted: their

Deleted: have

Deleted: become

That's why we will be moving to control Salvia and its main active ingredient, "Salvinorin A", as controlled substances.

Deleted:

Deleted: add

Deleted: m

Deleted: to the list of drugs

As a first step, a notice will be published in the *Canada Gazette* in a few days. This will give Canadians an opportunity to comment on our proposal to include these substances under Schedule III to the Controlled Drugs and Substances Act.

Deleted: of

Deleted: That's the same law that makes it illegal to possess or sell common street drugs.¶

Making Salvia a controlled substance will make activities such as possession, trafficking, importing or cultivating salvia illegal.

Deleted: it

Deleted: ould

Deleted: Salvia

This will make it much harder to get Salvia, and it also sends the message to young Canadians that they should not be taking this substance. It will also allow law enforcement agencies to take action against illegal activities involving this substance.

Deleted: at  
Deleted: ould  
Deleted: ill  
Deleted: but  
Deleted: ould

Legislation is an important step in controlling the availability and use of Salvia, but our most important task is to get the message to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information on our website about Salvia and the risks of using it. We want to eliminate the misconception that Salvia is safe compared to illegal drugs.

Deleted: ¶  
Deleted: If it's producing hallucinations, then it is interfering with the normal functions of the brain. When you are young, your brain is going through an important period of development. Anything that interferes with that development could have serious long-term consequences.¶  
¶

Any non-prescription substance that interferes with the normal functions of a person's brain should not be taken by anyone at anytime.

Deleted: Using I  
Deleted: to our website

Though all of the dangers of Salvia are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way and suffer for the rest of their lives.

Comment [S2]: Will the IYH have been posted prior to event?

Deleted: have

Comment [S3]: I would suggest deleting... seems a bit too forceful, and what about OTCs and NHPs that affect the brain?

Deleted: It is not safe.

Deleted: A

Deleted: they

Formatted: Highlight

Deleted: are

Formatted: Not Highlight

Comment [S4]: No evidence of long-term effects at this point, so do we want to say this?

Thank you.

Hi Jocelyn,

Stephanie and I have made a number of edits and suggestions.

That being said, there are several fairly definitive statements about the health effects of salvia that should be reviewed by Suzanne's group as we may want to clarify and/or tone down some of these statements.

¶

Making Salvia a controlled substance will make activities such as possession, trafficking, importing or cultivating illegal.

Deleted: it

Deleted: ould

Deleted: Salvia

This will make it much harder to get Salvia, and it also sends the message to young Canadians that they should not be taking this substance. It will also allow law enforcement agencies to take action against illegal activities involving this substance.

Legislation is an important step in controlling the availability and use of Salvia, but our most important task is to get the message to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information on our website about Salvia and the risks of using it. We want to eliminate the misconception that Salvia is safe compared to illegal drugs.

Any non-prescription substance that interferes with the normal functions of a person's brain should not be taken by anyone at anytime.

Though all of the dangers of Salvia are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way and suffer for the rest of their lives.

Thank you.

---

Hi Jocelyn,  
In case MO would like to revisit the idea of a Salvia event sometime soon, we have proceeded with the  
drafting of a speech for the Minister. I have reviewed the speech and my changes are in red. Could you  
please do the same and return your comments to me **by Friday, Feb 11 at 10:00 am.**

Thanks,

Hi Dave, Tim is checking if they want a Salvia news release next week (now that there mostly likely won't be an event). Tim also said that program can still proceed with going to CG1 for Feb 19th.

**DRAFT**  
11/02/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011 (TBC).

**Key Messages:**

- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A.
- After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- Health Canada is continuing to survey the prevalence of salvia use and have based our proposed scheduling on available information and reports that suggest these substances have the potential for abuse, especially among young Canadians. The risks of salvia use include hallucinations, loss of consciousness and short-term memory loss.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient

**DRAFT**  
11/02/2011

salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 - What are the risks associated with the use of *Salvia divinorum***

A1 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

**Q2 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

**DRAFT**

11/02/2011

A2 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which will be published on February 19, 2011 (TBC) for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q3. Why has the Government now decided to schedule these substances under the CDSA?**

A3. Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q4 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A4 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

**DRAFT**  
11/02/2011

Some individual U.S. states have implemented similar laws restricting their use, sale and/or distribution.

**Q5 – Is there any research on the use of *Salvia divinorum* in Canada?**

A5 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q6 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

A6 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q7 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A7 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**DRAFT**

11/02/2011

**Q8 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A8 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also issued a news release on February XX announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011 (TBC), giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Subject: Fw: For review - Minister's Speech - Salvia

Hi Suzanne,

Would it be possible for you to review the Minister's Speech for the (potential) Salvia NOI event? There are several fairly definitive statements about the health effects of Salvia, so your input would be appreciated.

[attachment "Sp-Min-Salvia-v3(revcr)\_Feb10\_15h43.doc" deleted by Suzanne Desjardins/HC-SC/GC/CA]

My apologies for the short-turn around time, but Comms would like it back from OCS by 10:00am tomorrow, so if you could review ASAP it would be much appreciated.

Thanks,

Stephanie

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia divinorum is being abused - by some young people.

It has been getting more popular because it's currently not an illegal substance, but it can have some of the same effects as certain illegal drugs.

It's also popular among youth because it's easily available and because of the false perception that it doesn't do any harm.

We are still learning about Salvia, but we do know that when it is used, it is most commonly smoked. And we know that smoking Salvia can produce hallucinations.

While we are still learning about Salvia divinorum, we know that when it is used, it is most commonly smoked and that smoking Salvia can produce hallucinations.

Those two facts alone tells us that it has the potential to harm health, cause damage to the body or the brain... or both.

If it's producing hallucinations, then it is interfering with the normal functions of the brain. When you are young, your brain is going through an important period of development. Anything that interferes with that development could have serious, long-term consequences.

Therefore, because of the way it is being used, and its potential for abuse and harm to health we will be moving to control Salvia divinorum and its main active ingredient, "Salvinorin A", as controlled substances to reduce the known and potential risks to the health and safety of Canadians. Because of the way it is being used and because of its potential for abuse, we believe this substance needs to be controlled. This will reduce the potential risks to the health and safety of Canadians from its ready availability, its increased use and its unknown effects if used long-term.

That's why we will be moving to control Salvia divinorum and its main active ingredient, "Salvinorin A", as controlled substances.

**Comment [HABR1]:** Should we not be specifying that we are talking about Salvia divinorum in particular? There are many species of Salvia.

**Comment [S2]:** This substance is only being used for its psychoactive effects, therefore it is abused

**Deleted:** used - and

**Deleted:** 's

**Comment [HABR3]:** I think we should be more precise, even if we're being vague: "some of the same effects as CERTAIN illegal drugs."

**Deleted:** have

**Deleted:** become

As a first step, a notice will be published in the *Canada Gazette* in a few days. This will give Canadians an opportunity to comment on our proposal to include these substances under Schedule III to the *Controlled Drugs and Substances Act*.

Making *Salvia divinorum* (and "Salvinorin A") a controlled substances will make activities such as possession, trafficking, importing or cultivating illegal.

This will make it much harder to get *Salvia*, and it will also send the message to young Canadians that they should not be taking this substance. It will also allow law enforcement agencies to take action against illegal activities involving these substances.

Legislation is an important step in controlling the availability and use of *Salvia divinorum*, but our most important task is to get the message to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information on our website about *Salvia* and the risks of using it. We want to eliminate the misconception that *Salvia* is safe compared to illegal drugs.

Any substance that interferes with the normal functions of a person's brain should not be taken by anyone at anytime, unless it is prescribed by a physician for the treatment of a disease.

Though all of the dangers of *Salvia* are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way and suffer for the rest of their lives.

Thank you.

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia divinorum is being abused by some young people.

*Its use has been increasing in popularity*  
It has been getting more popular because it's currently not a controlled substance, but it can have some of the same effects as certain illegal drugs. *even though it*

It's also popular among youth because it's easily available and because of the false perception that it doesn't do any harm. *become* *illicit drugs*  
*↳ that it is safer than other drugs*

While we are still learning about Salvia divinorum, we know that when it is used, it is most commonly smoked and that smoking Salvia can produce hallucinations.

Those two facts alone tells us that is has the potential to harm health.

Therefore, because of the way it is being used, and its potential for abuse and harm to health, we will be moving to control Salvia *like illicit drug* divinorum, and its main active ingredient salvinorin A, as controlled substances to reduce the known and potential risks to the health and safety of Canadians, particularly youth.

As a first step, a notice will be published in the *Canada Gazette* in a few days. This will give Canadians an opportunity to comment on our proposal to include these substances under Schedule III to the *Controlled Drugs and Substances Act*.

Making Salvia divinorum (and salvinorin A) controlled substances will make activities such as possession, trafficking, importing or cultivating illegal.

This will make it much harder to get Salvia, and will also send the message to young Canadians that they should not be using this substance. It will also allow law enforcement agencies to take action against illegal activities involving these substances.

**Comment [HABR1]:** Should we not be specifying that we are talking about Salvia divinorum in particular? There are many species of Salvia.

**Comment [S2]:** This substance is only being used for its psychoactive effects, therefore it is abused

**Comment [HABR3]:** I think we should be more precise, even if we're being vague: "some of the same effects as CERTAIN illegal drugs."

**Comment [HABR4]:** "because of the FALSE perception that it doesn't do any harm"

Legislation is an important step in controlling the availability and use of Salvia divinorum, but our most important task is to get the message to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information ~~on our website~~ about Salvia and the risks of using it. We want to eliminate the misconception that Salvia is safe compared to ~~legal~~ drugs.

on our website.

other illicit

Comment [S5]: Will the IYH have been posted prior to event?

Though all of the dangers of Salvia are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way.

Thank you.

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia divinorum is being abused - by some young people.

It has been getting more popular because it's currently not an illegal substance, but it can have some of the same effects as certain illegal drugs.

It's also popular among youth because it's easily available and because of the false perception that it doesn't do any harm.

We are still learning about Salvia, but we do know that when it is used, it is most commonly smoked. And we know that smoking Salvia can produce hallucinations.

While we are still learning about Salvia divinorum, we know that when it is used, it is most commonly smoked and that smoking Salvia can produce hallucinations.

Those two facts alone tells us that it has the potential to harm health, cause damage to the body or the brain... or both.

If it's producing hallucinations, then it is interfering with the normal functions of the brain. When you are young, your brain is going through an important period of development. Anything that interferes with that development could have serious, long-term consequences.

Therefore, because of the way it is being used, and its potential for abuse and harm to health we will be moving to control Salvia divinorum and its main active ingredient, "Salvinorin A", as controlled substances to reduce the known and potential risks to the health and safety of Canadians. Because of the way it is being used and because of its potential for abuse, we believe this substance needs to be controlled. This will reduce the potential risks to the health and safety of Canadians from its ready availability, its increased use and its unknown effects if used long-term.

That's why we will be moving to control Salvia divinorum and its main active ingredient, "Salvinorin A", as controlled substances.

Subject: Re: Fw: For review - Minister's Speech - Salvia

---

Hi Suzanne,

I have made some additional changes to the document (please see attached word document).

Clean versions of these paragraphs (and explanations) below:

I have modified the original paragraphs 2 and 3 to yield (I think it makes more sense this way):  
"Its use has been increasing in popularity, even though it can have some of the same effects as certain illicit drugs. It has also become popular among youth because it is not currently a controlled substance, it's easily available, and because of the false perception that it is safer than illicit drugs."

Last paragraph has been eliminated and merged to the second to last paragraph to yield (also the word "out" in bold has been added):

"Legislation is an important step in controlling the availability and use of Salvia divinorum, but our most important task is to get the message **out** to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information about Salvia and the risks of using it on our website. We want to eliminate the misconception that Salvia is safe compared to other illicit drugs and we don't want young people to find out the hard way."

Thanks,  
Hanan

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia divinorum is being abused by some young people.

~~Its use has been increasing in popularity because it's currently not a controlled substance, even though it can have some of the same effects as certain illicit drugs.~~

Its use has been increasing in popularity, even though it can have some of the same effects as certain illicit drugs. It has also become popular among youth because it is not currently a controlled substance, it's easily available, and because of the false perception that it is safer than illicit drugs.

~~It has also become popular among youth because it's easily available and because of the false perception that it is safer than illicit drugs.~~

While we are still learning about Salvia divinorum, we know that when it is used, it is most commonly smoked and that smoking Salvia can produce hallucinations.

Those two facts alone tells us that is has the potential to harm health.

Therefore, because of the way it is being used, and its potential for abuse and harm to health, we will be moving to control Salvia divinorum, and its main active ingredient salvinorin A, like other illicit drugs in order to reduce the known and potential risks to the health and safety of Canadians, particularly youth.

As a first step, a notice will be published in the *Canada Gazette* in a few days. This will give Canadians an opportunity to comment on our proposal to include these substances in Schedule III to the *Controlled Drugs and Substances Act*.

Making Salvia divinorum (and salvinorin A) controlled substances will make activities such as possession, trafficking, importing or cultivating illegal.

**Comment [HABR1]:** Should we not be specifying that we are talking about Salvia divinorum in particular? There are many species of Salvia.

**Comment [S2]:** This substance is only being used for its psychoactive effects, therefore it is abused

**Deleted:** "S..."...it...a-... [17]

This will make it much harder to get Salvia, and will also send the message to young Canadians that they should not be using this substance. It will also allow law enforcement agencies to take action against illegal activities involving these substances.

Legislation is an important step in controlling the availability and use of Salvia divinorum, but our most important task is to get the message out to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information about Salvia and the risks of using it on our website. We want to eliminate the misconception that Salvia is safe compared to other illicit drugs, and we don't want young people to find out the hard way.

~~Though all of the dangers of Salvia are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way.~~

Thank you.

Hi Christine,

Sorry but Hanan just caught one error in the version I last sent you. In the last paragraph, the word "other" should be removed so as not to give the impression that Salvia is an illicit drug. I have fixed in the version attached below:

Hi Christine,

I think saying "even though" is referring to the potential negative effects of illicit drugs, but I see what you mean. I don't think we should use "because" as that isn't necessarily the reason that Salvia is increasing in popularity. What about if we said just said "and"?

Its use has been increasing in popularity, and it can have some of the same effects as certain illicit drugs.

Hi Stephanie - I have a question about a revision that Hanan made to the speech. Should we not say below  
**"because"** it can have some of the same effects as certain illicit drugs, instead of "even though"? I thought Salvia had become popular because people discovered it wasn't illegal and it had some of the same effects as illicit drugs?

Its use has been increasing in popularity, even though it can have some of the same effects as certain illicit drugs.

Christine,

I think we have to be careful that we don't end up back with the old old content re the four "red herring" adverse event reports etc. that got HPFB all twisted around back in 2007-08, and since the Qs in these media lines come from us, I would like to suggest that we rephrase the question to make it easier for us to answer, i.e.,

**Q5 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

Then we could stick with the existing answer.

Suzanne- any thoughts?

---

Hi Suzanne,

The Salvia package is with our DG, Comms for approval, but they have requested that we include a response (or sentence- maybe as part of Q5) on whether we are aware of any Adverse Reactions caused by Salvia use. Could you please provide a line or two on this by noon today and return to me so I can continue with approvals.

Thanks.

**Q5 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum* , why is it not controlled under the Controlled Drugs and Substances Act?**

A5 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS), *Youth Smoking Survey* (YSS) and the *Ontario Student Drug Use and Health Survey* (OSDUHS), some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR) . The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

Hi All - I revised all the documents based on comments from HPFB & HECS Legal services, and your revised NOI. As a quick signal check to ensure consistency throughout all documents in how we refer to the known effects (short and long-term), I have highlighted in yellow the references to these in all docs. Could you please take a quick look and let me know by 1:00 pm today if all are OK with the revisions, before seeking HECS and HPFB ADMO approvals. thx.

Hi Christine,

This is the revised NOI that Cathy has just signed. We have not included the suggested reference by HPFB to include "short and long-term effects" and we have changed "The regulation of Salvia" to "The

scheduling of Salvia" in the fifth paragraph. We have also revised the OCS email for consistency, however I don't believe any of the comms products include our email.

[attachment "DRAFT Salvia NOI\_Feb 4 EN\_clean.wpd" deleted by Christine Roush/HC-SC/GC/CA]

DGO would also like to confirm that it is not necessary for Cathy to re-approve any of the comms products and that we are still on track as far as comms is concerned for publication on Feb 19. Could you please confirm?

Thanks,

Stephanie

Hi Denis,

As you are aware, due to my absence on Monday, Feb 14th, you have been listed as the person Canada Gazette should contact to confirm receipt of the Salvia NOI and to confirm the publication date. If by noon on Monday you have not received a call confirming the NOI, please contact Canada Gazette at 613-996-1268.

I am in training all day Monday and Tuesday, but if you need to get in touch with me, you can contact me on my cell at 

Thanks,

Good Morning/Afternoon: Thank you for being here.

A substance known as Salvia divinorum is being abused by some young people.

**Comment [HABR1]:** Should we not be specifying that we are talking about Salvia divinorum in particular? There are many species of Salvia.

**Comment [S2]:** This substance is only being used for its psychoactive effects, therefore it is abused

Its use has been increasing in popularity because it's currently not a controlled substance, even though it can have some of the same effects as certain illicit drugs.

**Deleted:** used - and

**Deleted:** -

**Deleted:** 's

It has also become popular among youth because it's easily available and because of the false perception that it is safer than illicit drugs.

**Deleted:** getting more...n...illegal...but ... [1]

**Comment [HABR3]:** I think we should be more precise, even if we're being vague: "some of the same effects as CERTAIN illegal drugs."

While we are still learning about Salvia divinorum, we know that when it is used, it is most commonly smoked and that smoking Salvia can produce hallucinations.

**Deleted:** 's...been gettir... [2]

**Comment [HABR4]:** "because of the FALSE perception th... [3]

Those two facts alone tells us that is has the potential to harm health.

**Comment [HABR5]:** U... [4]

**Deleted:** that it doesn't (... [5]

Therefore, because of the way it is being used, and its potential for abuse and harm to health, we will be moving to control Salvia divinorum, and its main active ingredient salvinorin A, like other illicit drugs in order to reduce the known and potential risks to the health and safety of Canadians, particularly youth.

**Deleted:** The fact is that... [6]

**Deleted:** We are still lea... [7]

**Formatted** ... [8]

As a first step, a notice will be published in the *Canada Gazette* in a few days. This will give Canadians an opportunity to comment on our proposal to include these substances in Schedule III to the *Controlled Drugs and Substances Act*.

**Deleted:** ill

**Deleted:** but...taking ... [19]

**Deleted:** is

**Deleted:** ¶

Legislation is an important step in controlling the availability and use of Salvia divinorum, but our most important task is to get the message to young people that this substance is dangerous. That is why we are taking these steps now and why we have posted information about Salvia and the risks of using it on our website. We want to eliminate the misconception that Salvia is safe compared to other illicit drugs.

Though all of the dangers of Salvia are not known, we do know from our own review of information that it is not safe. And we don't want young people to find out the hard way.

Thank you.

**Deleted:** If it's producing hallucinations, then it is interfering with the normal functions of the brain. When you are young, your brain is going through an important period of development. Anything that interferes with that development could have serious long-term consequences. ¶

**Deleted:** Using I

**Deleted:** to our website

**Comment [S8]:** Will the IYH have been posted prior to event?

**Deleted:** have

**Deleted:** illegal

**Comment [S9]:** Agreed that this para should be deleted; it is too hard to explain in a sentence and would confuse the message i.e. it is OK to interfere with brain functions if you are sick, but not if you are healthy??? What about alcohol??? It does interfere with the brain functions

**Comment [S10]:** I would suggest deleting... seems a bit too forceful, and what about OTCs and NHPs that affect the brain?

**Deleted:** ¶  
Any

**Deleted:** non-prescription

**Deleted:** substance that interferes with the normal functions of a person's brain should not be taken by anyone at anytime, unless it is prescribed by a physician for the treatment of a disease.

**Deleted:** ¶

**Deleted:** It is not safe.

**Deleted:** A

**Deleted:** they

**Deleted:** are

**Formatted:** Not Highlight

**Comment [S11]:** No evidence of long-term effects at this point, so do we want to say this?

**Comment [S12]:** Agreed that we should delete this part as we don't know long-term effects.

**Deleted:** and suffer for the rest of their lives.

Dear Ms. Boisvert:

**Re: Notice to Interested Parties - Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).**

Please find enclosed, in both official languages, the following documents:

- two hard copies of a Notice to Interested Parties regarding these substances;
- electronic copies of the notice, with English and French versions in two separate files; and
- a signed and completed "Request for Insertion" form.

We ask that the notice be published in *Canada Gazette*, Part I, on February 19, 2011. The departmental contact for this notice is Denis Arseneault, who can be reached at 613-957-6828.

Yours sincerely,

Jocelyn Kula  
A/Director  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate

Hi all, Cailin just confirmed that we will be doing an event for Salvia on wednesday.

It will not be our minister making the announcement. She will be up north.

Dave - can you start a MEP? I can work with someone from your team to pull it together.

The event will take place in BC building or the press gallery tbc

Jocelyn/Suzanne,

Can I please get your final approval of the Salvia speech below by 11:30 today. Seems like the event is happening this Wednesday. Further details to follow, as we get them.

Hi Christine,

I think saying "even though" is referring to the potential negative effects of illicit drugs, but I see what you mean. I don't think we should use "because" as that isn't necessarily the reason that Salvia is increasing in popularity. What about if we said just said "and"?

Its use has been increasing in popularity, and it can have some of the same effects as certain illicit drugs.

Subject:	Re: REVISED- Minister's Speech - Salvia	

Hi Stephanie - I have a question about a revision that Hanan made to the speech. Should we not say below

"because" it can have some of the same effects as certain illicit drugs, instead of "even though"? I thought Salvia had become popular because people discovered it wasn't illegal and it had some of the same effects as illicit drugs?

Its use has been increasing in popularity, even though it can have some of the same effects as certain illicit drugs.

Good Morning/Afternoon: Thank you for being here.

Among today's generation of our youth, a substance known as Salvia has been gaining popularity and is being abused by some young people.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs. It's easily available, and there is a false perception that it is safe.

Deleted: and the

But it isn't safe.

Deleted: I

We are still learning about Salvia, but we know that when it is used, it is most commonly smoked, and smoking it can produce hallucinations.

Deleted: but at this early stage there is evidence that it could cause long-term damage to the body and the brain. ¶  
¶  
W

Those two facts alone tells us that it has the potential to harm health.

Deleted: it

Deleted: when it is smoked

Because of the way it is being used, and its potential for abuse, we are proposing to add Salvia divinorum, and its main active ingredient salvinorin A, to the Controlled Drugs and Substances Act.

Deleted: And at the moment it is not a controlled substance and it's easily available. ¶  
¶

Deleted: will be moving to control S

We believe these substances should be controlled, just like other illicit drugs, because of their potential risks to the health and safety of Canadians, particularly our young people.

Deleted: .

Deleted: Salvia

As a first step to controlling these substances, a notice will be published in the *Canada Gazette* in a few days. That will start a process during which Canadians will have an opportunity to comment on our proposal.

Deleted: We are proposing Salvia be added to the *Controlled Drugs and Substances Act*.

Making it a controlled substance will make activities such as possessing, trafficking, importing or cultivating Salvia illegal.

That will make Salvia harder to get and send the message to young Canadians that they should not be using it. It will also allow law

Deleted:

enforcement agencies to take action against illegal activities involving these substances.

Legislation is an important step in controlling the availability and use of Salvia divinorum, but our most important task is to get the message out to young people that Salvia is dangerous.

That is why we are taking these steps now and why we have posted information about Salvia and the risks of using it on our website.

We want to eliminate the misconception that Salvia is safe compared to illicit drugs and we don't want young people to find out the hard way.

**Deleted:** For anyone who would like to know more, we have posted

Thank you.

Good Morning/Afternoon: Thank you for being here.

Among today's youth, a substance known as Salvia has been gaining popularity and is being abused by some young people.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations.

It presents potential risks to the health and safety of Canadians, particularly our young people.

That is why we are proposing to add Salvia divinorum, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step to controlling these substances, a notice will be published in the *Canada Gazette* in a few days. That will start a process during which Canadians will have an opportunity to comment on our proposal.

Legislation is an important step in controlling the availability and use of Salvia divinorum and salvinorin A.

It will make activities with these substances, such as possession, trafficking, importing or cultivating illegal.

It sends a clear message that these substances are dangerous, and that they are illegal in Canada.

---

Good afternoon Robin,

██████████ called. It seems that he quit smoking, and was trying to find "herbal cigarettes." He went to a store that sold "\$400 bongos" and asked for herbal cigarettes to help him quit the habit. The 16 yr old who served him told him that she could not find the herbal cigarettes, and suggested he smoke salvia instead....

He just wanted to call HC to tell us that this is potent stuff and that it is a hallucinogenic. He is not outraged that this happened to him, he's actually laughing about it, but he wanted to warn HC since he says a 12 year old could probably purchase it, which should be of concern to HC.

He did not want to make a complaint, but I thought you might want to know.

Hello all,

As I'm sure most of you know the IYH article on Salvia will be going live soon. We are still waiting on a final date and time for posting but I wanted to have everything on the servers ready to go live when we get confirmation on the date and time. I have asked that the article also be linked to the web pages below but I wondered if any of you wanted to link it to some of your content pages as well?

For example

Learn about drugs at -

<http://www.nationalantidrugstrategy.gc.ca/parents/drugs-drogues/drugs-drogues.html>

Natural Health Products - <http://www.hc-sc.gc.ca/dhp-mps/prodnatur/index-eng.php>

etc.....please let me know if you would like it linked to any of your sections.

Here is the English and French that will be going on-line

IYH Salvia divinorum Final Eng HTML 15Feb2011.doc IYH Salvia divinorum Fr Final HTML 15Feb2011.doc

## It's Your Health

### Salvia divinorum

#### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Scientific reports also suggest that it has the potential for abuse.

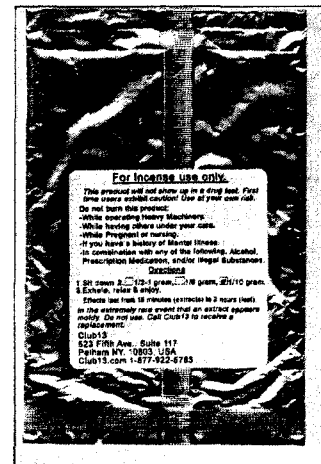

Canadians should not use products containing *S. divinorum* and/or salvininorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to schedule both *S. divinorum* and its main active ingredient salvininorin A under Schedule III to the Controlled Drugs and Substances Act (CDSA) in order to protect the health and safety of Canadians, particularly youth.

#### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

### Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because little is known about the long-term effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or “natural”, does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs, such as marijuana, cocaine, ecstasy, LSD and other substances that distort reality. See the “*Need More Info?*” section below for links to resources that can help you with this.

### Legal Status of *Salvia divinorum*

#### In Canada

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the Natural Health Products Regulations. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the Food and Drugs Act.

While *S. divinorum* and salvinorin A are not currently scheduled under the Controlled Drugs and Substances Act (CDSA), Health Canada has issued a Notice to Interested Parties which proposes to include *S. divinorum* and salvinorin A as controlled substances to the CDSA. This means that activities such as possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting would be illegal unless authorized by regulation.

### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed similar controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the Controlled Substances Act, but a number of individual states have placed similar restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

### **Background**

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades

7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the ***Need More Info*** section below.

### **Health Canada's Role**

As noted above, in light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, Health Canada is taking steps to regulate *S. divinorum* and salvinorin A as controlled substances.

## Need More Info?

For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:

- [How to Submit a Consumer Complaint](#)
- [How to Submit a Trade Complaint](#)

Or contact the Health Products and Food Branch Inspectorate directly by calling toll-free 1-800-267-9675.

To report an adverse reaction or interaction involving any health product, contact Health Canada at 1-866-234-2345 (toll free in Canada), or visit the [MedEffect Canada](#) web section

For information about the Government of Canada's [National Anti-Drug Strategy](#) The Prevention section on this site has a number of helpful resources for parents, including:

- [Tips on Talking to Your Teenager](#)
- [What to Do if Your Teen is Using Drugs](#)
- Health Canada's [Not4Me](#) youth drug prevention section

Information on natural health products and the [Natural Health Products Regulations](#)

For more on the surveys that have collected information about *Salvia divinorum* use in Canada, see:

- [The 2008-2009 Youth Smoking Survey](#)
- [The 2009 Canadian Alcohol and Drug Use Monitoring Survey](#)
- [The 2009 Ontario Student Drug Use and Health Survey](#)

## Votre santé et vous

### Salvia

#### Enjeu

La salvia est une espèce de sauge de la famille des labiacées qui a plusieurs noms : Maria pastora, ska Maria pastora, ska pastora, sauge divinatoire, sauge des devins, menthe magique, herbe de la bergère, herbe de Marie, herbe de la Vierge, Sally D et Lady Sally.

Certains sites Web encouragent la consommation de salvia comme substitut *légal* aux drogues de la rue. De récentes données canadiennes de surveillance montrent que les adolescents et les jeunes adultes canadiens consomment de la salvia pour ses propriétés hallucinogènes. Des rapports scientifiques semblent indiquer qu'il y a risque d'abus.

Les Canadiens doivent éviter de consommer de produits contenant de la salvia, car il s'agit d'une substance hallucinogène dont on connaît mal les effets à long terme sur le cerveau et l'organisme. Votre réaction peut être différente chaque fois que vous en consommez.

À la lumière de ces renseignements, Santé Canada propose d'inscrire la salvia et son principal ingrédient actif, la salvinorine A, à l'annexe III de la Loi réglementant certaines drogues et autres substances afin de protéger la santé et la sécurité des Canadiens, surtout les jeunes.

#### Risques associés à la consommation de salvia

La salvia a des effets physiques et mentaux connus qui varient d'une personne à l'autre, qui sont souvent qualifiés de désagréables et qui peuvent comprendre les suivants :

- hallucinations
- dysphorie (sentiment d'angoisse, de dépression ou d'agitation)
- expériences extracorporelles
- rire incontrôlable
- évanouissement
- perte de mémoire immédiate
- manque de coordination des mouvements
- trouble de l'élocution et phrases maladroites

Il est impossible de prédire quels effets cette substance aura sur vous. De plus, les effets peuvent varier d'une fois à l'autre en fonction de divers facteurs, dont les suivants :

- la puissance du produit
- la quantité consommée
- la pureté du produit (les produits contenant de la salvia peuvent être mélangés à d'autres substances)

- le mode de consommation (si le produit est chiqué, avalé ou fumé)
- l'humeur et les attentes de l'utilisateur

Bien que les scientifiques sachent sur quels récepteurs du cerveau agit le principal ingrédient actif, la salvinine A, on connaît mal :

- les effets globaux de cette substance sur le cerveau, notamment si elle entraîne des effets à long terme ou si elle peut causer des lésions cérébrales permanentes
- la façon dont elle interagit avec d'autres substances, comme d'autres drogues, des produits de santé naturels et l'alcool
- le risque de dépendance physique ou de toxicomanie associé à la consommation de la salvia

### **Réduire les risques**

Les hallucinogènes comme la salvia altèrent les fonctions cérébrales. Santé Canada recommande d'éviter de consommer de la salvia, car ses effets à long terme sur les fonctions organiques et cérébrales sont peu connus. De plus, votre réaction peut être différente chaque fois que vous en consommez. Une drogue n'est pas forcément sûre simplement parce qu'elle est *naturelle* ou fabriquée à partir de plantes.

Par ailleurs, si vous avez des enfants, discutez avec eux de la pression du groupe et des risques liés à la consommation de drogues, comme la marijuana, la cocaïne, l'ecstasy, le LSD et autres substances psychotropes. Dans la section ***Pour en savoir plus*** ci-dessous vous trouverez des liens vers des ressources qui peuvent vous aider à vous préparer en vue d'une telle discussion.

### **Statut juridique de la salvia**

#### Au Canada

Comme la salvia est une plante aux propriétés hallucinogènes lorsqu'elle est consommée par des humains, elle est assimilable à un produit de santé naturel selon la définition qu'en donne le Règlement sur les produits de santé naturels. En février 2011, Santé Canada n'avait toujours pas homologué de produit de santé naturel contenant de la salvia. Conformément à la Loi sur les aliments et drogues, Santé Canada peut prendre des mesures coercitives à l'égard de quiconque vend des produits de santé naturels non homologués contenant de la salvia ou son principal ingrédient actif, la salvinine A.

Si la salvia et la salvinine A ne sont pas, à l'heure actuelle, considérées comme des substances contrôlées en vertu de la Loi réglementant certaines drogues et autres substances, Santé Canada a toutefois émis un avis aux parties intéressées dans lequel il propose de les ajouter à l'annexe III de la *Loi*.

#### À l'étranger

Plusieurs pays, notamment l'Australie, la Belgique, l'Allemagne, l'Italie et le Japon, réglementent l'importation et la vente de la salvia et de la salvinine A.

Aux États-Unis, la salvia et la salvinorine A ne sont pas réglementées en vertu de la *Loi sur les substances contrôlées*, mais certains États ont adopté des mesures visant à en restreindre la vente et l'importation. Par exemple, plusieurs États interdisent, à divers degrés, la fabrication, la distribution, l'importation, l'exportation, la possession, la consommation, l'achat et la vente de la salvia et de la salvinorine A, tandis que d'autres en limitent la distribution. Dans certains États, il est illégal de vendre de la salvia à une personne de moins de 18 ans.

### **Contexte**

Les Mazatèques font un usage traditionnel des feuilles de cette plante lors de rites divinatoires ou curatifs.

Les produits se vendent sous plusieurs formes, notamment en feuilles fraîches ou séchées, en liquides ou en graines et en boutures pour la culture.

L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues révèle qu'en 2009, 1,6 % des Canadiens ont déclaré avoir consommé de la salvia au moins une fois et que la consommation est beaucoup plus élevée (7,3 %) chez les jeunes de 15 à 24 ans. L'Enquête canadienne 2008-2009 sur le tabagisme chez les jeunes montre que 5 % des jeunes de 15 ans avaient consommé de la salvia au cours de l'année précédente. Selon le Sondage 2009 sur la consommation de drogues et la santé des étudiants de l'Ontario, 5,4 % des étudiants ontariens de la 7<sup>e</sup> à la 12<sup>e</sup> année ont déclaré avoir déjà consommé de la salvia, et 4,4 % d'entre eux ont affirmé en avoir consommée au cours de l'année précédente. Pour obtenir de plus amples renseignements sur ces enquêtes, veuillez consulter la section *Pour en savoir plus* ci-dessous.

### **Rôle de Santé Canada**

À la lumière des risques pour la santé et la sécurité associés à la consommation de salvia, surtout chez les jeunes, Santé Canada prend des dispositions pour ajouter cette substance et la salvinorine A à la liste des substances contrôlées.

### **Pour en savoir plus**

Pour savoir comment présenter une plainte concernant la vente non autorisée de produits de santé contenant de la salvia, veuillez consulter le document pertinent ci-dessous :

- Plaintes de consommateur
- Plaintes de l'industrie

ou communiquer directement avec l'Inspectorat de la Direction générale des produits de santé et des aliments, en composant sans frais le 1-800-267-9675.

Pour signaler un effet indésirable ou une interaction mettant en cause un produit de santé, communiquez avec Santé Canada, au 1-866-234-2345 (sans frais au Canada), ou consultez la section MedEffet Canada

Pour vous renseigner sur la Stratégie nationale antidrogue du gouvernement du Canada. Vous y trouverez, dans la section Prévention, plusieurs ressources à l'intention des parents, dont les suivantes :

- Conseils pour aborder le sujet des drogues avec son adolescent
- Que faire si votre adolescent consomme de la drogue
- Site Web de Santé Canada, Section 0droguepourmoi sur la prévention de la toxicomanie

Vous trouverez des renseignements sur les produits de santé naturels et le Règlement sur les produits de santé naturels

Pour en savoir plus sur les enquêtes sur la consommation de salvia au Canada, consultez :

- L'Enquête 2008-2009 sur le tabagisme chez les jeunes
- L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues 2009
- L'Enquête 2009 sur la consommation de drogues et la santé des étudiants de l'Ontario (en anglais seulement)

I am enclosing the most relevant of the bunch you sent me; personally, the more we show actual labelling indicating is sold as incense, but then suggesting how to use, the better. The original 2nd pic you suggested with the baggies with spades on them is rather meaningless to me, as it could be anything. Same goes for the vial and leaf extract.....I don't think we have any others but am copying Stephanie Chandler in case she knows.....

Subject: Fw: Salvia event confirmed for wednesday

---

Lisa - just learned this morning that the event is happening this Wednesday - see details below, as we currently know it. Apparently there is a planning meeting today at 3:30. Any chance of having the IYH article posted on Wednesday??

Beth - you will be receiving a speech shortly for HPFB's urgent review by 3pm today. thx.

Thanks all,

This point had been raised as well with respect to the draft speech - which previously lacked any reference to existing regulations, which could imply that no regulations would presently apply.

I think the solution for the interim (until it becomes scheduled) may be to emphasize that there are current regulations that would apply (NHPR), but that NO products have been approved under these regulations (nor would they) - but drop references to salvia products 'meeting the definition of a natural health product', since I believe that this is the part that leads to confusion.

Words to this effect are included in the revised attached speech.

Please advise if this works for everyone.

Thanks,  
Beth

Hi Lisa

I agree with Jocelyn and Robin.

We do not want to add to the already existing confusion of the consumer and their parents....

The more clarity we give to this issue, the better..making Health Canada look 'proactive'.

Thanks

Thank you, Jocelyn. You raise a good point. Classifying Salvia divinorum as an NHP when used as a hallucinogen is a stop-gap measure until the amendment to CDSA has been passed. We all agree that CDSA is the most appropriate regulatory framework for this substance. Therefore, I don't think we don't want to continue drawing the public's attention to a linkage with the NHP world after the new regulatory proposal has been announced.

Hi Lisa

I don't want to speak for my colleagues in NHPD but am not sure we want to continue drawing strings between salvia and other natural health products that have been approved and are actually being sold legitimately as NHPs?? Happy to defer to whatever HPFB thinks is best though.....

The reference to NADS and parents talking to youth is fine.

Hello all,

As I'm sure most of you know the IYH article on Salvia will be going live soon. We are still waiting on a final date and time for posting but I wanted to have everything on the servers ready to go live when we get confirmation on the date and time. I have asked that the article also be linked to the web pages below but I wondered if any of you wanted to link it to some of your content pages as well?

For example

Learn about drugs at -

<http://www.nationalantidrugstrategy.gc.ca/parents/drugs-drogues/drugs-drogues.html>

Natural Health Products - <http://www.hc-sc.gc.ca/dhp-mps/prodnatur/index-eng.php>

etc.....please let me know if you would like it linked to any of your sections.

Here is the English and French that will be going on-line

Check Against Delivery

Good Morning/Afternoon: Thank you for being here.

Among today's youth, a substance known as Salvia has been gaining popularity and is being abused by some young people.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations as well as other serious effects on the brain and body. In addition, very little is known about the long-term effects of these substances.

It presents potential risks to the health and safety of Canadians, particularly our young people.

That is why we are proposing to add Salvia divinorum, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step to controlling these substances, a notice will be published in the *Canada Gazette* in a few days. That will start a process during which Canadians will have an opportunity to comment on our proposal.

Legislation is an important step in further controlling the availability and use of Salvia divinorum and salvinorin A.

It would make activities with these substances, such as possession, trafficking, importing or cultivating illegal.

Deleted: It will

It would send a clear message that these substances are dangerous, and that they are illegal in Canada.

Deleted: s

It would also allow law enforcement agencies to take action against illegal activities involving these substances.

Deleted: ill

Deleted: ill

Deleted: and legal

Deleted: it's

Deleted: either

Most importantly, it would protect our young people from the harms associated with Salvia.

Deleted: meet the definition of a natural health product under

Hi Jocelyn - can you see question below in email about date by which you will accept comments on the NOI. Is this date still correct? As well, see comment in MLs from the Director of Comms in Min office. I'll need answers to these Qs by tomorrow latest. Thx

Alexis M Tervo

**Subject:** For tomorrow morning - Salvia products

Hi Christine, a couple questions for you on the Salvia products.

For the news release:

-Can we confirm if interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 14, 2011? In the news release, we still have this marked by TBC.

For the media lines (see comments/revisions in attached).

HECS\_ML\_Salvia\_Feb11\_1327.doc

**DRAFT**  
11/02/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011 (TBC).

**Key Messages:**

- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of these substances.
- Canadians should not use products containing *Salvia divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.
- After reviewing available information and reports that suggest this substance has the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

**Comment [h1]:** Tim doesn't like this message. He would like a message on what the risk is. I understand from Dave that it is still unknown. Can we add something about the fact that we are assessing the risk?

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA. ~~At the present time, products containing *Salvia divinorum* would meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations*.~~
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient

**Formatted:** Strikethrough

**DRAFT**  
11/02/2011

salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

A1 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which will be published on February 19, 2011 (TBC) for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q2. Why has the Government now decided to schedule these substances under the CDSA?**

A2. Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**DRAFT**  
11/02/2011

**Q3 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A3 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented similar laws restricting their use, sale and/or distribution.

**Q4 – Is there any research on the use of *Salvia divinorum* in Canada?**

A4 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q5 - What are the risks associated with the use of *Salvia divinorum***

A5 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

**DRAFT**

11/02/2011

- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

**Q6 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

A6 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS), *Youth Smoking Survey* (YSS) and the *Ontario Student Drug Use and Health Survey* (OSDUHS), some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q7 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A7 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

**DRAFT**  
11/02/2011

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Q8 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A8 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also issued a news release on February XX announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011 (TBC), giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

**DRAFT**

11/02/2011

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Subject: Re: Fw: CSS-WG Stakeholders for Salvia NOI

Hi Lisa,

The *Salvia divinorum* Notice to Interested Parties (NOI) has been submitted to Canada Gazette and it will most likely be published this coming Saturday, February 19th.

The Office of Controlled Substances (OCS) has prepared an email which we will be distributing to our stakeholders, likely on the morning of Monday, February 21st. I have attached these proposed emails below, and it would be appreciated if NHPD could also distribute them to its stakeholders. If you would like to revise these emails to suit the needs of NHPD, OCS would appreciate if you could share with us the final version of what you will be sending before it is distributed.

[attachment "Stakeholder notification of NOI Feb 16 2011 FR.wpd" deleted by Lisa M Young/HC-SC/GC/CA] [attachment "Stakeholder notification of NOI Feb 16 2011 EN.wpd" deleted by Lisa M Young/HC-SC/GC/CA]

Please also note that as we have not yet received final confirmation of the publication, **please do not send out this email until you have received confirmation from myself.** At this time, I will also provide you with the appropriate website links.

Please let me know if you have any questions or concerns.

Regards,

Stephanie

October 21, 2010

**Re: Update on the Assessment of Naturally-Sourced Medicinal Ingredients found on Schedule F**

Dear Stakeholders,

In March 2009 Health Canada announced that it would be undertaking the scientific assessment of a number of naturally-sourced substances currently listed in Schedule F to the *Food and Drug Regulations*. The purpose of this initiative was to determine which of these substances should remain unchanged, be modified, or removed entirely from the Schedule. Health Canada followed up this announcement with an update in December 2009

(  
[http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/notice-avis\\_schedulef\\_annexef-dec2009-eng.php](http://www.hc-sc.gc.ca/dhp-mps/prodnatur/legislation/docs/notice-avis_schedulef_annexef-dec2009-eng.php)).

This message is to provide *an update on* this initiative:

**1) Four (4) medicinal ingredients proposed for removal from Schedule F: apiol oil, centella asiatica extract and active principles thereof, deanol and its salts and derivatives, and theobromine and its salts.**

Targeting consideration by Treasury Board Ministers for final publication in the *Canada Gazette*, Part II in January/February 2011.

**2) Six (6) medicinal ingredients proposed to remain on Schedule F with qualifiers: dopamine and its salts, gold and its salts, uracil and its salts, dimethyl sulfoxide, levocarnitine, and l-tryptophan.**

Prescription status for specific strengths, uses, routes of administration or dosages.

Targeting consideration by Treasury Board Ministers for final publication in the *Canada Gazette*, Part II in February/March 2011.

**3) Lovastatin**

Moving forward as its own regulatory package.

Health Canada is reviewing comments received further to the Notice of Intent and undertaking further

internal analysis.

Further updates will be provided when appropriate.

Respectfully,

The Natural Health Products Directorate  
Health Canada

Hi Sara,

The Notice of Intent is published in the Canada Gazette, but we will send a letter to stakeholders indicating that the NOI has been published and include a link to the document. In this Office the majority of our stakeholders will be contacted by email unless we don't have an email on file for them. While email is the preferred method of contact, if this option isn't available we could mail or fax.

Let me know if you have any other questions.

Stephanie

DRAFT  
11/02/2011

**Media Lines**  
**Salvia divinorum**

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011 (TBC).

**Key Messages:**

- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A.
- Canadians should not use products containing these substances because of the risks associated with their use, which may include hallucinations, loss of consciousness and short-term memory loss. As well, little is known about the long-term effects of these substances on the brain and body.
- Therefore, after reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* and its associated regulations.

DRAFT  
11/02/2011

**Q1 - What are the risks associated with the use of *Salvia divinorum***

A1 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Formatted: Bullets and Numbering

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

Formatted: Bullets and Numbering

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

Formatted: Bullets and Numbering

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

**Q2 - What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

Formatted: English (U.S.)

Deleted: ¶

Deleted: ¶

A2 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

Deleted: ¶

- Overall risk to public health and safety posed by the substance.

DRAFT  
11/02/2011

- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which will be published on February 19, 2011 (TBC) for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q3. Why has the Government now decided to schedule these substances under the CDSA?**

Deleted: 2

**A3.** Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Deleted: 2

**Q4 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

Deleted: ¶  
¶  
¶  
¶

**A4 -** Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

Deleted: 3

Deleted: 3

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have implemented similar laws restricting their use, sale and/or distribution.

DRAFT  
11/02/2011

**Q5 – Is there any research on the use of *Salvia divinorum* in Canada?**

**A5** - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q6 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

**A6** – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q7 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

**A7** – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**Q8 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

**A8** - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also

**DRAFT**

11/02/2011

issued a news release on February XX announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011 (TBC), giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Hi Christine,

Jocelyn and Denis are in a meeting until 12 so I don't think she will be responding to you by 11:30...

As the updated key messages include specific references to potential risks, I am cc'ing Suzanne Desjardins in case she has any comments on the revised media lines.

In response to your earlier question, comments on the NOI should be submitted by March 21, 2011.

Regards,

Stephanie

[REDACTED]

Dear [REDACTED]

Thank you for your correspondence of December 14, 2010; concerning the legal status of *Salvia divinorum*.

After reviewing available information and reports that suggest that *Salvia divinorum* has the potential for abuse, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011, giving interested parties a 30-day period to submit their comments.

The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of these substances. In the meantime, Health Canada is cautioning Canadians against the use of products containing *Salvia divinorum* and/or salvinorin A because these products are reportedly hallucinogenic and little is known about the long-term effects of these substances on the brain and body. ~~The limited information available suggests there is also no way to predict how it will affect you with each use. Health Canada does not recommend the use of products containing *Salvia divinorum* and salvinorin A because very little is known about these substances, their potential effects on the brain and body, and their impact on physical and mental functions.~~

This paragraph reflects what legal has recommended we revise the 14H to say

~~The plant *Salvia divinorum* is not regulated under the *Controlled Drugs and Substances Act* and, therefore, is not considered to be banned, nor are activities associated with it illegal in Canada. Health Canada is currently collecting and studying information about *Salvia divinorum* and is assessing whether regulating *Salvia divinorum* and salvinorin A~~

is warranted.

~~When specifically marketed for its hallucinogenic properties, Salvia divinorum meets the definition of a natural health product (NHP) under the Natural Health Products Regulations. However, Health Canada has not authorized any NHPs containing Salvia divinorum as an ingredient for sale. The sale of unauthorized NHPs containing Salvia divinorum or its active ingredient, salvinorin A, may be subject to compliance and enforcement action by the Department under the Food and Drugs Act.~~

Thank you for writing.

Sincerely,

Leona Aglukkaq

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

Notice to interested parties — Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

The plant *S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15–24 years. The results from the Canadian 2008–2009 *Youth Smoking Survey* also show that 5% of 15-year-olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7–12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations drug control conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

<sup>1</sup> Dennehy C. E., Tsourounis C., Miller A. E. "Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use." *Annals of Pharmacotherapy* 39, 10 (October 2005):1634–9.

MINISTÈRE DE LA SANTÉ

LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

Avis aux parties intéressées — Proposition concernant l'ajout de *Salvia divinorum* et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDAS). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

La plante *S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extracorporelles, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDAS.

Des rapports ont récemment été publiés indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. La *S. divinorum* est largement vantée comme un hallucinogène « légal » sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme solution de rechange aux drogues illicites<sup>1</sup>. Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, avec un taux de consommation plus important (7,3 %) parmi les jeunes âgés de 15 à 24 ans. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au Canada montrent également que 5 % des jeunes de 15 ans ont consommé de la *S. divinorum* au cours de la dernière année. De plus, le *Sondage sur la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDAS, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en œuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

<sup>1</sup> Dennehy C. E., C. Tsourounis et A. E. Miller. « Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use ». *Annals of Pharmacotherapy*, vol. 39, n° 10 (octobre 2005), p. 1634-1639.

Including these substances within Schedule III to the CDSA would prohibit possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The scheduling of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater Street, Ottawa, Ontario, Canada K1A 1B9, by fax at 613-946-4224 or by email at OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca.

## DEPARTMENT OF HEALTH

### FOOD AND DRUGS ACT

#### Food and Drug Regulations — Amendments

#### Interim Marketing Authorization

The addition of nutrients to foods sold in Canada is regulated under the *Food and Drug Regulations* (the Regulations). The current regulatory provisions list the types of foods that can be fortified, which nutrients can be added and the levels permitted in the particular food. Provision currently exists in the Regulations for the addition of vitamin D to products such as skim milk, partly skimmed milk, margarine and liquid whole eggs.

Health Canada has received a submission to permit the optional addition of vitamin D2-yeast to yeast-leavened bakery products at a level of 90 I.U. (2.25 µg) per 100 g. Health Canada has completed the safety assessment of the proposal to fortify yeast-leavened bread and unstandardized yeast-leavened bakery products such as pizza crust, bread mix, donuts, croissants and bagels. Evaluation of available data has demonstrated that the addition of vitamin D to the foods described above at a level of up to 90 I.U. (2.25 µg) per 100 g of product, as consumed, is safe. The evaluation also concluded that the source of vitamin D need not be limited to a yeast source.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La mise en annexe de la *S. divinorum* et de la salvinorine A sous la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler, Division de la politique réglementaire, Bureau des substances contrôlées, Indice de l'adresse 3503D, 123, rue Slater, Ottawa (Ontario), Canada K1A 1B9, par télécopieur au 613-946-4224 ou par courriel au OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca.

Le 4 février 2011

La directrice générale  
Direction des substances contrôlées et  
de la lutte au tabagisme  
CATHY A. SABISTON

## MINISTÈRE DE LA SANTÉ

### LOI SUR LES ALIMENTS ET DROGUES

#### Règlement sur les aliments et drogues — Modifications

#### Autorisation de mise en marché provisoire

L'ajout de nutriments aux aliments vendus au Canada est régi en vertu du *Règlement sur les aliments et drogues* (le Règlement). Les dispositions réglementaires actuelles énumèrent les types d'aliments pouvant être enrichis, les nutriments qui peuvent être ajoutés et la quantité permise dans un aliment donné. Dans le Règlement, il existe actuellement une disposition traitant de l'ajout de vitamine D à des produits tels que le lait écrémé, le lait partiellement écrémé, la margarine et les œufs entiers liquides.

Santé Canada a reçu une demande afin de permettre l'ajout facultatif de levure contenant de la vitamine D2 aux produits de boulangerie levés à l'aide de levure en une quantité de 90 U.I. (2,25 µg) par 100 g. Santé Canada a effectué une évaluation de l'innocuité de la proposition consistant à enrichir les pains levés à l'aide de levure et les produits de boulangerie non normalisés levés à l'aide de levure tels que les croûtes à pizza, les préparations pour pain, les beignets, les croissants et les bagels. L'évaluation des données disponibles a démontré que l'ajout de vitamine D aux aliments décrits ci-dessus en une quantité pouvant atteindre 90 U.I. (2,25 µg) par 100 g de produit, sous leur forme consommable ne comporte aucun danger. L'évaluation a aussi

## Salvia divinorum

News Release: The Government of Canada Proposes to Schedule Salvia Divinorum and Salvinorin A as Controlled Substances (insert link)

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Certain websites promote the use of *S. divinorum* as a “legal” alternative to street drugs. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body; how it interacts with other substances, including other drugs, natural health products and alcohol; and the potential of *S. divinorum* to produce physical dependence and/or addiction.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects, which may include:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

### Legal Status of *Salvia divinorum*

#### In Canada

*S. divinorum* currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently scheduled under the *Controlled Drugs and Substances Act* (CDSA), Health Canada has issued a Notice to Interested Parties which proposes to include *S. divinorum* and salvinorin A as controlled substances under the CDSA. This means that activities such as possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting would be illegal unless authorized by regulation.

### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed similar controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed similar restrictions on their sale and/or import.

### **Research on the use of *Salvia divinorum* in Canada?**

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year.

### **Need More Info?**

For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:

- Consumers: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)
- Trade: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_38\\_trade-industrie\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_38_trade-industrie_cp-pc-eng.php). Or contact the **Health Products and Food Branch Inspectorate** directly by calling toll-free 1-800-267-9675.

To report an adverse reaction or interaction involving any health product, contact Health Canada at 1-866-234-2345 (toll free in Canada), or visit the [MedEffect Canada](http://www.health.gc.ca/medeffect) web section at: [www.health.gc.ca/medeffect](http://www.health.gc.ca/medeffect)

## **Media Lines** ***Salvia divinorum***

### **Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011 (TBC).

### **Key Messages:**

- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A.
- After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- Health Canada is continuing to survey the prevalence of salvia use and have based our proposed scheduling on available information and reports that suggest these substances have the potential for abuse, especially among young Canadians. The risks of salvia use include hallucinations, loss of consciousness and short-term memory loss.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

### **Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient

**DRAFT**

11/02/2011

salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 - What are the risks associated with the use of *Salvia divinorum***

A1 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

**Q2 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

**DRAFT**

11/02/2011

A2 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which will be published on February 19, 2011 (TBC) for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q3. Why has the Government now decided to schedule these substances under the CDSA?**

A3. Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q4 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A4 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

**DRAFT**

11/02/2011

Some individual U.S. states have implemented similar laws restricting their use, sale and/or distribution.

**Q5 – Is there any research on the use of *Salvia divinorum* in Canada?**

A5 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q6 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

A6 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q7 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A7 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.he-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.he-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**DRAFT**

11/02/2011

**Q8 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A8 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: [\(link to come\)](#). Health Canada also issued a news release on February XX announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011 (TBC), giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**DETAILED ITINERARY**

1255 hrs MP Glover arrives at the front doors of the YMCA, South Y, 5 Fermor Avenue, and is greeted by Angela Hildebrand, General Manager, YMCA, South Y and event Emcee; and Adele Novak, Regional Communications Officer, Health Canada. Angela Hildebrand and Adele Novak escort MP Glover to the holding room, Angela's Office (behind the front reception).

1300 hrs MP Glover and Angela Hildebrand arrive at the holding room and are joined by Jocelyn Kula, A/Director, Office of Controlled Substances, Health Canada.

A pitcher of water will be available in the briefing room.

1344 hrs MP Glover, Angela Hildebrand, and Jocelyn Kula depart holding room en route to the Multipurpose Room 2 where the announcement will take place.

1345 hrs Event begins. Angela Hildebrand welcomes everyone and introduces MP Glover.

---

**Open to media. Media will be set up behind the audience.**

---

1347 hrs MP Glover speaks.

1352 hrs Angela Hildebrand thanks MP Glover and introduces **second speaker (TBC)**

1353 hrs **Second speaker** speaks.

1357 hrs Angela Hildebrand thanks **second speaker**, and invites MP Glover and Jocelyn Kula to the podium to answer questions from the audience and media.

1407 hrs Event concludes. Photos may be taken.

1420 hrs MP Glover departs YMCA, South Y and proceeds to board her vehicle.

**Member of Parliament for Saint Boniface**

**Issue: Proposal to add Salvia Divinorum and Salvinorin  
A to Schedule III to the *Controlled Drugs and  
Substances Act*.**

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Une substance connue sous le nom de salvia continue de gagner en popularité chez les jeunes, et certains d'entre eux en abusent. En tant que mère et que policière, je peux vous assurer qu'il s'agit d'une question qui me préoccupe

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add Salvia

divinorum, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will have a 30-day period to comment on our proposal. While we are consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

L'ajout de la *salvia divinorum* à la liste des substances contrôlées rendrait illégales les activités mettant en cause la salvia, comme la possession, le trafic, l'importation et la culture.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young people in Hollywood using Salvia to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening. We want to help Mom and Dad.

Nous agissons rapidement dans ce dossier, parce que nous voulons protéger nos jeunes des méfaits associés à la salvia.

**Nous voulons éliminer les idées fausses selon lesquelles la salvia est un substitut sécuritaire aux drogues de la rue.**

**It is not.**

**All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like Salvia, particularly when they are in their teenage years.**

**I am happy to take your questions.**

**Thank you**

A to Schedule III to the *Controlled Drugs and  
Substances Act*.**

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Among today's youth, a substance known as Salvia has been gaining popularity, and is being abused by some young people. As a parent and a police officer, I can tell you that it's something I'm personally concerned about.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add *Salvia divinorum*, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will

have a 30-day period to comment on our proposal. While we are consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

Adding salvia divinorum to the list of controlled drugs and substances would make activities with salvia, such as possession, trafficking, importing or cultivating illegal.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young people in Hollywood using Salvia to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening. We want to help Mom and Dad.

We're acting quickly on this because we want to protect our young people from the harms associated with Salvia.

We want to eliminate the misconceptions that Salvia is a safe alternative to street drugs.

It is not.

All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like Salvia, particularly when they are in their teenage years.

I am happy to take your questions.

Thank you.

2011-XX

# News Release

## Harper Government Takes Action to Protect Families

February 21, 2011

For immediate release

Factsheet: *Salvia Divinorum* (insert link)

**OTTAWA** – Today, MP Shelly Glover (Saint Boniface), Parliamentary Secretary to the Minister of Finance, and the Honourable Christian Paradis, Minister of Natural Resources, announced on behalf of the Honourable Leona Aglukkaq, Minister of Health, the Harper Government's proposed intention to include *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal was published in *Canada Gazette*, Part I, on February 19, 2011.

"As a mother and police officer, I am pleased to see our Government take action to help parents protect their children from this dangerous substance," said P.S. Glover.

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the harmful effects of this substance," said Minister Paradis.

The Notice to Interested Parties proposes that *Salvia divinorum* and its main active ingredient salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation) would be illegal unless authorized by regulation. The scheduling of *Salvia divinorum* and salvinorin A as a controlled substance would also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 21, 2011.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

## Fiche de renseignements Février 2011

---

### ***Salvia divinorum***

---

Communiqué de presse : Le gouvernement du Canada propose d'ajouter la salvia et la salvinorine A à la liste des substances contrôlées (insérer le lien)

La *salvia divinorum* (la salvia) est une espèce de sauge de la famille des labiacées. Certains sites Web encouragent la consommation de salvia comme substitut légal aux drogues de la rue. Les produits se vendent sous plusieurs formes, notamment en feuilles fraîches ou séchées, en liquides ou en graines et en boutures pour la culture.

Les Canadiens doivent éviter de consommer des produits contenant de la salvia, car il s'agit d'une substance hallucinogène dont on connaît mal les effets à long terme sur le cerveau et l'organisme, la façon dont elle interagit avec d'autres substances, comme d'autres drogues, des produits de santé naturel et l'alcool, et le risque de dépendance physique ou de toxicomanie associé à la consommation de la salvia.

#### **Risques associés à la consommation de salvia**

La salvia a des effets physiques et mentaux connus qui peuvent comprendre les suivants :

- hallucinations
- dysphorie (sentiment d'angoisse, de dépression ou d'agitation)
- expériences extracorporelles
- rire incontrôlable
- évanouissement
- perte de mémoire immédiate
- manque de coordination des mouvements
- trouble de l'élocution et phrases maladroites

#### **Statut juridique de la *salvia***

##### Au Canada

La salvia correspond présentement à la définition d'un produit de santé naturel que donne le *Règlement sur les produits de santé naturels*. En février 2011, Santé Canada n'avait toujours pas homologué de produit de santé naturel contenant de la salvia. Conformément à la *Loi sur les aliments et drogues*, Santé Canada peut prendre des mesures coercitives à l'égard de quiconque vend des produits de santé naturels non homologués contenant de la salvia ou son principal ingrédient actif, la salvinorine A.

Si la salvia et la salvinorine A ne sont pas, à l'heure actuelle, considérées comme des substances contrôlées en vertu de la *Loi réglementant certaines drogues et autres substances*, Santé Canada a toutefois émis un avis aux parties intéressées dans lequel il propose de les ajouter à l'annexe III de la *Loi*. Cela signifie que les activités comme la possession, le trafic, l'importation, l'exportation, la production (ou la culture), la

possession en vue du trafic ou la possession en vue de l'exportation seraient illégales à moins d'être autorisées par réglementation.

#### À l'étranger

Plusieurs pays, notamment l'Australie, la Belgique, l'Allemagne, l'Italie et le Japon, réglementent l'importation et la vente de la salvia et de la salvinorine A.

Aux États-Unis, la salvia et la salvinorine A ne sont pas réglementées en vertu de la *Loi sur les substances contrôlées*, mais certains États ont adopté des mesures visant à en restreindre la vente et l'importation.

#### **Recherche sur l'utilisation de la *Salvia divinorum* au Canada**

L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues révèle qu'en 2009, 1,6 % des Canadiens ont déclaré avoir consommé de la salvia au moins une fois et que la consommation est beaucoup plus élevée (7,3 %) chez les jeunes de 15 à 24 ans. L'Enquête canadienne 2008-2009 sur le tabagisme chez les jeunes montre que 5 % des jeunes de 15 ans avaient consommé de la salvia au cours de l'année précédente. Selon le Sondage 2009 sur la consommation de drogues et la santé des étudiants de l'Ontario, 5,4 % des étudiants ontariens de la 7<sup>e</sup> à la 12<sup>e</sup> année ont déclaré avoir déjà consommé de la salvia, et 4,4 % d'entre eux ont affirmé en avoir consommée au cours au cours de l'année précédente.

#### **Pour en savoir plus**

Pour savoir comment présenter une plainte concernant la vente non autorisée de produits de santé contenant de la salvia, veuillez consulter le document pertinent ci-dessous :

# News Release

## Le gouvernement Harper prend des mesures pour protéger les familles

Le 21 février 2011

Pour diffusion immédiate

Fiche de renseignements : *Salvia divinorum* ([insert link](#))

OTTAWA – Aujourd'hui, la députée Shelly Glover (Saint-Boniface), Secrétaire parlementaire du ministre des Finances, et l'honorable Christian Paradis, ministre des Ressources naturelles, ont annoncé, au nom de l'honorable Leona Aglukkaq, ministre de la Santé, que le gouvernement Harper avait l'intention d'ajouter la *salvia divinorum* et la salvinorine A à la liste des substances contrôlées. Un Avis aux intéressés décrivant la proposition de Santé Canada a été publié dans la *Gazette du Canada*, Partie I, le 19 février 2011.

« En tant que mère et que policière, je suis heureuse que le gouvernement intervienne pour aider les parents à protéger leurs enfants contre cette substance dangereuse », a indiqué M<sup>me</sup> Glover.

« Après avoir pris connaissance des données de surveillance et des rapports scientifiques canadiens indiquant que certaines personnes, surtout les jeunes, pourraient abuser de la salvia, nous entendons protéger les Canadiens contre les effets dangereux de cette substance », a déclaré la ministre Paradis.

L'Avis aux intéressés propose d'ajouter la *salvia divinorum* et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances*. Cela signifie que les activités comme la possession, le trafic, la possession en vue du trafic, l'importation, l'exportation, la possession en vue de l'exportation et la production (ou la culture) seraient illégales à moins d'être autorisées par réglementation. L'ajout de la *salvia divinorum* et de la salvinorine A à la liste des substances contrôlées permettrait aux organismes d'application de la loi de lutter contre les activités présumées illégales impliquant ces substances.

Les intervenants sont invités à faire parvenir leurs commentaires sur l'Avis aux intéressés d'ici le 14 mars 2011.

Pour de plus amples renseignements sur la salvia et les risques associés à son utilisation,  
veuillez consulter l'article de *Votre santé et vous* à : (insert link to the *It's Your Health*  
article.)

**Discours de  
l'honorable Christian Paradis,  
ministre des Ressources naturelles**

**Question : Proposition d'ajouter la *salvia divinorum* et la  
salvinorine A à l'annexe III de la *Loi réglementant  
certaines drogues et autres substances***

**Date : le 21 février 2011**

Seul le texte prononcé fait foi

Bonjour,

Je tiens à vous remercier de vous être joints à moi aujourd'hui pour ce que je considère une annonce très importante pour les familles canadiennes, annonce qui contribuera à la sécurité des collectivités.

Une substance connue sous le nom de salvia continue de gagner en popularité chez les jeunes, et certains d'entre eux en abusent.

Cette substance est populaire, car elle peut avoir les mêmes effets que certaines drogues illicites. Il y a aussi une fausse impression selon laquelle elle est sans danger.

Mais ce n'est pas le cas.

La salvia peut être très dangereuse.

Elle cause parfois des hallucinations et peut avoir d'autres effets néfastes sur le cerveau et l'organisme. À l'heure actuelle, les effets à long terme de cette substance sont peu connus.

L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues de 2009 révèle qu'en 2009, 1,6 % des Canadiens de 15 ans et plus ont consommé de la *salvia divinorum* au moins une fois dans leur vie et que la consommation est beaucoup plus élevée (7,3 %) chez les jeunes de 15 à 24 ans.

De plus, les résultats de l'Enquête sur le tabagisme chez les jeunes 2008-2009, menée au Canada, révèlent que 5 % des jeunes de 15 ans ont consommé de la *salvia divinorum* au cours de l'année précédent l'enquête.

En raison des risques possibles pour la santé des Canadiens, en particulier celle des jeunes, nous proposons d'ajouter la *salvia divinorum*, et son principal ingrédient actif, la salvinorine A, à la *Loi réglementant certaines drogues et autres substances*.

Ces substances doivent être réglementées, tout comme les autres drogues illicites.

Dans un premier temps, un avis a été publié dans la *Gazette du Canada* au cours de la fin de semaine dernière, de sorte que tous les Canadiens disposent de 30 jours pour émettre leurs commentaires au sujet de notre proposition. Alors que nous consultons les Canadiens, notre position est claire. Nous voulons aider les parents, les familles et les collectivités à assurer la sécurité de nos enfants.

L'ajout de la *salvia divinorum* à la liste des substances contrôlées rendrait illégales les activités mettant en cause la salvia, comme la possession, le trafic, l'importation et la culture.

Ces mesures vont dans le sens de celles adoptés par d'autres pays, notamment l'Australie, la Belgique, l'Allemagne, l'Italie et le Japon, qui ont tous mis en place des contrôles semblables qui s'appliquent à l'importation ou à la vente de la *salvia*.

Le fait est que nos adolescents subissent déjà suffisamment de pression. Et, avec des histoires dans les médias de jeunes gens à Hollywood qui utilisent la salvia pour son effet euphorique, nous avons la responsabilité de faire ce qu'il faut pour protéger nos jeunes. Dans une économie aussi fragile que celle que nous connaissons présentement, les mères et les pères ne peuvent tout simplement pas se permettre de toujours surveiller ce que leurs jeunes font.

Ce que nous voulons, c'est aider ces parents.

Nous agissons rapidement dans ce dossier, parce que nous voulons protéger nos jeunes des méfaits associés à la salvia.

Nous voulons éliminer les idées fausses selon lesquelles la salvia est un substitut sécuritaire aux drogues de la rue.

Ce n'est pas le cas.

Toutes les mesures que nous prenons visent à protéger la santé et la sécurité des Canadiens des effets néfastes que peut avoir cette substance. Nous savons que les parents veulent que leurs enfants soient protégés contre les substances comme la salvia, surtout pendant leur adolescence.

C'est avec plaisir que je répondrai maintenant à vos questions.

Merci.

**Speech for  
The Honourable Christian Paradis,  
Minister of Natural Resources**

**Issue: Proposal to add Salvia Divinorum and Salvinorin  
A to Schedule III to the *Controlled Drugs and  
Substances Act*.**

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Among today's youth, a substance known as Salvia has been gaining popularity, and is being abused by some young people.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add *Salvia divinorum*, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will have a 30-day period to comment on our proposal. While we are

consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

Adding salvia divinorum to the list of controlled drugs and substances would make activities with salvia, such as possession, trafficking, importing or cultivating illegal.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young Hollywood using this salvia to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening.

We want to help Mom and Dad.

We're acting quickly on this because we want to protect our young people from the harms associated with Salvia.

We want to eliminate the misconceptions that Salvia is a safe alternative to street drugs.

It is not.

All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like Salvia, particularly when they are in their teenage years.

I would now be happy to take your questions.

Thank you.

Subject: Fw: Notice to Stakeholders on Salvia

Hi Jocelyn,

In preparing to send the Salvia NOI notification through the SIMS database, Isabel has indicated that she is not familiar with the database itself and isn't comfortable sending out the notification particularly given the number of stakeholders involved. Catherine has indicated that while she is too busy to help Isabel send out the notification today, she can help us tomorrow morning. Therefore, we will be sending the notification of the NOI at that time.

FYI - As of noon today we had already received approx. 15 emails with regard to the NOI, all of which were critical of the proposal.

Regards,

Stephanie

Si vous souhaitez mettre à jour votre statut en tant que personne-ressource, veuillez envoyer une demande par courriel à [PLA.info.DLMM@hc-sc.gc.ca](mailto:PLA.info.DLMM@hc-sc.gc.ca) pour les Demandes de licence de mise en marché ou à [SLA.info.DLE@hc-sc.gc.ca](mailto:SLA.info.DLE@hc-sc.gc.ca) pour les Demandes

de licence d'exploitation.

Dear Sir/Madam:

The purpose of this email is to advise you that a *Notice of Intent to Interested Parties* (NOI) regarding the following substances was published in the *Canada Gazette*, Part I on February 19, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:

<http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf>, pages 8-9 in PDF format (pages 438-439 in *Canada Gazette*, Part I).

This NOI outlines Health Canada's proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulatory controls.

If you are interested in this process or wish to provide us with information for our consideration, please do so by March 21, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

PLEASE FORWARD THIS EMAIL TO OTHERS WHO MAY BE INTERESTED.

~~Should this notification have reached you in error, it would be appreciated if you could please forward it to the appropriate person in your organization and ask that person to inform us of this by sending an e-mail to:-~~

Thank you,

Regulatory Policy Division  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate  
Healthy Environments and Consumer Safety Branch

\*\*\*\*\*

Madame, Monsieur,

Le présent courriel a pour but de vous informer qu'un Avis d'intention aux parties intéressées concernant les substances ci-dessous a été publié dans la Partie I de la Gazette du Canada, le 19 février 2011:

- Salvia divinorum (sauge des devins)
- Salvinatorine A

La version électronique de l'Avis d'intention est disponible à l'adresse Internet <http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf>, pages 8-9, en format PDF (pages 438-439 dans la Partie I de la *Gazette du Canada* ).

Cet avis d'intention décrit la proposition de Santé Canada qui consiste à inclure la Salvia divinorum (sauge des devins) et la salvinatorine A dans l'annexe III de la Loi réglementant certaines drogues et autres substances. Santé Canada cherche précisément à obtenir plus d'information de la part des intervenants afin de déterminer si ces substances ont une utilité légitime sur les plans industriel, scientifique ou médical au Canada. Les renseignements qui seront obtenus permettront de prendre des mesures réglementaires appropriées.

Si vous désirez participer à ce processus ou tout simplement nous fournir de l'information, veuillez communiquer avec nous d'ici le 21 mars 2011. Vous pouvez envoyer vos commentaires par la poste à Stephanie Chandler, Division de la politique réglementaire, Bureau des substances contrôlées, indice de l'adresse : 3503D, 123 rue Slater, Ottawa, Ontario, Canada K1A 1B9, par télécopieur, au 613-946-4224, ou par courriel à [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

**VEUILLEZ TRANSFÉRER LE PRÉSENT COURRIEL AUX PERSONNES QUI POURRAIENT ÊTRE INTÉRESSÉES.**

~~Si vous avez reçu cet avis par erreur, nous vous saurions gré de le transférer à la personne concernée de votre organisation et de lui demander de nous en informer par courriel à : [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).~~

Merci.

Subject: Salvia Debrief

---

So it all went off OK. Full briefing for Shelley Glover (the MP) beforehand but then I had a very backseat role during the announcement itself. Lots of media attendance- all major outlets were represented and Ms Glover took questions for over 10 mins afterwards (which is apparently unusual for out here). I did a short interview for CTV afterwards and that went fine I guess (I am no media star).

Apparently the RPD email has already had quite a few hits in response to the NOI; all from harm reduction advocates/ users who are not in favour....

**Cc:** Alastair Sinclair; Dave Stephens; Nicole Prentice  
**Subject:** Re: Media query - CBC Sask - [REDACTED] - Salvia

Dave - this response is taken directly from the NOI and the last para from the MLs. We can drop the last para if you like and just go with para 1 & 2. Please advise.

**Q - What is the intention of the federal government; to ban this substance completely or to tighten control of access through a regulatory change?**

A; Including these substances within Schedule III to the CDSA would prohibit possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The scheduling of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Date: 2011-02-21 04:40 PM  
Subject: Fw: URGENT MEDIA ENQUIRY - Salvia - [REDACTED] (La Presse) - COB DEADLINE

FYI only - we provided the following response to this media inquiry from approved text:

**Q1A - What is the legal status of salvia? If I have this substance right now, can I be arrested or fined?**

A1A - Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA. To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*. The Natural Health Products Regulations do not apply to the possession of natural health products and/or ingredients for personal use.

**Q2 - Is the addition of salvia to the list of controlled substances effective as of today?**

A2 - No. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties (NOI)* in *Canada Gazette, Part I*, which was published on February 19, 2011 for a 30-day comment period, ending March 21, 2011. This Notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q3 - What is salvia?**

Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at:

<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Subject: URGENT MEDIA ENQUIRY - Salvia - [REDACTED] (La Presse) - COB DEADLINE

Good afternoon,

We've received a media enquiry from [REDACTED] with La Presse. Her deadline is COB. The questions look to be relatively straightforward. I don't have an approved version of the media lines yet, but I suspect the answer will lie within.

I've enclosed the questions in both French and English.

Q1 - Quel est le statut juridique de la salvia? Par exemple, si je possède présentement cette substance, puis-je être arrêtée ou être passible d'amende?

Q2 - Est-ce que l'ajout de cette substance à la liste des substances contrôlées est en vigueur à partir d'aujourd'hui?

Q3 - Qu'est-ce que la salvia?

Q1 - What is the legal status of salvia? i.e., if I have this substance right now, can I be arrested or fined?

Q2 - Is the addition of salvia to the list of controlled substances effective as of today?

Q3 - What is salvia?

Please advise if we will have responses before COB.

Thanks,

Leslie.

## About Health Canada

### **Salvia divinorum**

#### **Fact Sheet**

February 2011

#### **News Release: Harper Government Takes Action to Protect Families**

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body; how it interacts with other substances, including other drugs, natural health products and alcohol; and the potential of *S. divinorum* to produce physical dependence and/or addiction.

#### **Risks Associated with the Use of *Salvia divinorum***

*S. divinorum* is known to have both physical and mental effects, which may include:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

#### **Legal Status of *Salvia divinorum***

##### **In Canada**

*S. divinorum* currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently scheduled under the *Controlled Drugs and Substances Act* (CDSA), Health Canada has issued a Notice to Interested Parties which proposes to include *S. divinorum* and salvinorin A as controlled substances under the CDSA. This means that activities such as possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting would be illegal unless authorized by regulation

## In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed similar controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed similar restrictions on their sale and/or import.

## Research on the use of *Salvia divinorum* in Canada?

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The *2009 Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year.

## Need More Info?

For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:

- [Consumers](#)
- [Trade](#) Or contact the **Health Products and Food Branch Inspectorate** directly by calling toll-free 1-800-267-9675.

To report an adverse reaction or interaction involving any health product, contact Health Canada at 1-866-234-2345 (toll free in Canada), or visit the [MedEffect Canada](http://www.health.gc.ca/medeffect) web section at: [www.health.gc.ca/medeffect](http://www.health.gc.ca/medeffect)

For more information on the risks of using Salvia, please see [It's Your Health](#).

## Healthy Living

### Salvia divinorum

#### It's Your Health

##### On this page:

- [The Issue](#)
- [Risks Associated with the Use of Salvia divinorum](#)
- [Minimizing Your Risk](#)
- [Legal Status of Salvia divinorum](#)
- [Background](#)
- [Health Canada's Role](#)
- [Need More Info?](#)

#### The Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Certain websites promote the use of *S. divinorum* as a "legal" alternative to street drugs. Recent Canadian surveillance data indicates that Canadian teens and young adults are using *S. divinorum* for its ability to produce [hallucinations](#). Scientific reports also suggest that it has the potential for abuse.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use.

In light of this information, Health Canada is proposing to schedule both *S. divinorum* and its main active ingredient salvinorin A under Schedule III to the [Controlled Drugs and Substances Act \(CDSA\)](#) in order to protect the health and safety of Canadians, particularly youth.

#### Risks Associated with the Use of Salvia divinorum

*S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances)
- how it is taken, for example, whether the product is chewed, swallowed or smoked
- the user's mood and expectations

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage
- how it interacts with other substances, including other drugs, natural health products and alcohol
- the potential of *S. divinorum* to produce physical dependence and/or addiction

## Minimizing Your Risk

Hallucinogens like *S. divinorum* work by modifying functions in the brain. Health Canada recommends that you should not use *S. divinorum* because little is known about the long-term effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using [illegal drugs](#), such as [marijuana](#), [cocaine](#), [ecstasy](#), [LSD](#) and [other substances](#) that distort reality. See the [Need More Info](#) section below for links to resources that can help you with this.

## Legal Status of Salvia divinorum

### In Canada

---

As *S. divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the [Natural Health Products Regulations](#). As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the [Food and Drugs Act](#).

While *S. divinorum* and salvinorin A are not currently scheduled under the [Controlled Drugs and Substances Act \(CDSA\)](#), Health Canada has issued a Notice to Interested Parties which proposes to include *S. divinorum* and salvinorin A as controlled substances to the CDSA. This means that activities such as possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting would be illegal unless authorized by regulation.

### In Other Countries

---

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed similar controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed similar restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution. In some states, for example, it is illegal for *S. divinorum* to be sold to anyone under the age of 18.

## Background

The leaves of this plant have been used traditionally by the Mazatec people for medicinal and mystical purposes.

The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The *2009 Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. For more information on these surveys, see the *Need More Info* section below.

## Health Canada's Role

As noted above, in light of the health and safety risks associated with the use of *S. divinorum* and particularly the risks to youth, [Health Canada](#) is taking steps to schedule *S. divinorum* and salvinorin A under the Controlled Drugs and Substances Act.

## Need More Info?

For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:

- [How to Submit a Consumer Complaint](#)
- [How to Submit a Trade Complaint](#)

Or contact the [Health Products and Food Branch Inspectorate](#) directly by calling toll-free 1-800-267-9675.

To report an adverse reaction or interaction involving any health product, contact Health Canada at 1-866-234-2345 (toll free in Canada), or visit the [MedEffect Canada](#) web section

## About Health Canada

### Harper Government Takes Action to Protect Families

#### News Release

2011-29

February 21, 2011

For immediate release

#### Factsheet: *Salvia Divinorum*

**OTTAWA** - Today, the Honourable Christian Paradis, Minister of Natural Resources, and MP Shelly Glover (Saint Boniface), Parliamentary Secretary to the Minister of Finance, announced on behalf of the Honourable Leona Aglukkaq, Minister of Health, the Harper Government's proposed intention to include *Salvia divinorum* and salvinorin A, also known as *Salvia*, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal was published in *Canada Gazette*, Part I, on February 19, 2011.

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the harmful effects of this substance," said Minister Paradis.

"As a mother and police officer, I am pleased to see our Government take action to help parents protect their children from this dangerous substance," said P.S. Glover.

The Notice to Interested Parties proposes that *Salvia divinorum* and its main active ingredient salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation) would be illegal unless authorized by regulation. The scheduling of *Salvia divinorum* and salvinorin A as a controlled substance would also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 21, 2011.

For more information on *Salvia divinorum* and the risks associated with its use, please see [It's Your Health](#).

## Health Canada proposes ban on hallucinogen salvia

*The Canadian Press*

*Updated: Sat. Feb. 19 2011 8:18 AM ET*

OTTAWA — The federal government is proposing to ground "psychonauts" from taking any more psychedelic trips on salvia divinorum.

Health Canada has posted notice of its intention to ban the potent hallucinogenic herb and its active ingredient, salvinorin A.

It is proposing to add both to the Controlled Drugs and Substances Act, making it illegal to produce, possess, traffic, import or export the substances.

The notice, posted Feb. 4 on the Canada Gazette, gives stakeholders 30 days in which to comment.

Currently, salvia --also known as magic mint and diviner's sage -- is considered a natural health product. As such, it is supposedly illegal to sell it without authorization from Health Canada.

Health Canada has given no such authorization but the agency appears to have done little to enforce its regulations.

Salvia is readily available at head shops across the country and through the Internet, touted as a perfectly legal hallucinogen. As recently as last fall, head shops within a stone's throw of Parliament Hill were openly selling vials of salvia extract for \$20 to \$80 per gram, depending on the potency.

Users of salvia have sometimes referred to themselves as psychonauts on YouTube videos of their trips

Police have long complained they're powerless to halt the sale of salvia, which has been known to produce some adverse reactions, including one case reported by Health Canada in 2006 in which an incoherent, suicidal teenage boy threatened to kill police officers. Police have no jurisdiction to enforce natural health product regulations.

Adding salvia divinorum and salvinorin A to the Controlled Drugs and Substances Act would finally "enable law enforcement agencies to take action against suspected illegal activities involving these substances," Health Canada says in the notice.

It adds that salvia has been "reported to be one of the most prevalent herbal products used as an alternative to illicit drugs."

The Canadian Alcohol and Drug Use Monitoring Survey in 2009 found 7.3 per cent of youths aged 15-24 reported having used salvia at least once.

Because the effects of salvia are similar to those of LSD and other controlled hallucinogenic drugs, "Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth," the notice says.

Other countries, including Australia, Belgium, Denmark, Finland, Germany, Italy, Spain and Sweden, have already regulated or banned salvia, as have some dozen states in the U.S.

**Fw: CTV National News - Government mulls ban of drug "salvia" - February  
21 2011 - 23:00**

2011-02-22 09:24 AM

I don't know where the reporter got the following statistics: STUDIES SHOW 17% OF 15 TO 24 YEAR OLDS USED SALVIA IN 2009. THAT'S LITTLE COMPARED TO CANADA BUST AT -- CANNABIS AT 26%.

These are the revised stats we are using from Suzanne last night:

A5 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of students grades 7-12 have used *Salvia divinorum* in the past year. This represents about 123,000 Canadian high-school students. The *2009 Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Government mulls ban of drug "salvia"

TO HEALTH NEWS NOW AND NEW CONCERNS ABOUT A PLANT MANY CANADIANS HAVE NOT HEARD ABOUT. IT'S CALLED SALVIA. AS GENEVIEVE BEAUCHEMIN REPORTS, OTTAWA SAYS IT'S TIME SALVIA WENT FROM NATURAL HERB TO ILLEGAL SUBSTANCE.  
Reporter: ALONG SIDE HEMP CLOSING AND BOUTIQUE UTOPIA, A PSYCHEDELIC HERB THAT THE GOVERNMENT NOW WANTS TO BAN.  
OR YOU MIGHT JUST BE LAUGHING OR YOU MIGHT FEEL LIKE YOU WANT TO -- YOU KNOW, YOU FEEL ENERGIZED.  
Reporter: SALVIA CAUSES HALLUCINATIONS AND WHAT SOME USERS DESCRIBE AS AN OUT-OF-BODY EXPERIENCE.  
BUT IT HAS GARNERED MUCH ATTENTION BECAUSE OF THE HOLLYWOOD STORIES.  
Reporter: STORIES LIKE TEEN STAR MILEY CYRUS WHO INHALED ON A VIDEO LAST YEAR. THE SALE  
ISN'T LICENSED BY CANADA, BUT IT'S ALSO NOT ILLEGAL. THE GOVERNMENT SAYS THERE HAS BEEN ADVERSE REACTIONS AND IT IS TIME TO INCLUDE IT IN THE CONTROLLED DRUGS AND SUBSTANCES ACT LIKE MARIJUANA, COCAINE.

WE'RE TAKING PRO-ACTIVE MEASURES TO ENSURE THAT WE ADDRESS SALVIA RIGHT NOW. BECAUSE WE WANT TO MAKE SURE THAT OUR KIDS ARE SAFE.

Reporter: SAFE FROM MEMORY LOSS, HALLUCINATIONS, ANXIETY, AND POTENTIAL LONG-TERM EFFECTS SAYS HEALTH CANADA.

VERY LITTLE CONTROLLED STUDIES HAVE BEEN DONE ON THE EFFECTS OF SALVIA ON THE BODY.

Reporter: BUT AT UTOPIA, ALEX SAYS THAT LACK OF EVIDENCE IS ACTUALLY PART OF THE REASON HE'LL BE PUSHING BACK AGAINST THE BAN. HE SAYS THERE'S MORE.

IT WOULD BE THE WORST OF ALL WORLDS. IF WE BAN IT, WE GIVE A NEW INCOME SOURCE TO ALL CRIMINAL ORGANIZATIONS.

Reporter: BUT HE DOES SAY HE'LL BE SUGGESTING IT BE RESTRICTED AS IT IS IN SOME STATES SOUTH OF THE BORDER WHERE IT IS ILLEGAL TO SELL SALVIA TO THOSE UNDER 21, JUST LIKE ALCOHOL. BEFORE FINALIZING ITS DECISION TO INCLUDE SALVIA AS A CONTROLLED SUBSTANCE,

**SUBJECT - SUJET**

English:

**DRUGS - SALVIA DIVINORUM**

Français:

**DROGUES - SALVIA DIVINORUM**

**SYNOPSIS - SOMMAIRE**

English:

EMBARGOED UNTIL FEBRUARY 19, 2011.

Media interest in Salvia divinorum is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows a young celebrity smoking Salvia divinorum. Canadian surveillance data indicates that this substance is being used by adolescents and young adults for its hallucinogenic properties, and there have also been several reports from scientific sources indicating that Salvia divinorum has a potential for abuse.

**ANTICIPATED QUESTION - QUESTION PRÉVUE**

English:

What is Health Canada doing to protect young Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les jeunes Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

---

English:

- Health Canada is proposing to regulate Salvia as a controlled substance in order to protect the health and safety of Canadians, particularly youth.
- Health Canada has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate Salvia as a controlled substance.
- The regulation of Salvia would make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.

Français:

---

## BACKGROUND - CONTEXTE

English:

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects which are often described as unpleasant, including:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Current Situation in Canada

As *Salvia divinorum* is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. To date, Health Canada has not licensed for sale any natural health product which contains *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

Health Canada is proposing that *S. divinorum* and Salvinorin A be included in Schedule III to the CDSA. This would mean that the possession, trafficking, importation, exportation and production of *Salvia divinorum* and salvinorin A would be illegal unless authorized by regulation. The regulation of *Salvia divinorum* and Salvinorin A as controlled substances would allow law enforcement to take action against illegal activities involving this substance.

International Control of *S. divinorum*

Neither *Salvia divinorum* nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the (CDSA) is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

**Subject:** Salvia divinorum - Notice to Interested Parties / Avis d'intention aux parties intéressées

[le français suit]

Dear Sir/Madam:

The purpose of this email is to advise you that a *Notice of Intent to Interested Parties* (NOI) regarding the following substances was published in the *Canada Gazette* , Part I on February 19, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:

<http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf> , pages 8-9 in PDF format (pages 438-439 in *Canada Gazette* , Part I).

This NOI outlines Health Canada's proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulatory controls.

If you are interested in this process or wish to provide us with information for our consideration please do so by March 21, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

PLEASE FORWARD THIS EMAIL TO OTHERS WHO MAY BE INTERESTED.

Should this notification have reached you in error, it would be appreciated if you could please forward it to the appropriate person in your organization and ask that person to inform us of this by sending an e-mail to: [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

Madame, Monsieur,

Le présent courriel a pour but de vous informer qu'un *Avis d'intention aux parties intéressées*

concernant les substances ci-dessous a été publié dans la Partie I de la *Gazette du Canada* , le 19 février 2011:

- *Salvia divinorum* (sauge des devins)
- Salvinorine A

La version électronique de l'Avis d'intention est disponible à l'adresse Internet <http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf> , pages 8-9 ,en format PDF (pages 438-439 dans la Partie I de la *Gazette du Canada* ).

Cet avis d'intention décrit la proposition de Santé Canada qui consiste à inclure la *Salvia divinorum* (sauge des devins) et la salvinorine A dans l'annexe III de la *Loi réglementant certaines drogues et autres substances* . Santé Canada cherche précisément à obtenir plus d'information de la part des intervenants afin de déterminer si ces substances ont une utilité légitime sur les plans industriel, scientifique ou médical au Canada. Les renseignements qui seront obtenus permettront de prendre des mesures réglementaires appropriées.

Si vous désirez participer à ce processus ou tout simplement nous fournir de l'information, veuillez communiquer avec nous d'ici le 21 mars 2011. Jocelyn - I spoke with Suzanne by phone and she will be sending me shortly some points I can make in the editorial re: the scientific evidence that it is harmful. For the rest of the letter, I will use info from the Salvia comms products. Please make yourselves available to review and approve the letter this morning. thanks.

Subject: Letter to the editor requested for today

To be signed by both our Ministers.  
We will draft and share before noon

Attached is the editorial from today's Winipeg Free Press  
No need to ban salvia -

Editorial St. Boniface MP Shelly Glover may well be -- along with all the other parents she insists share her fears -- "very worried about the long-term effects" of salvia divinorum, but until that or some other evil of smoking this herb is established by scientific evidence, the hallucinogen ought not be banned. There is little science that says it is dangerous to human health and safety.

Salvia, regulated in Canada as a natural health product, has been compared to marijuana, except that it produces more often a wild psychedelic trip rather than a cosy high. Those who smoke, inhale or chew it can experience an out-of-body sensation or the sense that they become inanimate objects, such as a table leg. Others collapse into laughing fits. Infamously, Miley Cyrus was sure that a guy at her party looked exactly like her boyfriend. Ms. Cyrus' mini-trip wrote salvia onto the parental watch lists -- who would want their newly minted 18-year-old to indelibly imprint their own "this is your brain on salvia" on YouTube? Ms. Glover and fellow MPs in the Harper government seem to be taking their drug-watch cues from YouTube and the alarmist anecdotes of legislators in other countries who have acted rashly to ban salvia, a member of the mint family used traditionally by Mexico's Mazatec natives to produce spiritual visions. The hallucinations can be intense, but are short-lived.

There is no evidence salvia is addictive or toxic. Ms. Glover is probably right on the money when she says most parents would not want their children smoking salvia. It should probably be regulated, like alcohol. Making an herb's sale, cultivation or possession punishable as a criminal offence, simply because it makes people see weird things or act funny, is hammering up a solution to a non-problem.

**Response to Editorial in today's Winnipeg Free Press  
No need to ban salvia -**

We would like to respond to the February 23 editorial on the Government's recent proposal to control *Salvia divinorum* and salvinorin A.

Deleted: .

We want to eliminate the misconception that salvia is a safer alternative to street drugs.

It is not.

*Salvia divinorum*, and its active ingredient salvinorin A, produce powerful hallucinations similar to those associated with the use of the well-known hallucinogen LSD, which is a controlled substance. Other effects include confusion, disorientation, and anxiety.

In Canada, about 7% of youth aged 15-24 have tried salvia. This represents about 300,000 young people - a rate that is similar to that of cocaine and ecstasy, and a rate much higher than that of LSD.

The move to control these substances is also consistent with actions taken by several other countries such as Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden, who have all placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some U.S. states have taken action to restrict their use, sale and/or distribution.

A situation where an increasing number of Canadians, and particularly youth, are using a potent hallucinogen, which has no demonstrated benefits but known toxic effects, calls for controls to reduce access to these substances. This is what the Government of Canada is doing by proposing to regulate them under the *Controlled Drugs and Substances Act*.

**Response to Editorial in today's Winnipeg Free Press  
No need to ban salvia -**

We would like to respond to the February 23 editorial in the *Winnipeg Free Press* commenting on the Government's recent proposal to control *Salvia divinorum* and salvinorin A, like other-illicit drugs.

Formatted: Font: Italic

These substances present potential risks to the health and safety of Canadians, particularly our young people, and that is why we are taking this step now.

We want to eliminate the misconceptions that *Salvia* is a "safe" alternative to street drugs.

It is not.

*Salvia divinorum*, and its active ingredient salvinorin A, produce powerful hallucinations similar to those associated with the use of the well-known hallucinogen LSD, which is regulated as a controlled substance. Other effects include further alterations in mental state such as confusion, disorientation, and anxiety.

Comment [JK1]: We all commented on the use of this language in the speech so do we really want to perpetuate it here? Maybe we could say "safer alternative to ~~street drugs like marijuana or~~ any

*nicot drug*

In addition, the risk of experiencing more severe adverse mental and physical reactions may increase when *Salvia* is consumed along with other psychoactive substances.

Taken together, these findings strongly suggest that *Salvia* does in fact pose a danger to the health and safety of Canadians because it can profoundly alter a person's mental and potentially physical well-being.

In Canada, about 7% of youth age 15-24 have tried *Salvia*. This represents about 423,000 young people - a rate that is similar to that of cocaine and ecstasy, and a rate much higher than that of LSD.

While less information is available regarding the long-term health effects of using *Salvia* compared to other drugs like cocaine, this in no way implies that *Salvia* is safe or that it does not have long-term effects on health.

The move to control these substances is also consistent with actions taken by several other countries such as Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden, who have all placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some U.S. states have also taken action to restrict their use, sale and/or distribution.

A situation where an increasing number of Canadians, and particularly youth, are using a potent hallucinogen, which has no demonstrated benefits but known toxic effects, calls for controls to reduce access to these substances and this is what the Government of Canada is doing by proposing to schedule *Salvia divinorum* and salvinorin A regulate it under the *Controlled Drugs and Substances Act*.

Other effects associated with the use of salvia include further alterations in mental state such as confusion, disorientation, and anxiety.

In addition, the risk of experiencing more severe adverse mental and physical reactions increases when salvia is consumed along with other psychoactive substances.

Taken together, these findings strongly suggest that salvia does in fact pose a danger to human health and safety because it can profoundly alter a person's mental and physical well-being.

In Canada, about 7% of youth age 15-24 have tried salvia, a rate that is similar to that of cocaine and ecstasy and a rate much higher than that of LSD. Easy availability and the false perception that it is safe are likely factors to explain such a rate of use for a substance that is not as well known as cocaine and ecstasy.

While less information is available regarding the long-term health effects of using salvia compared to other drugs like cocaine, this in no way implies that salvia is safe or that it does not have long-term effects on health. Rather, because this is an emerging substance further studies are required to establish with more certainty what those effects may be. What is known is that no beneficial health effects have been reported.

A situation where an increasing number of Canadians, and particularly youth, are using a potent hallucinogen, which has no demonstrated benefits but known toxic effects, calls for controls to reduce access to this substances and this is what the Government of Canada is doing by proposing to regulate it under the *Controlled Drugs and Substances Act*.

Hi everyone, The Minister has been invited to a...

2011-02-22 12:30:04 PM

## ADVICE TO THE MINISTER

### SUBJECT / SUJET

**Salvia Divinorum**

### SYNOPSIS / SOMMAIRE

On February 19, 2011, Health Canada published a Notice to Interested Parties proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A under Schedule III to the Controlled Drugs and Substances Act (CDSA) in order to protect the health and safety of Canadians, particularly youth.

### ANTICIPATED QUESTION/QUESTION PRÉVUE

What is Health Canada doing to protect young Canadians from the potential adverse effects associated with the use of *Salvia divinorum*?

- This Government is proposing to regulate *Salvia* as a controlled substance in order to protect the health and safety of Canadians, particularly youth.
- This Government has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate *Salvia* as a controlled substance.
- The regulation of *Salvia* would make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.
- This Government has also published an *It's Your Health* article warning the population about the risks associated with the use of this plant.
- This Government is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A.

### FINANCIAL INFORMATION (IF APPLICABLE) / INFORMATION FINANCIÈRE (SI APPLICABLE) : N/A

### BACKGROUND/CONTEXTE:

Media interest in *Salvia divinorum* is recurrent. Questions around this substance generally focus on its legality. Recently, a number of media reports have commented on a YouTube video which reportedly shows a young celebrity smoking *Salvia divinorum*. Canadian surveillance data indicates that this substance is being used by adolescents and young adults for its hallucinogenic properties, and there have been several reports from scientific sources indicating that *Salvia divinorum* has a potential for abuse.

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental

effects which are often described as unpleasant, including:  
hallucinations  
dysphoria (feeling anxious, depressed or restless)  
out-of-body experiences  
uncontrollable laughter  
loss of consciousness  
short-term memory loss  
lack of physical coordination  
slurred speech and awkward sentence patterns

Recent surveys indicate that Canadian youth are trying this substance which could be dangerous to their health. Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using Salvia divinorum at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of students grades 7-12 have used Salvia divinorum in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using Salvia divinorum and 4.4% of these students reported using this substance in the past year.

Current Situation in Canada

As Salvia divinorum is a plant with hallucinogenic properties when consumed by humans, it currently meets the definition of a natural health product (NHP) under the Natural Health Products Regulations. To date, Health Canada has not licensed for sale any natural health product which contains Salvia divinorum as an ingredient. The sale of unauthorized natural health products containing Salvia divinorum or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the Food and Drugs Act. Health Canada is proposing that S. divinorum and Salvinorin A be included in Schedule III to the CDSA. This would mean that the possession, trafficking, importation, exportation and production of Salvia divinorum and salvinorin A would be illegal unless authorized by regulation. The regulation of Salvia divinorum and Salvinorin A as controlled substances would allow law enforcement to take action against illegal activities involving this substance.

International Control of S. divinorum

Neither Salvia divinorum nor its main active ingredient salvinorin A are listed under the United Nations Drug Control Conventions; as a result, they do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions. The proposal to include Salvia divinorum and salvinorin A in Schedule III to the (CDSA) is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of Salvia divinorum and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

Certain websites also promote the use of *S. divinorum* as a "legal" alternative to street drugs.

Media interest in *Salvia divinorum* is ongoing, and questions around this substance generally focus on its legality.

Both the plant *S. divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects, including:

hallucinations  
dysphoria (feeling anxious, depressed or restless)  
out-of-body experiences  
uncontrollable laughter  
loss of consciousness  
short-term memory loss  
lack of physical coordination  
slurred speech and awkward sentence patterns

These effects are often described as unpleasant. Canadian surveillance data indicates that adolescents and young adults are using this plant for its hallucinogenic properties.

Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of students grades 7-12 have used *Salvia divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Current Situation in Canada

*Salvia* products being sold as hallucinogens are subject to the *Natural Health Products Regulations*, and the sale of unauthorized natural health products may be subject to compliance and enforcement actions under the *Food and Drugs Act*. The inclusion of *Salvia divinorum* and Salvinorin A in Schedule III to the CDSA would mean that the possession, trafficking, importation, exportation and production of these substances would be illegal unless authorized by regulation. This action would also allow law enforcement to take action against illegal activities involving this substance.

International Control of *S. divinorum*

The proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

Coverage Date February 22, 2011

### *Media and Comments Review*

Five articles appeared online on February 22<sup>nd</sup>. The CBC article generated the most comments at a count of 150.

Government moves to criminalize hallucinogenic salvia, CBC , 55 tweets, 129 comments,  
<http://www.cbc.ca/news/health/story/2011/02/21/man-salvia-glover-crime.html?ref=rss>

A sample of the 50 highest rated comments was reviewed. None of the comments support the ban on Salvia.

Comment with the highest "agreed" at 187 agree and 22 disagree:

*Health Canada knows very little about the long term effects. SO BAN IT, QUICK!! Don't bother studying it first. why is it that our masters always believe that if it feels good, then it must be bad. the exception being good old taxable liquor. good thing it never hurts anyone. those weeds and herbs though, ooh, ooh , better lock up anyone partaking is such evilness.*

Health Canada appeared 8 times in the comments. Only one was in support of the ban, one undecided and six were against the ban.

**Positive:** *And when it kills someone as a result of the adverse affects the same people advocating testing with no public warnings will be the first to cry how incompetant the Conservatives and Health Canada have been. Same old, damned if they do and damned if they don't.*

**Negative:** *If its not sold through a drug company so that government can make millions off it they want it against the law, sounds more like Health Canada protecting big drug companies once again.*

Alcohol or "booze" was mentioned in approximately 30 comments. Several commentators referenced how alcohol was harmful, yet it was legal. Some commentators were suggesting to treat Salvia like Alcohol and sell it in a controlled environment (like LCBO).

*I have never understood how such harmful things such as alcohol and tobacco are perfectly fine and legal for people to use and buy, while other much less harmful things that can be found growing naturally on this planet that can bring about 'out of body' experiences and altered states of reality are illegal?*

Government, Harper or Conservatives were mentioned in almost 50 of the comments. Comment examples:

*Police have long complained they're powerless to halt the sale of salvia, which has been known to produce some adverse reactions, including one case reported by Health Canada in 2006 in which an incoherent, suicidal teenage boy threatened to kill police officers." CBC This Article*

*I have to ask Health Canada how many times a week some drunk threatens to kill police officers but alcohol is still perfectly legal. One reported adverse salvia incident is hardly an epidemic. This is just one more Conservative measure to whittle*

*away at the freedom of Canadians. However, I fully expect Harper's usual gang of sycophants to jump on this bandwagon because it is getting tough on crime. What nonsense; it is getting tough on individual rights.*

Date: 2011-02-22 12:30 PM  
Subject: DUE COB WEDNESDAY, FEB. 23: Hot Issues Notes - Minister's Appearance on Supp C Estimates and Main Estimates 2011-12

Hi everyone,

The Minister has been invited to appear before the Standing Committee on Health (HESA) on Supplementary Estimates C and Main Estimates, scheduled for March 10th. Hot Issues Notes have been requested on a number of topics by ADMO. Please submit your notes to DGO by 3 p.m. tomorrow, Wednesday, February 23, 2011 in order to get the notes approved and sent to ADMO by the deadline.

Below you will find:

- a list of notes that CSTD has been asked to prepare
- where they exist, notes prepared for the Minister's appearance at Supps B last fall and recent ADM-approved QP notes to assist you
- a list of tips and reminders to help with your preparations

Please note that during this process we will also be making use of the permanent briefing binder notes (for the DM) that we've worked on last week.

The template for the Mains notes is the same as the one that was used for Supps B (attached below).

[attachment "hot issues notes - template hecs.doc" deleted by Patricia Rapold/HC-SC/GC/CA]

Since the Minister will have a longer period of time to respond to questions than in Question Period, Hot Issues Notes are not limited to 3 or 4 key bullet messages. Therefore, you are asked to prepare key

messages that will provide clear and sometimes detailed responses to questions. The recommended response portion of the Note could include up to 6 bullets. Please remember that as for QP Cards, the background should only include public-friendly factual information.

Please be sure to include bullets or background for financial/budget information, especially significant changes. For those of you preparing notes on sunseting programs, ADMO is waiting on approved wording from central agencies with respect to funding. ADMO will add the line to affected notes.

Please send the completed notes by February 23 at 3 p.m. to DGO. Where notes are being updated, please use track changes or red text and strike-out.

**ADVICE TO THE MINISTER**

Director  
Approved

SUBJECT / SUJET

**Salvia Divinorum**

**SYNOPSIS / SOMMAIRE**

On February 19, 2011, Health Canada published a Notice to Interested Parties proposing to include both *Salvia divinorum* and its main active ingredient salvinorin A in Schedule III to the Controlled Drugs and Substances Act (CDSA). This action is being taken in order to protect the health and safety of Canadians, particularly youth.

**ANTICIPATED QUESTION/QUESTION PRÉVUE**

What is Health Canada doing to protect young Canadians from the potential adverse effects associated with the use of *Salvia divinorum*?

- This Government is proposing to regulate *Salvia divinorum* and salvinorin A as controlled substances.
- This Government is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A. These effects include powerful hallucinations, confusion, disorientation and anxiety.
- This Government has published a *Notice to Interested Parties* in *Canada Gazette*, Part I, to give Canadians the opportunity to provide comments on its proposal to regulate salvia as a controlled substance.
- The regulation of salvia would make possession, trafficking, importation, exportation, and production illegal unless authorized by regulation.
- This Government has also published an *It's Your Health* article warning the population about the risks associated with the use of this plant.

**FINANCIAL INFORMATION (IF APPLICABLE) / INFORMATION FINANCIÈRE (SI APPLICABLE) :**  
N/A

**BACKGROUND/CONTEXTE:**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *Salvia divinorum* include: Sally D, Lady Sally, Maria pastora, diviner's sage, magic mint, and puff. Certain websites also promote the use of *Salvia divinorum* as a "legal" alternative to street drugs.

Media interest in *Salvia divinorum* is ongoing, and questions around this substance generally focus on its legality.

Both the plant *Salvia divinorum* and its main active ingredient salvinorin A are known to have physical and mental effects, including:  
hallucinations

dysphoria (feeling anxious, depressed or restless)  
out-of-body experiences  
uncontrollable laughter  
loss of consciousness  
short-term memory loss  
lack of physical coordination  
slurred speech and awkward sentence patterns

These effects are often described as unpleasant. Canadian surveillance data indicates that adolescents and young adults are using this plant for its hallucinogenic properties.

Results from the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the Canadian 2008-2009 Youth Smoking Survey also show that 5% of students grades 7-12 have used *Salvia divinorum* in the past year. The 2009 Ontario Student Drug Use and Health Survey (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

Current Situation in Canada

*Salvia* products being sold as hallucinogens for consumption by humans are subject to the *Natural Health Products Regulations*, and the sale of unauthorized natural health products may be subject to compliance and enforcement actions under the *Food and Drugs Act*. The inclusion of *Salvia divinorum* and Salvinorin A in Schedule III to the CDSA would mean that the possession, trafficking, importation, exportation and production of these substances would be illegal unless authorized by regulation. This action would also allow law enforcement to take action against illegal activities involving this substance.

International Control of *Salvia divinorum*

The proposal to regulate *Salvia divinorum* and salvinorin A as controlled substances is consistent with actions taken by several countries (e.g. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Some individual U.S. states have also implemented laws restricting their use, sale and/or distribution.

## DJ pleased with federal salvia proposals

By CBC News  
CBC News

*A Saskatoon disc jockey who tried to make a point by trying salvia on the air says Ottawa is on the right track clamping down on the hallucinogenic plant.*

A Saskatoon disc jockey who tried to make a point by trying salvia on the air says Ottawa is on the right track clamping down on the hallucinogenic plant.

"I would say that 99 per cent of people that are getting into it think it's going to be a fun, fun time," said DJ Ryder, who's with Mix 96.3. "And it's not."

Earlier this month, Health Canada posted notice of its intention to ban the potent herb and its active ingredient, salvinorin A. It is proposing to add both to the Controlled Drugs and Substances Act, making it illegal to produce, possess, traffic, import or export the substances.

Ryder said it's a good idea.

Last December, in a video that got more than 50,000 hits on YouTube, he was seen taking a puff of salvia while on the air.

What followed was several minutes of an alarmed and disoriented Ryder talking about the experience.

"I'm totally frigged up," he said at one point on the video.

Ryder said he did it to make the point that the drug is powerful, easily obtained and comes with side-effects more unpleasant than is generally known by the public.

He said he's happy the politicians are paying attention.

"We just wanted to make sure that they knew that a lot of young people were getting in over their heads with this," he said.

Other countries, including Australia, Belgium, Denmark, Finland, Germany, Italy, Spain and Sweden, have

CBC: DJ pleased with federal salvia proposals

already regulated or banned salvia, as have some dozen states in the U.S.

From: [REDACTED]  
To: OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca  
Date: 2011-02-22 05:05 PM  
Subject: Salvia divinorum and salvinorin A

Attention:  
CATHY A. SABISTON  
Director General  
Controlled Substances and  
Tobacco Directorate

This is in response to the Notice to interested parties — Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act.

My name is [REDACTED]

Currently at our shops we prohibit the sale of these products to anyone under 18. We are able to ensure the quality of the product and, most importantly, we are able to **fully educate** the interested customer regarding the substance's effect.

Salvia has no toxicity, and it is completely safe as long as the user is prepared for its effects. It has been widely available **in Canada since the early '80s and has been attributed to ZERO fatalities**. Like Alcohol or skydiving or many other potentially dangerous things, Salvia can be a pleasant and interesting experience as long as it is done responsibly.

I urge you instead to create a licensing program, similar to tobacco, where recognized retailers are licensed by Health Canada to carry the extract.

Ensuring that:

A) licensed retailers prohibit sales to minors under 18

B) quality and potency of extracts is consistent

C) packaging includes clear warnings regarding Salvia's effects. For example: "This package contains .25g of 18x Salvia Extract - **BE ADVISED**, when smoked, the onset is quick. **Sit in a comfortable place**. The effects will last for less than 15 minutes."

This is a much more reasonable and cost-effective way to mitigate any potential risk when using Salvia.

I understand the need to react to the public concern. It may seem easier to simply classify these products. But, let's be realistic, **scheduling it will not make it unavailable**. Like marijuana it will become an illicit, black market product, left to the hands of criminals to regulate and control. This solution would cause far more harm and cost millions of dollars to enforce. Scheduling Salvia will only stop me, a responsible, tax-paying retailer, from carrying Salvia. It will stop me from responsibly selling it to adults, who

will be informed how to use it in a safe environment.

I don't care about any financial loss that I would incur from the scheduling of this plant. The fact that its regulation will be left to criminals if scheduled is of grave importance and the utmost concern to me.

I am willing to pay more tax, or pay an annual fee for a licence, if that would allow me to carry this product. My shops would responsibly sell safe products to adults. Salvia quality and potency **could be regulated just like tobacco**. Save Canadian citizens from the violence and financial burden of adding more benign substances and plants to our already failed drug policy.

**Please feel free to contact me if I can be of any assistance at all.** I would be more than happy to help facilitate a responsible approach to regulating Salvia in manner that would both appease the legitimate concerns of the Canadian public and allow adults to use Salvia without criminal charges.

Thank you for your time, I hope to hear from you!

## *Salvia – Snapshot*

Presented by Public Environment Intelligence and Analysis, Health Canada  
Contact Caroline Quinn, Tel 613-960-6074, PEIA.AREP@hc-sc.gc.ca  
Coverage Date February 22, 2011

### *Media and Comments Review*

Five articles appeared online on February 22<sup>nd</sup>. The CBC article generated the most comments at a count of 150.

Government moves to criminalize hallucinogenic salvia, CBC , 55 tweets, 129 comments,  
<http://www.cbc.ca/news/health/story/2011/02/21/man-salvia-glover-crime.html?ref=rss>

---

A sample of the 50 highest rated comments was reviewed. None of the comments support the ban on Salvia. Comment with the highest "agreed" at 187 agree and 22 disagree:

*Health Canada knows very little about the long term effects. SO BAN IT, QUICK!! Don't bother studying it first. why is it that our masters always believe that if it feels good, then it must be bad. the exception being good old taxable liquor. good thing it never hurts anyone. those weeds and herbs though, ooh, ooh , better lock up anyone partaking is such evilness.*

Health Canada appeared 8 times in the comments. Only one was in support of the ban, one undecided and six were against the ban.

**Positive:** *And when it kills someone as a result of the adverse affects the same people advocating testing with no public warnings will be the first to cry how incompetant the Conservatives and Health Canada have been. Same old, damned if they do and damned if they don't.*

**Negative:** *If its not sold through a drug company so that government can make millions off it they want it against the law, sounds more like Health Canada protecting big drug companies once again.*

Alcohol or "booze" was mentioned in approximately 30 comments. Several commentators referenced how alcohol was harmful, yet it was legal. Some commentators were suggesting to treat Salvia like Alcohol and sell it in a controlled environment (like LCBO).

*I have never understood how such harmful things such as alcohol and tobacco are perfectly fine and legal for people to use and buy, while other much less harmful things that can be found growing naturally on this planet that can bring about 'out of body' experiences and altered states of reality are illegal?*

Government, Harper or Conservatives were mentioned in almost 50 of the comments. Comment examples:

*Police have long complained they're powerless to halt the sale of salvia, which has been known to produce some adverse reactions, including one case reported by Health Canada in 2006 in which an incoherent, suicidal teenage boy threatened to kill police officers." CBC This Article*

*I have to ask Health Canada how many times a week some drunk threatens to kill police officers but alcohol is still perfectly legal. One reported adverse salvia incident is hardly an epidemic. This is just one more Conservative measure to whittle away at the freedom of Canadians. However, I fully expect Harper's usual gang of sycophants to jump on this bandwagon because it is getting tough on crime. What nonsense; it is getting tough on individual rights.*

History: This message has been forwarded.

Good news on the standard acknowledgment. I will discuss with Brenda how she wants to be kept in the loop.....I don't see any value in sending up single letters just cause they are addressed to Cathy. I also know that ADMO has received a few directly to them and have suggested to Jesse that they send to us and we use the same acknowledgement for all. Consistency is important!

Brenda

I am attaching what we propose to send out in response to all the emails RPD has received in response to  
the NOI on salvia. It is consistent with emails we have used for the same purpose but in relation to other  
regulatory files, and is also akin to what we typically send in response to respondents who file comments  
during a prepublication comment period. As you will see, it is very generic and does not seek to respond  
to any particular issue(s) raised by the correspondent, and this is on purpose as it avoids us having to get  
into long defensive letters where we have to keep explaining our actions in acknowledging every set of  
comments received.

In conversation with Jesse yesterday, she mentioned that ADMO has already received a few letters re  
salvia directly, and she asked what our process was in terms of responding to them. If you are OK with

I am aware entering into MECS is a burden, so as long as we have the means to track who sent in what and what action we took, I am OK with not doing it. I would suggest some kind of table that Isabel can fill in and perhaps a numbering system for the hard copies where the number is noted in the table as well.

I am sure you can come up with something spectacular!

Pls send draft standard response out for translation....

Hi Jocelyn,

With regards to the comments we are receiving on the Salvia NOI, given the volume of comments and the fact that we are issuing a standard response, do the emails need to be entered in MECS?

FYI Isabel and I haven't found the BZP NOI comments in MECS (though there were only 5 of them), so I don't believe we entered them in 2008.

Thanks,

Stephanie

Cc: Alastair Sinclair, christine.roush, heidi.jackson, Jesse Arnup-Blondin,  
ken.polk, Stephanie Szick, Suzanne Desjardins

Dave,

Suzanne and I have discussed briefly and here is our proposed response.

**Where have we received complaints?**

CSTD has not heard any complaints. Rather it has received, as invited by the publication of the NOI, comments from some stakeholders suggesting that they are not supportive of the proposed regulatory action. It is completely normal for a department to receive both positive and negative comments further to an NOI.

**Why are alternatives (such as regulation like alcohol) the best course of action?**

It is entirely premature to suggest that any alternative to what the GoC has proposed, i.e., scheduling under the CDSA, is a better course of action. The notion that regulation like alcohol, e.g., the establishment of some kind of licensing scheme for retailers and perhaps an age limit in order to purchase, etc., are just ideas that have been put forward in comments received further to the publication of the NOI. It is common practice to wait until the end of the comment period before analyzing the incoming comments in full and determining whether examination of any alternatives to the proposed regulatory action is warranted.

Please let me know if you need anything else.

Jocelyn

Can I get answers to these two questions on salvia by 3 p.m?

-where have you heard complaints

- there were alternatives put forward by those who disagreed (such as  
regulating it like alcohol), why is this the best course of action

**Fw: URGENT: Need questions answered asap (re: salvia)**  
Suzanne Desjardins to: Jocelyn Kula

2011-02-24 03:02 PM

History: This message has been replied to.

Hi Jocelyn,

I think for the second point there could also be something like

"*Salvia divinorum* was assessed against the criteria for the addition of a substance to one of the Schedules to the CDSA to determine whether it should be regulated as a controlled substance in Canada. These criteria are:

- International Requirements and Trends in the Control and/or Scheduling
- Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA
- Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses
- Potential for Abuse and/or Addiction Liability
- Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally
- Risk to Personal and Public Health and Safety

Our preliminary assessment showed that Salvia met most, if not all, of these criteria, hence the NOI as a means to request comments and information before finalising the assessment.

What do you think?

→ NOT used; will keep until we have more questions

Suzanne

Subject: Fw: Salvia divinorum - Notice to Interested Parties / Avis d'intention aux parties intéressées

[le français suit]

Dear Sir/Madam:

The purpose of this email is to advise you that a *Notice of Intent to Interested Parties* (NOI) regarding the following substances was published in the *Canada Gazette*, Part I on February 19, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:

<http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf>, pages 8-9 in PDF format (pages 438-439 in *Canada Gazette*, Part I).

This NOI outlines Health Canada's proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulatory controls.

If you are interested in this process or wish to provide us with information for our consideration, please do so by March 21, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

PLEASE FORWARD THIS EMAIL TO OTHERS WHO MAY BE INTERESTED.

Should this notification have reached you in error, it would be appreciated if you could please forward it to the appropriate person in your organization and ask that person to inform us of this by sending an e-mail to: [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

Thank you,

Regulatory Policy Division  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate  
Healthy Environments and Consumer Safety Branch

\*\*\*\*\*  
\*\*\*\*\*

Madame, Monsieur,

Le présent courriel a pour but de vous informer qu'un *Avis d'intention aux parties intéressées* concernant les substances ci-dessous a été publié dans la Partie I de la *Gazette du Canada* , le 19 février 2011:

- *Salvia divinorum* (sauge des devins)
- Salvinorine A

La version électronique de l'Avis d'intention est disponible à l'adresse Internet <http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf> , pages 8-9 ,en format PDF (pages 438-439 dans la Partie I de la *Gazette du Canada* ).

Cet avis d'intention décrit la proposition de Santé Canada qui consiste à inclure la *Salvia divinorum* (sauge des devins) et la salvinorine A dans l'annexe III de la *Loi réglementant certaines drogues et autres substances* . Santé Canada cherche précisément à obtenir plus d'information de la part des intervenants afin de déterminer si ces substances ont une utilité légitime sur les plans industriel, scientifique ou médical au Canada. Les renseignements qui seront obtenus permettront de prendre des mesures réglementaires appropriées.

Si vous désirez participer à ce processus ou tout simplement nous fournir de l'information, veuillez communiquer avec nous d'ici le 21 mars 2011. Vous pouvez envoyer vos commentaires par la poste à Stephanie Chandler, Division de la politique réglementaire, Bureau des substances contrôlées, indice de l'adresse : 3503D, 123 rue Slater, Ottawa, Ontario, Canada K1A 1B9, par télécopieur, au 613-946-4224, ou par courriel à [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

VEUILLEZ TRANSFÉRER LE PRÉSENT COURRIEL AUX PERSONNES QUI  
POURRAIENT ÊTRE INTÉRESSÉES.

Si vous avez reçu cet avis par erreur, nous vous saurions gré de le transférer à la personne concernée de votre organisation et de lui demander de nous en informer par courriel à : [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca)

Merci.

## RPD Telephone Enquiry

**Date of Call:** February 25, 2011

**s.19(1)**

**Subject:** Publication of Salvia NOI

**Language of Correspondence:** English

**Caller Name:** [REDACTED]

**Caller Organization:** N/A

**Caller Telephone Number:** [REDACTED]

### CALL SUMMARY:

The caller wanted to confirm how long the comment period for the *Salvia divinorum* Notice to Interested Parties (NOI) was. I informed him that we are requesting all comments on the NOI be submitted by March 21, 2011. The caller also asked if after the 30-day comment period ended would *Salvia divinorum* be illegal. I told the caller that the publication of the NOI was meant to obtain comments on the initial proposal and that the scheduling of *Salvia divinorum* would have to go through the entire federal regulatory process which could take between 18 and 24 months. I also informed him that there would be additional opportunities for comment once a regulatory proposal is pre-published in *Canada Gazette*, Part I. The caller thanked me and indicated that he would be emailing us his comments.

Hi Isabel,

This is the standard reply approved by DGO for translation into French. Not a rush as we haven't received any French comments yet.

[attachment "Standard Reply to Salvia NOI Comments.wpd" deleted by Isabel Shanahan/HC-SC/GC/CA]

I've already started working on a table to track the comments. I know you have gotten a few phone calls already so I will probably add a table to track those as well.

**Réponse type aux commentaires reçus dans le cadre de l'avis aux parties intéressées  
concernant la Salvia**

Madame/Monsieur,

J'ai bien reçu votre courriel en réponse à l'*avis aux parties intéressées* qui a été publié au sujet de la proposition de Santé Canada d'inscrire la *Salvia divinorum* (sauge des devins) et la salvinorine A à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCIDAS).

Vos commentaires relativement à la proposition ont été fort appréciés et je peux vous assurer que nous en tiendrons compte dans le cadre du processus de réglementation fédéral. Vous aurez de nouveau l'occasion de transmettre vos commentaires lors de la publication préalable du projet de réglementation intégral dans la Partie I de la *Gazette du Canada*.

Vous trouverez dans le portail *Votre santé et vous* de Santé Canada un article concernant la *Salvia divinorum* visant à informer la population des risques associés à l'utilisation de cette plante. L'article peut être consulté à l'adresse suivante :  
<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-fra.php>

Je vous remercie de nous avoir écrit et vous prie d'agréer, Madame/Monsieur, l'expression de mes sentiments les meilleurs.

**Re: Fw: For input/approval: Interview request - CBC Calgary - Salvia** 

Stephanie Chandler Denis Arsenault

2011-02-28 11:57 AM

Hi Denis,

Q1 looks okay to me, and Q2 is for input from Suzanne's group.

For Q3), as the reporter is asking " what kind of ban?" I would suggest including the following line from the media lines:

The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

Q4) Is about Spice. I assume it is from the media lines, but may want to forward to Nathan to have a look at?

For Q5, I'm not sure what we want to say as far as other substances that we are looking to schedule. Your thoughts?

Regards,

Stephanie

**Subject:** For input/approval: Interview request - CBC Calgary - Salvia

Hi Jocelyn and Suzanne,

Below is a new CBC enquiry for your input and approval. Reporter is looking for an interview, however, we are going to provide written responses only. This is due COB so a response by 1:30 today would be greatly appreciated.

Suzanne - I believe Q2 is the only one you need to look at/approve.

Thanks!  
Nicole

\*\*\*\*\*

Salvia & Synthetic marijuana & other semi-legal highs (salvia his main interest)

**Q1) Are there 2 separate initiatives going on here? (Private members bill here and HC also looking at it - 30 day period for comments)?**

A1) After reviewing available information and reports that suggest *Salvia divinorum* and its main active ingredient salvinorin A have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances. The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete. Health

Health Canada is not aware of a private members bill regarding *Salvia divinorum*.

**Q2) Broad history over last 5 years - HC monitoring this? studying it? ban it? restrict it?**

A2) Health Canada has reviewed information and reports from a variety of sources regarding the use and dangers of salvia and has assessed its findings against several key factors involved in the determination of the scheduling of a substance, including

- its pharmacological similarity to other substances already regulated under the CDSA;
- its potential for abuse related to its hallucinogenic properties, and the fact that about 7% of youth 15-24 years of age have used it - this represents about 300,000 youth;
- the health risks associated with this substance as shown from some reports of adverse incidents, for example, an article in the *Journal of Emergency Medicine* in 2009 indicates that 39 adverse neurological, cardiovascular and gastrointestinal events associated with the use of salvia were reported to a statewide (California) poison control system over the span of a decade. Health Canada is also aware of a case reported in the U.S. in which a 17 year old boy committed suicide after smoking *S. divinorum* for an unknown period of time, and although a direct causal link between salvia use and the death cannot be firmly established, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

In addition, in one case report, published in the *Journal of Clinical Psychiatry* in 2008, a woman who had concomitantly consumed cannabis and salvia *divinorum* experienced severe psychotic symptoms (symptomatic toxic psychosis) along with emerging and life-threatening medical consequences. In 2006, there was also an incident in Canada in which an incoherent suicidal teenager threatened to kill police officers after apparently consuming salvia.

Health Canada is continuing to survey the prevalence of salvia use and in 2009, Health Canada started including questions on salvia use in both the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey. The Centre for Addiction and Mental Health in Toronto similarly included questions on salvia use in the Ontario Student Drug Use and Health Survey. As results from these

surveys became available in 2009-2010, the Department was able to include Canadian surveillance data in its ongoing assessment of salvia.

**Q3) Current initiative - what is behind this? Why is HC looking to ban it? What kind of ban? Reasons behind it?**

A3) See A2.

Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q4) Also - issue of synthetic marijuana - "legal" highs K2 / spice / Yucatan fire / Skunk - what is HC's position on these?**

A4) There is no such thing as synthetic marijuana as marijuana (cannabis) is a plant that is also a controlled substance. Health Canada is aware that there are products being sold in Canada that contain synthetic cannabinoids, the family of molecules that give marijuana its psychoactive properties. It is, however, illegal to sell, import, produce, export or possess any product that contains synthetic cannabinoids as these compounds are captured under Item I of Schedule II to the Controlled Drugs and Substances Act (CDSA). Any offences of this nature are subject to criminal prosecution in Canada. Law enforcement can take action if they suspect illegal activity. In Canada, these synthetic cannabinoids are considered to be similar synthetic preparations of cannabis, and thus are subject to the *Controlled Drugs and Substances Act*

While products sold under the brand names "Spice" and "K2" are marketed as herbal incense for use in the home, it is believed that these products are generally smoked by consumers because they are known to produce effects similar to those induced by marijuana. It is believed, that the cannabis-like effects of these products come from the infusion of one or more synthetic cannabinoids and analysis of some "Spice" products being sold in Canada has shown that these products contain the synthetic cannabinoids JWH-018 and CP-47497. These substances are considered to be similar synthetic preparations of cannabis, which are listed in Item 1 of Schedule II of the *Controlled Drugs and Substances Act* (CDSA).

It is illegal to sell, import, produce, export or possess products that contain these controlled substances in Canada, and offences of this nature are subject to criminal prosecution in Canada. When identified as such, illegal herbal incense products will be seized at points of entry into Canada and removed from retail outlets. Law enforcement can take action if they suspect illegal activity.

**Q5) Any other similar drugs Canada is looking at banning as well?**

A5) For OCS input.

Carol Sabiston  
Director General  
Controlled Substances and Tobacco Directorate  
Health Canada

Re: Proposed addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

Monday, February 28th 2011

Dear Ms. Sabiston,

I am writing to express my concern with the proposed addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act (1). The Government

has not demonstrated that any significant harm comes from smoking or ingesting *Salvia divinorum* and salvinorin A. Reading through the proposal, the only detriment that can be determined is that the effects may be "unpleasant". Health Canada should ask itself if protecting Canadians from unpleasant experiences is part of its mandate, or if the personal decisions that arise from one's conscience are not enshrined in the Canadian Charter of Rights and Freedoms. There is no published evidence that demonstrates addiction or harm from ingesting *S. divinorum* or salvinorin A. The proposal claims that *Salvia* is a hallucinogen similar to LSD, and offers this as a reason why it should be regulated, but research suggests that the effects of *S. divinorum* or salvinorin A are not the same as LSD and cannot be placed in the same category (2, 3). The proposal cites statistics published in the Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) claiming that up to 7.3% of young Canadians between the ages of 15-24 have used *S. divinorum* or salvinorin A at least once in their lifetime, but over all, demonstrates a very low use among Canadians in general (0.5%) (4). Despite the fact that *S. divinorum* or salvinorin A are currently unscheduled, the rates of use (and hence abuse) among young people are lower than for either *Cannabis* (10.6%) and alcohol (75.5%), two substances that are otherwise illegal or restricted to youth (5). Very clearly, creating legal impediments to recreational use has not effectively diminished the consumption of either marijuana or alcohol, and my concern is that once *S. divinorum* and salvinorin A are placed in Schedule III and hence become restricted substances they will acquire greater notoriety among youth, and more importantly, will be distributed by criminal elements, putting our youth at greater risk not just from criminal activity but from adulteration. If it were Health Canada's intent to remove all substances that youth consume recreationally, then perhaps Health Canada might consider banning petroleum distillates and solvents, since this represents a greater danger, with upwards of 5% of Canadian youth at risk from inhalant abuse (6). Compared to the "unpleasant" effects of *Salvia divinorum* or salvinorin A, inhalation of petroleum distillates and solvents leads to very real medical and health issues, and yet these substances remain widely available with restriction. Based on the balance of evidence I strongly urge Health Canada to withdraw this proposal and focus its energies on more meaningful enterprises including education and harm-reduction. If we expect youth to be responsible and mindful about their recreational choices then let's avoid these sorts of paternalistic, heavy-handed measures to criminalize personal choices. Let us create an informed and intelligent society.

Competing Interests: None declared.

Yours sincerely, [REDACTED]

Hi,

A couple of follow-up questions to my previous email:

- 1) While it appears we now have to include these comments/responses in MECS, do you think a physical docket is necessary for each of these?
- 2) One of the comments we received cc'd Jack Layton, Michael Ignatieff and other political figures. Do you think we should simply cc them in our response?

Denis

Subject: Salvia NOI Comments

Hi Jocelyn,

Just confirmed with Stephanie that we have received thus far 36 comments in response to the NOI. No responses to these have been sent thus far.

For now, Isabel will create MECS dockets as needed and Stephanie will coordinate with her to send responses and ensure these are also included in MECS.

Some of these comments are pressing as they ask for specific info (i.e. when does the comment period close?)

Subject: LTE - Winnipeg Free Press

not sure if it was picked up in the press clippings on Friday, but I found  
it on the paper's web site. It appears they took MP Glover's name off.  
I've included another letter on the same subject, that apparently didn't  
require the same # of approvals ;)

Letters to the Editor

Winnipeg Free Press - PRINT EDITION

Have your say

By: Staff Writer

Posted: 02/25/2011 1:00 AM | Comments: 6

· Powerful hallucinogen  
· We would like to respond to the Feb. 23 editorial No need to ban  
salvia on the Government of Canada's recent proposal to control salvia  
divinorum and salvinorin A.

· We want to eliminate the misconception that salvia is a safer  
alternative to street drugs.  
It is not.

Salvia divinorum, and its active ingredient salvinorin A, can produce  
powerful hallucinations similar to those associated with the use of the  
well-known hallucinogen LSD, which is a controlled substance. Other  
effects include confusion, disorientation and anxiety.  
In Canada, about seven per cent of youth aged 15 to 24 have tried salvia.  
This represents about 300,000 young people -- a rate that is similar to  
that for cocaine and ecstasy, and a rate much higher than that for LSD.  
The move to control these substances is also consistent with actions taken  
by several other countries, such as Australia, Belgium, Denmark, Finland,  
Germany, Italy, Japan, Norway, South Korea, Spain and Sweden. All have  
placed similar controls on the import and/or sale of salvia divinorum  
and/or salvinorin A. Some U.S. states have taken action to restrict their  
use, sale and/or distribution.

003012

Minister of Health  
Ottawa  
\*\*\*\*\*

Your Feb. 22 article Feds eye ban on obscure herb indicates a dangerous disconnect with reality and perception. Bart Stras, owner of the head shop The Joint, clearly has been smoking too much of his own product when he says "salvia has never had any issues as a herbal incense product." Of course it hasn't, because he knows that people who buy salvia want a hallucinogenic high and aren't looking to have their boudoir smell minty fresh. If it weren't so pathetic, it would be almost comical that salvia is sold as a so-called natural health product. I believe that poisonous mushrooms are also a 100 per cent natural product.

Subject: Salvia NOI Comments

---

Hi Jocelyn,

Just confirmed with Stephanie that we have received thus far 36 comments in response to the NOI. No responses to these have been sent thus far.

For now, Isabel will create MECS dockets as needed and Stephanie will coordinate with her to send responses and ensure these are also included in MECS.

Some of these comments are pressing as they ask for specific info (i.e. when does the comment period close?)

Denis

**Re: Question about Salvia IAS**   
Stephanie Chandler to: Hanan Abramovici

2011-03-02 12:11 PM

Hi Hanan,

Here is the most recent draft of the IAS, however, keep in mind that it has not been approved by the Director, OCS as it will have to be updated again once I have collected all the comments on the NOI.

Draft Salvia Divinorum IAS\_Jan 6 2011.doc

May I ask what you mean by scheduling decision...? Is Salvia going back to the CSS-WG?

Thanks,

Stephanie

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum* (*S. divinorum*) under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by youth specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

1

### 3. PURPOSE

To assess *S. divinorum* against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether this substance should be regulated as a controlled substance in Canada.

### 4. CONTEXT

*S. divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extracts and plant cuttings. Also called "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* is a neoclerodane diterpene which is found primarily in the leaves, and to a lesser extent in the stem of the plant.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc. *S. divinorum* cuttings are also available from a number of garden supply companies.

*S. divinorum* is a substance not currently scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not sold as a health product or marketed as a hallucinogen. In addition, the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS) in November 2005, which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November

2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification set out in the Health Products and Food Branch Inspectorate (HBFBI) Recall Policy. Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Deleted: of the Recall Policy of the

Further to a discussion with the Assistant Deputy Minister (ADM) of the Healthy Environments and Consumer Safety Branch (HECSB) in April 2007, the (then) Drug Strategy and Controlled Substances Directorate (DSCSD) (now the Controlled Substances and Tobacco Directorate, CSTD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHPD, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* should be prepared.

Deleted: w

#### 4.1 Relevant Legislative Frameworks in Canada

##### 4.1.1 Food and Drug Regulations (under the Food and Drugs Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that their product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or

- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of October 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### 4.1.2 Natural Health Products Regulations (under the Food and Drugs Act)

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, a Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada. A product licence may be obtained pursuant to an application in which the applicant attests to all of the conditions set out in a natural health product monograph prepared and published by the Natural Health Products Directorate. Alternatively, an applicant may submit a product license application that provides evidence of quality, safety and efficacy that is assessed as being sufficient and approved by NHPD by the full submission route. The NHPR also require that all manufacturers, packagers, labelers, and importers have a site license issued on the basis of sufficient evidence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and all other aspects of Good Manufacturing Practices as set out in the NHPR.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to the requirement that all of the medicinal ingredients of an NHP must be substances set out in Schedule 1 (a list of included substances) to the NHPR, a traditional medicine or a homeopathic medicine, and none of the ingredients can be substances set out in Schedule 2, a list of excluded substances which includes any substance listed on Schedules I to V of the CDSA. Section 2(2) of the NHPR excludes those substances (except homeopathic medicines) whose sale is required to be pursuant to a prescription as per Section C.01.043 of the F&DR.

As per section 93(1)(b)(vi) of the NHPR, every natural health product must be labeled with its

authorized recommended use or purpose. Products that contain *S. divinorum* and that are manufactured, sold or represented for use as a hallucinogen meet the definition of an NHP.

Health Canada has not authorized for sale any natural health products containing *S. divinorum* or salvinorin A as an ingredient. Therefore, sales of *S. divinorum* are illegal under the NHPR if the product is represented for use as a hallucinogen or if other health claims are made.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into six Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule to the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control and/or scheduling;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, or industrial uses;
- Potential for abuse and/or addiction liability;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

#### 4.2 Assessment of *S. Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in Control and/or Scheduling

At the present time, neither *S. divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

##### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's *Standard for the Uniform Scheduling of Drugs and Poisons* on the basis of "high

**Deleted:** eight

**Deleted:** f

potential for abuse and risk to public health and safety.”<sup>3</sup> Schedule 9 is Australia’s most restrictive drug schedule, and includes “substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities.”<sup>4</sup>

### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

Comment [S1]: Spelling OK

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several other substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

Deleted: s

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella I*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

### **Spain**

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

It is illegal to possess or sell *S. divinorum* in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*. Although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern", this has no legal implications. According to the National Institute for Drug Abuse, the Drug Enforcement Administration is considering classifying *S. divinorum* and/or salvinorin A as Schedule I drugs. This Schedule includes substances such as LSD and marihuana.

At the state level, a number of state legislatures have implemented laws restricting the use, sale and/or distribution of *S. divinorum* and/or salvinorin A, including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. By way of example, additional details regarding the regulation of *S. divinorum* in these last five states are provided below.

Deleted: some

Deleted: .

Deleted: As of July 2010, a number of states have placed regulatory controls on *S. divinorum* and/or salvinorin A including

#### **California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, a fine of no more than \$1,000, or both.

#### **Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S.*

*divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *S. divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when (and if) it is recognized by the Food and Drug Administration as a homeopathic drug.

#### **4.2.2 Chemical and/or Pharmacological Similarity to Substances Listed in the Schedules to the CDSA**

The psychoactive ingredient in *S. divinorum* is the neoclerodane diterpene salvinorin A.<sup>6</sup> As a diterpene, salvinorin A is part of a family of substances that contain terpenoids. Another plant which contains psychotropic terpenoids is *Artemisia absinthium* (wormwood).<sup>7</sup> Salvinorin A is a hallucinogen with a distinct structure and it does not interact with the serotonin type-2A receptor or any other molecular target of classical hallucinogens.<sup>8</sup> Instead, the available research suggests that the psychotropic effects of salvinorin A are mediated by its agonistic actions at the  $\kappa$ -opioid (KOR) receptor.<sup>9</sup> Its mechanism of action is therefore unique.<sup>10</sup>

<sup>6</sup> Prisinzano TE. Psychopharmacology of the hallucinogenic sage *Salvia divinorum*. *Life Sci.* 2005 Dec 22;78(5):527-31.

<sup>7</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy.* 2006 Sep;26(9):1268-72.

<sup>9</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A.* 2002 Sep 3;99(18):11934-9.

The psychoactive effects of *S. divinorum* vary in onset and duration and include perceptual distortions such as the sensation of becoming an object, having visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>11</sup> Laughter, happiness, a sense of well-being and dissociative effects were deemed the most positive aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>12</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>13</sup>

The psychotomimetic effects of *S. divinorum* closely resemble the schizoid symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only a weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine.<sup>16</sup> Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>17</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience are quite unique.<sup>18</sup>

*S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, and the increased de-realization is not commonly reported for classical psychedelics.<sup>19</sup> The combination

of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>20</sup>

The onset and intensity of the effects of *S. divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>21</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. inhalation, intravenous, intramuscular and sublingual use) provide the quickest and most intense effect.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The effects felt from vaporizing salvinorin A are experienced in about 30 seconds, last for about 5-10 minutes, and then subside over the next 30 minutes.<sup>23</sup>

Smoking the dried leaves or a concentrated extract using a pipe or bong is by far the most popular method of administration.<sup>24</sup> Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because they are insoluble in water.<sup>25</sup>

Deleted: powder is

#### 4.2.3 Legitimate Use of the Substance (Therapeutic, Scientific, Industrial)

*S. divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico.<sup>26</sup> For medicinal purposes (gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach) an infusion of the leaves or the leaves themselves are ingested.<sup>27</sup> However, its main use in Mexico today is believed to be for its

<sup>27</sup> Munro, T. *The Chemistry of Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

psychedelic properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>28</sup>

Although selective KOR agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>29</sup> In addition, while it has been speculated that KOR agonists may be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder, there has been no clinical research to support these hypotheses.<sup>30</sup> There are presently no recognized medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial or commercial uses for *S. divinorum* in Canada. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for "recreational" purposes, rather than out of horticultural interest or for its esthetic appeal. However, it should be acknowledged that this does not preclude the possibility of a person growing this plant for purely decorative purposes. *S. divinorum* is also marketed as incense. However, there is no evidence that *S. divinorum* has any fragrant properties that would legitimize such a use. Therefore it is believed that the marketing of this plant as an incense is a means to avoid compliance and enforcement actions by Health Canada.

#### 4.2.4 Potential for Abuse and/or Addiction Liability

Salvinorin A is a potent, KOR-selective agonist and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists such as morphine, KOR agonists are negatively reinforcing and aversive.<sup>31</sup> In addition, KOR agonists have analgesic properties, but are not associated with respiratory depression like MOR agonists.<sup>32</sup> Finally, while MOR agonists increase the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>33</sup> In the case of MOR agonists, the increase of dopamine acts as a positive reinforcer. This action motivates the user to use the drug again, which could lead to drug abuse and/or addiction. For KOR agonists, this is not the case.

<sup>32</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman's The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

<sup>33</sup> Gustein HB & Akil H. Opioid Analgesics. In: *Goodman and Gilman's The Pharmacological Basis of Therapeutics* 11th Ed. Brunton LL, Lazo JS and Parker KL (editors). McGraw-Hill, New York, USA, 2006, pp. 547-590.

The aversive effects of KOR agonists suggest that the risk of addiction to *S. divinorum* is negligible. Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety),<sup>34</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>35</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>36</sup> Despite these reports, very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* on humans have been carried out and the results have been conflicting. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>37</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>38</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>39</sup>

In addition, some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>40</sup> Therefore, it is difficult to predict with certainty its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Further studies in this area and on the KOR mediated decrease of dopamine are also required in order to fully understand the addiction potential of this substance.

While concerns for the potential of abuse were initially considered minimal given that 1 kg of dried leaves only yields 3 to 6 human doses of salvinorin A for oral consumption, it was then discovered that vaporizing and inhaling 200-500 micrograms has profound hallucinogenic

effects.<sup>41</sup> Given that only small doses of this substance are necessary to achieve the desired effects through inhalation, the potential for abuse is much higher. Also, the extraction of salvinorin A from the plant is simple, and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. This is enough for 2000 oral doses.<sup>42</sup>

Deleted: now

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the prevalence of use of *S. divinorum* has recently been documented. Questions about the use of salvia were included in the 2009 Ontario Student Drug Use and Health Survey, the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey.\*

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *S. divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *S. divinorum*;
- There is significant grade variation, with *S. divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and

Deleted: s.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used salvia in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used salvia in the last twelve months; and
- Males (6.6%) were more likely to have used salvia in the past twelve months compared to females (3.2%).

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>42</sup> Valdés LJ 3rd. Salvia divinorum and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

\* It should be noted that in some cases it is not clear if responses indicate the use of *S. divinorum* or salvinorin A given the use of the term "salvia" within the survey question.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%, while 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% ecstasy and 0.7% illicit hallucinogens. In conclusion, 'salvia' appears to be a substance that is tried largely by youth with a 7.3% prevalence of lifetime use.

According to the 2009 Monitoring the Future survey, the annual prevalence of use of *S. divinorum* among 12th graders in the United States is 5.7%. The American Substance Abuse and Mental Health Services Administration's 2006 National Survey on Drug Use and Health found that, of respondents aged 12 or older, 1.8 million had used *S. divinorum* at least once in their lifetime and 756,000 had used the substance in the past year. Among youth aged 12 to 17, males were more likely than females to have used *S. divinorum* in the past year (0.9% vs. 0.3%).

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of samples seized by law enforcement, ranging from 9 samples in 2006 to 20 samples in 2009. It is, however, difficult to determine how this data reflects the extent of actual abuse of salvinorin A in Canada, given that it is not an illegal substance and would likely only have been seized accidentally or during the seizure of other controlled substances.

Between 2003 and 2009, the Border Integrity Unit of the Health Products and Food Branch Inspectorate (HPFBI) reported a total of 26 (23 refused, 3 released) records of imports and attempted imports of *S. divinorum* products. These records represent British Columbia and Ontario only however, and data for other provinces is not available. However, the practice of recording imports has since been replaced by a national database in which only refused shipments are tracked. As of November 2010, there is no record of a refused shipment of *S. divinorum* in the national database. This may reflect decreased volume of incoming shipments, decreased referral of such shipments by Canada Border Services Agency (CBSA), or adaptation by importers/sellers to import requirements (e.g. labelling as incense).

Deleted: that  
Deleted: alvia  
Deleted: in their databases  
Deleted: . D  
Deleted: alvia

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States are Drug Enforcement Administration (DEA) databases that collect scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. While in 2000 no seized samples were found to contain *S. divinorum* or salvinorin A, 70 samples tested positive in 2008. Once again, it is difficult to determine how this data can be used to reflect the actual extent of abuse of *S. divinorum* and salvinorin A in the United States as neither substance is listed in the *Controlled Substances Act*.

The increase in both the number of enquiries to Health Canada from various municipalities and members of the public and the amount of media interest regarding the availability of *S. divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise. However, it may also reflect an increased awareness of the phenomenon, rather than an increased incidence of use.

#### 4.2.6 Risk to Personal and Public Health and Safety

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. As this substance is typically smoked, there is no risk of infectious disease transmission as is the case when a drug is injected. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>43</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>44</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum*. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding physiological and psychotropic effects of *S. divinorum* use have been published in the scientific/medical literature. For example, an international case report described the perceptions of a 19 year-old man after inhaling *S. divinorum* smoke. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>45</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *S. divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>46</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>47</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006), showed that the salvinorin A content in five

<sup>43</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).<sup>48</sup>

There are also several reports of domestic adverse reactions related to the use of *S. divinorum* that have been received through the Canada Vigilance database. However, this does not reflect true incidence due to under-reporting.

s.21(1)(b)

## 7. CONSIDERATIONS

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the marketing of the product indicates that it is to be sold for human consumption in order to modify an organic function. Moreover, while the sale of unauthorized natural health products containing *S. divinorum* or its active ingredient salvinorin A may be subject to such actions by Health Canada under the *Food and Drugs Act* (FDA), the penalties applicable to incidences of unauthorized sale under the FDA are very low and would likely not deter a retailer from continuing to market unauthorized products. Unlicensed natural health products are also permitted to be imported provided they are for personal use only.

Field Code Changed

Non-regulatory options for the control of *S. divinorum*, such as the development of an educational campaign to highlight the risks associated with using this plant, were also considered. However, the risks associated with this substance, as well as the confusion concerning its enforcement as a natural health product only when it is sold for use with a health claim, do not make this option viable.

*S. divinorum* meets the criteria for scheduling a substance under the CDSA. While neither the plant nor its main active component salvinorin A are scheduled under any of the UN Drug Control Conventions, a number of countries and American states have taken steps to control the distribution and use of these substances. *S. divinorum* and salvinorin A are pharmacologically similar to other substances included in Schedule III to the CDSA, such as LSD and psilocybin. There are also currently no legitimate therapeutic, commercial or industrial uses for *S. divinorum*.

While the addiction potential of *S. divinorum* appears to be low, there is a significant potential for its abuse as a 'legal' hallucinogen. There is very little information with regards to the long-term effects of *S. divinorum* use. There is also evidence of use, particularly by Canadian youth and potential for individual health risks as well as risks to public health and safety.

In light of a recommendation to include *S. divinorum* under Schedule III to the CDSA, it is also recommended that the main psychoactive ingredient of this plant, salvinorin A, be scheduled. Salvinorin A can easily be extracted from *S. divinorum* and this substance gives the plant its hallucinogenic properties. Therefore the use of salvinorin A poses the same risks as *S. divinorum* and should also be controlled under the CDSA in the same manner as *S. divinorum*.

## 8. RECOMMENDATIONS

s.21(1)(a)  
s.21(1)(b)

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that *S. divinorum* is readily available and law enforcement agencies have no legal means to prevent its sale.

OCS has received a number of correspondences from Canada Border Services Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. At present, only shipments of *S. divinorum* that are represented for sale as health products that modify organic functions can be refused for import under the NHPR.

**Deleted:** CBSA officers have also expressed concern regarding the plant's hallucinogenic properties.

OCS brought *S. divinorum* to the Controlled Substances Scheduling Working Group (CSS-WG) in August 2010 to discuss the possibility of regulatory control of this substance. After assessing the available information against the six criteria listed in the Context section of this Issue

Analysis Summary, the CSS-WG recommended that *S. divinorum* be added to Schedule III to the CDSA.

**RPD Telephone Enquiry**

**Date of Call:** March 3, 2011

**Subject:** Publication of Salvia NOI

**Language of Correspondence:** English

**Caller Name:** [REDACTED]

**Caller Organization:** [REDACTED]

**Caller Telephone Number:** [REDACTED]

**CALL SUMMARY:**

[REDACTED] had a number of questions with regards to the publication of the *Salvia divinorum* Notice to Interested Parties (NOI). He first wished to confirm the final date to submit comments, which I informed him was March 21, 2011. He also wanted to know how he could go about submitting comments, and I informed him that he could submit comments by mail, email or fax. [REDACTED] also asked if Health Canada was currently looking at scheduling any other plants similar to *S. divinorum*. I told him that while I was not in a position to answer that question, if we were to look at the scheduling of a plant it would undergo a separate scheduling assessment separate from *S. divinorum*. [REDACTED] also indicated that he had sent an email to the OCS PRAD email account, and I informed him that he would receive an acknowledgement shortly. The caller then asked me whether making all activities with *S. divinorum* illegal or not scheduling *S. divinorum* were the only two options Health Canada could possibly move forward with. I told him that after a review of the comments received from the NOI, Health Canada could potentially consider other regulatory options or schedules for the plant. He also wanted to know when *S. divinorum* would be considered illegal. I informed him that a regulatory process typically takes 18 to 24 months to complete. [REDACTED] thanked me for returning his call and indicated that he would be submitting comments on the NOI.

Am unclear what you mean by "removing the Feb 4 date" as that is unfortunately how all NOIs are published, and we would have to go through departmental approvals to republish an NOI without that date, ie. the content of the doc is not in our hands, it is with the Gazette Office.

In this regard, I think asking the outlets to issue a correction would be better. Or we just suck it up and move on. I personally, don't think the date is what is influencing people whether to write or not!

Hi Jocelyn,

As the email trail below seems to specifically address the ministerial dockets, I would just like to confirm that RPD is cleared to go ahead sending the standard response (with Jesse's revision) to the emails that have been received to the OCS PRAD account.

I have also received a phone call from [REDACTED]  
According to his voicemail he just had general questions regarding the NOI process. I will return his call this afternoon unless you have any concerns?

Thanks,

Stephanie

Hi Jocelyn -

Sorry about the delay in getting back to you. I haven't been able to get a response from ECD on this yet, so in the interest of getting these dockets done on time, send them up with the response you have drafted, and I will keep working to see if we can get future dockets replied to with a standard so we don't need to send them to the directorate.

The one change I would suggest is to change the "when" to a "should" for publication in CGI, since we don't want to draw the conclusion prematurely that the Minister will approve proposed regs.

There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette* , Part I.

Will keep you posted on path forward for future dockets.

Hi Jesse

Just wondering if there was any decision as to whether our proposed standard response to comments received in response to the NOI and/or any ministerial or departmental correspondence. Just that we have three ministerial dockets now in hand, and obviously, we would like to respond in time.

If memory serves, you were going to check with ECD re. whether we could "get out of" including more substantive text regarding why the Dept has taken the action it has, which as I pointed out, is only going to irritate the drug decriminalization advocates that have been writing to us.....

Happy to discuss further as needed.

**Salvia Divinorum**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs 2011-02-19 07:30 AM

Hello,

I'd like to comment on the proposal to ban salvia divinorum.

There is no evidence whatsoever that salvia divinorum causes dependence or other negative long-term health effects. Compared to alcohol and tobacco, salvia is practically harmless. While some people may describe the effects as "unpleasant", others have found it to be useful for meditation and relaxation. The herb is used by indigenous tribes in Central America for the latter purposes.

I strongly believe that it should not be the place of the government to tell people what they can and can't ingest, without strong evidence that a substance is dangerous. It seems to me that salvia is being banned primarily due to prejudice, as the media often associates it with drugs like LSD, even though it is a vastly different drug. I think that for the government to restrict the freedom of its citizens in such an arbitrary manner is disgusting.

The proposal cites protecting teenagers as one of the primary reasons for this ban. However, there is no reason given as to why teenagers need to be protected from it. "Protecting children" these days seems to be more of a euphemism for infringing on freedom, rather than an actual reason. Furthermore, teenagers are already using alcohol, tobacco, marijuana, and many other much more harmful drugs, regardless of the legality. The drug war has done nothing to protect children from drugs (and some even argue it has made it worse). This ban would simply be a step further in the wrong direction.

Please respect the freedom of responsible adults and do not ban this substance.

Thank you

**Proposed Regulation of Salvia Divinorum**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-19 11:53 AM

Firstly, thank you for the opportunity to comment on the proposed addition of salvia divinorum to Schedule III of the CDSA. It is certainly important, and appropriate, to invite consultation before making such profound decisions.

Secondly, I would like to request information about any and all scientific studies regarding the health impacts (detrimental or positive) of consumption of salvia divinorum. I see your notice in *Canada Gazette* mentions the number of people who report using it, however what I don't see is

**s.19(1)**

any scientifically based studies guiding Health Canada's decision-making on this issue. To my knowledge, salvia divinorum is not physically addictive, is short acting (in the neighbourhood of five minutes), poses no danger of death via overdose (as far as I'm aware, no known alkaloid hallucinogenic can cause death directly, except perhaps ibogaine (although reports regarding ibogaine's toxicity are somewhat dubious also)) and has not been clinically shown to cause any adverse health effects.

Altering one's perception of reality is rather fundamental to the human experience - this is, after all, why amusement parks are in business, and why children enjoy swings and merry-go-rounds and seesaws while adults enjoy alcohol and 3D movies. Other than a general bias against particular **methods** of altering one's reality, is there any **science** backing up this proposal?

I look forward to hearing from you.

Cc: inspire

**s.19(1)**

Dear Stephanie,

I was perturbed this morning to read that Health Canada is proposing the addition of Salvia divinorum and salvinorin A to the Controlled Drugs and Substances Act. To add context, I have never used nor do I intend to use this substance. My concerns with this change include the following:

- This change would likely affect individuals who choose to use this substance for self exploration, expansion of spiritual growth. I, and many other Canadians, believe that this is a legitimate use of psychotropic substances. It is a right to inhibit peoples' choice to expand their awareness.
- Prohibition of salvia would shift profits from legitimate, tax-paying enterprises to organized criminals. Profits would certainly increase with prohibition, expanding a criminal underworld that is strongly resented and feared. Increased enforcement and punishment, as has been demonstrated clearly by the US model of drug prohibition while doing nothing to limit access to salvia. The health impact (mental health, HIV, etc.) of increased prison is a negative impact of salvia's continued status as a legal substance.
- There is no evidence that salvia is addictive.
- There is no evidence supporting a conclusion that salvia use, in and of itself, is harmful to human health.

Health Canada's role in this matter should involve educating Canadians on the known effects and responsible use of salvia. Sales of salvia to irresponsible minors should also be considered. Further expansion of a policy of prohibition without a fact-based understanding of substance abuse, damage prevention, and economics. I urge you to consider these issues in your policy on the regulation of salvia divinorum and salvinorin A.

Sincere regards,

s.19(1)

In regards to the proposed Salvia divinorum ban...

2011-02-19 03:39:49 PM

Comments on the proposed addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

to: OCS.Policy.and.Regulatory.Affairs

2011-02-19 03:39 PM

In regards to the proposed Salvia divinorum ban,

s.19(1)

It always make me laugh, the hypocrisy of drug laws. Salvia is indeed a very powerful drug. However, it is not habit-forming, it is non-toxic, and most people only try it once or twice as a novelty. It is not pleasurable, but rather intensely hallucinogenic and disorienting. On a scale of relative harm, salvia would be lower than coffee, and alcohol and cigarettes would be at the top.

When the government goes out of its way to ban a harmless plant, when alcohol and cigarettes, or even energy drinks, are legal, it destroys their credibility. Regulation is fine, but banning salvia will only make the government look like a foolish old nanny. Prohibition has never worked, and it won't work for salvia either. I would further argue that it is none of the governments business to tell me, an educated consenting adult, what plants I may consume, when there is no evidence of toxicity or harm.

Furthermore, your department should be focusing it's efforts, and my tax dollars, on actual dangerous drugs that are unregulated, such as MDPV, mephedrone, synthetic cannabinoids, etc. These substances are both addictive and potentially harmful, unlike salvia.

Sincerely,

s.19(1)

**Salvia Divinorum Ban is very concerning**

[redacted] to: OCS.Policy.and.Regulatory.Affairs 2011-02-19 04:45 PM

Please respond to [redacted]

Hello,

I am very concerned the proposed ban on Salvia Divinorum will do more harm than good, as well

**s.19(1)**

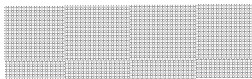

as take away the choice of adults.

I can certainly understand the concerns about it getting to young people, which is why it makes sense for a ban, such as with cigarettes, to sell to people under the age of majority. However, having taken the substance myself one time, I can assure you that it is not an addictive substance nor one that does anything but commands respect from the user. With responsible use, it can have profound spiritual meaning and depth and allow for insight.

This isn't a party drug. By making it a schedule III substance, it will provide the perfect opportunity for the criminal underworld to take over the trade in salvia divinorum and make sure it gets to young people and is used irresponsibly.

Instead, I would suggest talking with adults versed in both responsible and effective drug policy, as well as those who have a holistic understanding of entheogens. The best way to minimize harm from salvia is to treat it with respect and take appropriate steps that responsible adults are the ones who can make the choice to use it.

Sincerely,

A rectangular area with a grey grid pattern, used to redact the signature of the sender.

Neil Magnuson The prohibition of plants and /or their derivatives... 2011-02-19 06:51:04 PM

**Regulating salvia divinorum**

[redacted] to: ocs.policy.and.regulatory.affairs

2011-02-19 06:51 PM

The prohibition of plants and /or their derivatives is an abomination and an assault against nature and the rights of adults to

choose as they desire UNLESS they are harming OTHERS.

Attempting to prohibit Salvia will only INCREASE the allure and demand, GUARANTEEING a black market supply completely void of regulations

that would otherwise serve to address any potential harms that can arise from the substances abuse.

While reasonable regulations imposed on the commercial sale of Salvia are warranted, IT is not in the purview of public SERVANTS to prohibit adults

from possessing ANY plants and or their derivatives UNTIL and UNLESS they are harming OTHERS in significant and demonstrative ways.

Natural law endows adults with unalienable human rights which override any man made laws. Using criminal sanctions against people possessing natural plants CAUSES far more harm than the substance in question and as such is itself a criminal act against sovereign individuals as well as the very foundation of our FREE society.

These prohibitions (opium, cocoa including and especially cannabis) and proposed prohibitions, are gross violations and are in violation of the publics trust.

To fail to properly regulate the COMMERCIAL sale of plants and or their derivatives that are PROVEN to have potential negative consequences, is a dereliction of duty,

To leave the commercial sale to the black market forces is inviting "Al Capone" and his cronies to prey upon our children in yet another way, directly CAUSED by the prohibition.

Salvia is not the problem, lack of education and regulations is the problem. and prohibition MAKES THE PROBLEM WORSE.

These are not my opinions, these are the findings of study after study and experts from all related fields. Prohibition CREATES and FUELS a black market that gets increasingly more violent the more enforcement of the laws is increased.

Sincerely,

s.19(1)

Dear [redacted]

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Office of Controlled Substances/Bureau des substances contrôlées  
Healthy Environments and Consumer Safety Branch  
Health Canada/Santé Environnementale et Sécurité des Consommateurs/Santé Canada

Regarding Salvia

to: ocs.policy.and.regulatory.affairs

2011-02-20 12:25 PM

To whoever may read this,

I was recently made aware of Health Canada's move to add Salvia to the Controlled Drugs and Substances Act, and am, in all honesty, confused as to why. There are no medically supported negative effects to Salvia, and as such to claim that it is a 'risk' is fundamentally a falsehood. One of the justifications oft heard was that it is, in some way, comparable to LSD which is on the Controlled Drugs and Substances Act, but to compare the two simply on the basis that they are both psychedelic is not a logical way to approach legislation. LSD's effects are far more significant, often lasting for hours, while

Salvia lasts only a few minutes (I would still argue that for LSD to be on the Controlled Drugs and Substances Act is also illogical, seeing as it too has been shown time and time again to be harmless, but that is an issue for another day). Although there have been a few highly publicized instances of people with mental issues, namely depression, having adverse effects to Salvia, to ban its use for the whole public is not a reasonable response. Surely if a substance has no medically documented negative effects then it must remain legal? Shouldn't the men and women of Canada be allowed to decide if they want to consume mind altering substances?

If you wanted to disallow minors from consuming Salvia, you would have my full support, but this is a fundamental insult to the dignity of the adult citizens of Canada. What justification can Health Canada possibly procure to justify further controlling the day to day lives of Canadians?

Sincerely,

A rectangular area of the document is redacted with a grey grid pattern, obscuring the signature.

Future criminalization of salvia

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-20 02:07 PM

Dear Ms. Chandler,

I am a [REDACTED]  
and a concerned citizen. I recently became aware of the fact that Health Canada is planning to

s.19(1)

fully criminalize the hallucinatory herb salvia. While I understand the Government of Canada's position regarding illicit drugs, may I present an alternate viewpoint?

I attach a copy of [redacted] High Time for Change, which was published last year in the Queen's Policy Review. [redacted] paper solely regards cannabis use, production, and sale, many of the points regarding criminalization of drugs in general bear strongly on salvia and its future use.

I would suggest the Government of Canada, advised by Health Canada, control salvia (and other drugs) in a similar manner to that in which alcohol and tobacco are controlled. Require buyers to be of age (say 18 or 19), present ID to prove their age, and only allow licensed sellers to grow and sell the substance, thus allowing the government to regulate growing methods and potency. For example, in Ontario, only a select few sellers (the LCBO, the Beer Store, the Wine Rack, and licensed bars, pubs, and restaurants) can sell alcohol. Similar requirements for drugs such as salvia and cannabis would greatly restrict the number of possible sellers.

These measures require legalization of the drug, but it's a much better solution than driving an entire industry underground where dealers will not care how old the buyers are, where the drug could be laced with anything because one does not know who grew it or how it was grown, and where the government has no records whatever on the amount of use.

Criminalization also seriously diminishes the likelihood of someone who has used the drug to seek help if they are experiencing side effects or are becoming addicted.

Criminalization further takes all the power away from government, puts it in the hands of the police, and burdens our justice department with unnecessary criminal cases. It also makes criminals out of youth who then go to jail, are put in contact with actually dangerous offenders, and return to the real world far more violent than when they left.

It bears repeating how much more dangerous to one's lifetime health alcohol and tobacco are, as compared to salvia or cannabis. Full numbers to prove this point can be found in the attached document, but there is not a single death that has been recorded as being caused by cannabis ingestion, while the numbers - I'm sure I needn't tell you - are very different for alcohol and tobacco.

Please consider these points when making decisions on drug regulation. Being "touch on crime" never mean harsher penalties on users.

Regards,

[redacted]

### A Sound, Humane, and Fiscally Responsible Marijuana Policy for Canada

Natassia Ciuriak

*Carleton University*

#### **Introduction**

If a country's legal framework is broadly in line with its society's values, it follows logically that crime will be minimized. No public policy more obstinately ignores this principle than that regarding marijuana. Despite statistics suggesting a large portion of the Canadian population uses cannabis regularly and an increasing portion of the public no longer supports its criminalized status, the current Conservative government under Prime Minister Stephen Harper is pushing for reforms that intensify its proscription including "reverse onus bail hearings, the elimination of conditional sentences and statutory release and especially, mandatory sentences."<sup>1</sup> These proposed legislative changes are symbolic of most governments' persistent and dominant mindset when it comes to drug laws: the sentiment is expressed as being 'tough on crime,' and the solution is to strengthen

---

<sup>1</sup> McKnight, Peter. "Canada should learn from U.S. mistakes; Putting more non-violent criminals in jail is not the solution to our justice problems." *The Vancouver Sun*. April 4, 2009: D5.

enforcement and to put more people (generally non-violent offenders when related to marijuana) behind bars. However, there is an increasing civil society movement towards more progressive and informed marijuana laws that incorporate such policies as harm reduction, decriminalization or legalization, education and prevention, and health care.

Based on an international comparative analysis, this paper will argue that Canada's marijuana laws, rather than toughened, should be changed in the opposite direction, to align them with strong scientific, social, empirical, economic, and historical arguments and evidence against criminalization. The paper will further argue that legalization is preferable to decriminalization.

This paper will first provide a short social and legal history of marijuana in Canada, for we cannot understand the steps that must be taken without first understanding how and why we have arrived at our present position. It will then develop three arguments. First, it will show why marijuana prohibition has failed to prevent or even decrease usage by examining the lessons learned from alcohol prohibition and the American criminalization of marijuana, and by exploring the current Canadian marijuana position. Second, it will assess whether decriminalization might provide a better legal framework based on an examination of the legal approaches the Netherlands and Portugal have taken. Third, it will discuss the differences between decriminalization and legalization by comparing marijuana's health and social effects to those of alcohol and tobacco, weighing each possibility's benefits and drawbacks as discussed in a 2002 Senate Special Committee report that strongly recommended legalization, as well as briefly reviewing the international barriers to implementing either option.

### **History of Marijuana Regulation in Canada**

Marijuana was first criminalized in Canada in 1923 when Parliament added it to the Schedule of the Opium and Narcotic Drug Act,<sup>2</sup> with "no debate, no justification, [and despite the fact that] many members did not even know what cannabis was."<sup>3</sup> Canada did not have a significant marijuana-using population at the time, and "there were no seizures of marijuana in Canada until

<sup>3</sup> Senate Special Committee on Illegal Drugs. *Cannabis: our position for a Canadian public policy: Summary Report*. Ottawa: Senate of Canada, 2002, p. 22.

1937.”<sup>4</sup> In her book on historic Canadian drug regulations, Catherine Carstairs argues this action was probably taken due to discussions at the Hague Opium Conference in 1911-12, which Mackenzie King attended, and because of the Geneva Convention of 1925, which limited Indian hemp to “medical and scientific” consumption.<sup>5</sup> The Senate Special Committee on Illegal Drug suggests “early drug legislation was largely based on a moral panic, racist sentiment and a notorious absence of debate.”<sup>6</sup> The moral panic regarding drugs coincided with, and was very strongly linked to, the panic that led to the prohibition of alcohol. Regarding marijuana specifically, the Committee describes “the criminalization of the drug [marijuana] as a solution without a problem”<sup>7</sup>; essentially preemptive legislation.

In 1969, following the 1960s’ rapid increase in marijuana use and public outcry for reform, the government appointed Gerald Le Dain, dean of Osgoode Hall Law School, as chairman of the Commission of Inquiry into the Non-Medical Use of Drugs. It “concluded that the criminalization of cannabis had no scientific basis.”<sup>8</sup> Despite a number of concerns, including that of the ‘gateway theory,’ which posits that marijuana leads to hard drug use, and the drug’s possible effects on youths’ brain development<sup>9</sup> (thirty years’ experience and research have shown these to be factually wrong and greatly exaggerated, respectively), “all members supported movement toward decriminalisation.”<sup>10</sup> Prime Minister Pierre Trudeau subsequently promised to advance legislation that would comply with the Commission’s recommendations. However, he was unable to do so before Joe Clark took over government, forcing the issue off the political radar screen.<sup>11</sup>

Three years after the Controlled Drug and Substances Act replaced the Opium and Narcotic Drug Act in 1997, the Ontario Court of Appeal struck down a federal law prohibiting possession of less than 30 grams of marijuana, ruling that “banning marijuana for medicinal purposes violates the

<sup>11</sup> *Ibid.*

Canadian Charter of Rights and Freedoms.”<sup>12</sup> This led to the Marijuana Medical Access Regulations of 2001, which made Canada the first country to permit medicinal marijuana use, but failed to address recreational marijuana use.<sup>13</sup> In 2003, the Ontario Court of Appeal ruled that the new regulations provided acceptable access to medical marijuana, re-criminalizing possession of marijuana for recreational purposes.<sup>14</sup> Later that year, the Supreme Court ruled that our marijuana laws “do not violate the Charter of Rights and Freedom and its protection of life, liberty and security of person.”<sup>15</sup>

Then, under the Liberal minority government of Paul Martin, Bill C-17 was introduced. Had it passed, “adults caught with less than 15 grams of pot could be fined up to \$400, but wouldn't have a criminal record.”<sup>16</sup> It also called for a doubling in the length of jail terms for marijuana growers.

The road to decriminalization ended with the election of the Harper Conservatives in 2006, the debate within government over changing marijuana's legal status concluded; criminalization and harsher penalties would be sought.

### **Has Criminalization Succeeded?**

The prohibition of alcohol in both the United States (1920-33) and Canada (duration specific to municipalities and provinces) has given us many insights into the effects of marijuana prohibition. Prohibition was enacted namely “to reduce crime and corruption, solve social problems, reduce the tax burden created by prisons and poorhouses, and improve health and hygiene.”<sup>17</sup> It is, however, largely considered a failure today for several reasons, including the following: “Alcohol became more dangerous to consume; crime increased and became ‘organized’; the court and prison systems were stretched to the breaking point; and corruption of public officials was rampant.”<sup>18</sup> Many of these symptoms currently characterize marijuana prohibition, particularly the increase in

<sup>18</sup> Ibid.

organized crime and the incarceration rate, which are also expensive and have thus greatly increased government spending.

Furthermore, according to Richard Cowan, prohibition of any substance is subject to the "Iron Law of Prohibition," which states that "when drugs or alcoholic beverages are prohibited, they will become more potent, will have greater variability in potency, will be adulterated with unknown or dangerous substances, and will not be produced and consumed under normal market constraints."<sup>19</sup> During alcohol prohibition, there was an important increase in potency: it was uneconomical to produce bulky, weak alcohols like beer, "because the largest cost of selling an illegal product is avoiding detection"<sup>20</sup> and stronger liquors like whiskey consume less space for similar alcohol content. Although potency has increased in marijuana<sup>21</sup>, this does not negatively affect the health of users, "because THC [marijuana's active component] does not cause physiological damage to organs or tissues."<sup>22</sup> The main danger is that it might be adulterated, or 'laced,' with chemicals, namely pesticides, which can have significant detrimental health effects.<sup>23</sup> The legalization of marijuana would allow government to set production standards to eliminate this threat.

Prohibition also heightened the "attractiveness of alcohol to the young by making it a glamour product associated with excitement and intrigue."<sup>24</sup> Although statistics of this kind are difficult to obtain for marijuana, anecdotal evidence suggests this plays a significant part in first time use of marijuana by youth.

So why does most of the developed world, particularly the United States, insist on criminalization? If the era of American Prohibition taught us anything, it was that repeal of that legislation "dramatically reduced crime, including organized crime, and corruption. Jobs were created, and new voluntary efforts, such as Alcoholics Anonymous, which was begun in 1934, succeeded in helping alcoholics."<sup>25</sup> These are the results every country wants, but governments are too frightened of the unknowns of decriminalization.

<sup>24</sup> Thornton, Mark. "Policy Analysis: Alcohol Prohibition Was a Failure."

<sup>25</sup> Ibid.

The main consequence of criminalization of marijuana in the United States has been the high incarceration rate, which until the 1980s, was roughly in line with the rest of the developed world, but is now five times the rate of the rest of the developed world, or 756 people per 100,000 residents<sup>26</sup> – the United States has “five per cent of the world's population, but 25 per cent of the known prison population.”<sup>27</sup> Much of this results from the imposition of mandatory jail terms for drug offences (a policy the Harper government is currently seeking to emulate). This eliminates the judiciary's ability to keep non-violent offenders out of jail, where they are likely to become violent: “most drug offenders serving time have been convicted of non-violent offences involving possession or low-level trafficking.”<sup>28</sup>

Additionally, the way in which drug laws are enforced in the United States perpetuates racism: “while illicit drug use rates among black and white Americans are similar, black people total (...) 74 per cent of those sent to prison. Consequently, one in nine black men in America is serving time.”<sup>29</sup> This racial disparity is also present in Canada, where Aboriginals are overrepresented in our prisons, with many of them serving time for drug offences.<sup>30</sup> In the United States the growing incarceration rate has also created 1.7 million “prison orphans” – children with parents serving time – who are “six times more likely than their peers to end up in prison themselves.”<sup>31</sup>

The criminalization of drugs has also led to the high mortality rate of police officers fighting the War on Drugs: “Across the U.S., a police officer dies on duty nearly every other day. Even more officers are wounded, too many fighting the war on drugs.”<sup>32</sup> This is because the sale of illegal drugs, often undertaken by organized criminals or dealers who are also users, leads to an atmosphere of violence, where “disputes about money or respect are settled with guns.”<sup>33</sup> However, it is important to note that much of this violence is absent from the marijuana market, as marijuana does not incite

<sup>33</sup> Ibid.

violence, is less expensive than other illegal drugs, and is often sold “in residential settings by dealers who do not themselves have expensive habits.”<sup>34</sup>

Consistent with the failures of the War on Drugs in general, marijuana prohibition has failed to prevent its continued use: “If prohibition decreased drug use and drug arrests acted as a deterrent, America would not lead the world in illegal drug use and incarceration for drug crimes.”<sup>35</sup> In fact, the United States has some of the highest usage rates in the developed world, and this considering its high penalties: “32.9% of Americans aged 12 and above have experience with cannabis and 5.1% have used in the past month. These figures are twice as high as those in the Netherlands [a country with very liberal marijuana laws].”<sup>36</sup> In fact, “proportionally, more Americans have used cocaine than Portuguese [where drugs were decriminalized in 2001] have used marijuana.”<sup>37</sup> However, the United States refuses to officially acknowledge or understand the logic behind decriminalization and has instead “single-mindedly agitated for greater criminalization approaches and appears, at least to [European Union] officials, interested solely in enforcement actions, rather than empirically vindicated policy changes (...) designed to manage usage rates and ameliorate drug-related harms.”<sup>38</sup>

Canadian officials are following the Americans despite statistics that suggest our drug, and specifically marijuana, policies are ineffective. In fact, depending on the study, somewhere between 23%<sup>39</sup> and “over 30%”<sup>40</sup> of Canadians have used marijuana at least once in their lives. Furthermore, in 2002, the Senate Special Committee on Illegal Drugs reported that “approximately 2 million Canadians over age 18 have used cannabis during the previous 12 months, approximately 600,000 have used it during the past month, and approximately 100,000 use it daily.”<sup>41</sup> However, only 0.85% of them were charged with possession.<sup>42</sup> Furthermore, “over 50% of all drug-related incidents

[reported by police] involve possession of cannabis.”<sup>43</sup> Those who are charged and convicted face negative effects to their financial situation, career opportunities, and restricted travel.<sup>44</sup> It is also important to note that, according to the Senate Special Committee, Canadian drug enforcement is unevenly applied, which could lead to “discriminatory enforcement, alienation of certain groups within society, and (...) disrespect for the law.”<sup>45</sup>

Marijuana law enforcement is thus a waste of time and taxes “not warranted by the danger posed by the substance.”<sup>46</sup> If the government passes Bill C-15, this waste can increase, without greatly affecting usage rates, as the bill is designed to discourage marijuana growers. However, the Fraser Institute’s Stephen Easton points out that the rewards are simply too high for Canadian marijuana growers (“the 100-plant grow-op makes around 55 percent return for a year’s worth of activity,”<sup>47</sup> according to conservative estimates) and that as soon as one of the roughly 17,500<sup>48</sup> British Columbia grow-operations is closed by police, another opens. In fact, the Senate Special Committee estimated in 2002 that 50% of the marijuana available in Canada is grown in the country, mostly in British Columbia, Ontario, and Québec.<sup>49</sup> Although C-15 might deter some growers due to mandatory prison terms, the cost of law enforcement would almost surely increase, from the estimated current costs of between \$700 million and \$1 billion.<sup>50</sup>

### **Decriminalization in Europe**

One must wonder if there is a better public policy option than such an ineffective, costly, and socially harmful one as criminalization. Much of Europe is experimenting with unofficial decriminalization: marijuana is technically criminalized, but few, if any, users are arrested or charged, and none are imprisoned – it is for the most part a depenalized system. A well-known example is the Netherlands, where “coffee-shops” are licensed to sell small quantities of marijuana to adults (buyers must show identification, similarly to when buying alcohol or tobacco). Marijuana is taxed and production is standardized, allowing buyers to know the strength of the marijuana and to be assured

<sup>50</sup> Ibid., p. 24.

of consistent quality. Sellers are also informed and able to provide important advice to first-time buyers. The public atmosphere is acceptant and non-judgmental. However, only 17% of the Dutch population 12 years or older have reported a lifetime prevalence (having used the drug at least once in one's life), compared to 36.9% in the United States.<sup>51</sup> In fact, a study comparing marijuana use in Amsterdam and San Francisco found that "there were no differences between the 2 cities in age at onset of use, age at first regular use, or age at the start of maximum use."<sup>52</sup> The study also notes that "Dutch decriminalization does not appear to be associated with greater use of other illicit drugs relative to drug use in San Francisco, nor does criminalization in San Francisco appear to be associated with less use of other illicit drugs relative to their use in Amsterdam;"<sup>53</sup> in fact, they found that the reverse may be true. Furthermore, they argue that the data they collected suggest that marijuana users "organize their use according to their own subcultural etiquette—norms and rules about when, where, why, with whom, and how to use—and less to laws or policies."<sup>54</sup>

Portugal has gone one step further than the Netherlands. In 2001, this deeply conservative, Catholic country decriminalized all drugs, not just marijuana, thus "no distinction is made between the types of drug (so-called hard drugs or soft drugs)."<sup>55</sup> Decriminalization, it should be clear, means that drugs are still prohibited, but the possession of small amounts of drugs for personal use has been removed from criminal law and is instead treated administratively. If police catch someone using drugs, they refer them to a Commission for Dissuasions of Drug Addiction, which may issue a fine or simply a warning to non-addicted consumers.<sup>56</sup> Though the Commissions may not force addicted users to seek treatment, they can suspend sanctions on the provision that he or she agrees to undergo treatment.<sup>57</sup> Although rarely used, they may also impose "suspension of the right to practice a licensed profession (...); a ban on visiting high-risk locales (nightclubs); a ban on associating with specified individuals; requiring periodic reports to the commission to show there is no ongoing

addiction or abuse; prohibitions on travel abroad; termination of public benefits for subsidies or allowances.”<sup>58</sup>

It is important to understand that the intent of the changes was specifically to reduce usage. Drug use rates in Portugal, specifically those for heroin, were among the highest in the EU, causing pervasive and perverse social repercussions. Legalization was not considered, however, as “numerous international treaties impose the ‘obligation to establish in domestic law a prohibition’ on drug use.”<sup>59</sup> Despite the seeming leniency of the system, the Portuguese have found it to be remarkably successful. Police have found that “treatment options (...) are far more effective than turning users into criminals (who (...) were typically back on the street the next day, but without real treatment options).”<sup>60</sup> In fact, both Portuguese and European officials emphasize that “the overriding goal of that process is to avoid the stigma that arises from criminal proceedings,”<sup>61</sup> allowing addicts to seek treatment without fear of reprisals. The important point is that Portugal defined the public policy problem of drug use as a health issue, not as a criminal one, as the United States have.

Prior to decriminalization, many Portuguese politicians worried that the proposed changes would make Portugal a “safe haven” for foreign drug users. This has been disproven: “Roughly 95 percent of those cited for drug offenses (...) have been Portuguese. Close to zero have been citizens of other EU states.”<sup>62</sup> There was also the worry that decriminalization would suggest that drug use was considered to be acceptable and that it would increase dramatically as a result. The data are, in fact, extremely favourable on this point: “for those two critical groups of youth (13–15 years and 16–18 years), prevalence rates have declined for virtually every substance since decriminalization.”<sup>63</sup> In 2006, Portugal had the lowest lifetime prevalence rates for marijuana use in the EU (8.2% for Portugal compared to 25% for Europe generally).<sup>64</sup>

Although it is not perfect, Portugal’s decriminalization framework appears to be far more effective at actually reducing drug use than criminalization. Law enforcement and the justice system have also seen significant savings, which have been re-routed into addiction-treatment facilities,

reinforcing the system and its goals. But would legalization, with its accompanying regulations and taxation measures, be a better system? Is it even possible in Canada, given our relationship with the United States and our international commitments?

### **Decriminalization versus Legalization**

Before embarking upon this line of argument, it is important to note the differences between marijuana and the two prominent legal drugs in our society, alcohol and tobacco. Marijuana, unlike alcohol and tobacco, is significantly less harmful to one's health and does not produce similar societal externalities. From 2000-2001, there were "27,084 hospital admissions involving alcohol-related conditions."<sup>65</sup> Furthermore, 61% of alcohol-related severe trauma hospitalizations were related to traffic accidents, 21% were due to falls, and assaults and homicides accounted for 18%.<sup>66</sup> Also, in 2006, traffic crashes accounted for 3,122 deaths in Canada.<sup>67</sup> In 1996, 133 people were involved in fatal collisions, killing innocent people, while driving under the influence.<sup>68</sup> Alcohol is also a cause of fetal alcohol syndrome, spousal abuse, and other forms of violence.

Tobacco is also a significant killer: 45,000 Canadians die from smoking-related causes each year – the primary preventable cause of death – and 100 of these deaths are among infants.<sup>69</sup> Although there are no comprehensive Canadian statistics regarding second-hand smoke, "international scientific reviews indicate that [it] is the third leading cause of preventable death (after smoking and drinking alcohol)."<sup>70</sup> One needs no statistics to know that tobacco is highly addictive and linked to many different cancers.

Marijuana is very different. When the Senate Special Committee began hearing witnesses for its report, it found that most were very critical of the fact that the Controlled Drugs and Substances

<sup>70</sup> Ibid.

Act “did not categorize drugs on the basis of the dangers they represented [to society].”<sup>71</sup> According to a 1996 study published by the Canadian Centre for Substance Abuse based on 1992 data (thus these costs have probably increased), “the costs associated with all illegal drugs were \$1.4 billion, compared with \$7.5 billion [for] alcohol and \$9.6 billion [for] tobacco.”<sup>72</sup> The primary costs of illegal drugs are measured based on externalities: loss of productivity, health care, and losses in the workplace. Loss of productivity is measured by mortality and morbidity costs, which, apart from traffic fatalities caused by driving while high, are nil for marijuana.<sup>73</sup> Furthermore, the vast majority of marijuana users, especially heavy users, are youth that are not yet part of the workforce, and thus represent very little or no losses in the workplace.<sup>74</sup> Therefore, according to the Senate Special Committee, “cannabis itself entails few externalities.”<sup>75</sup>

It is also “not a cause of violence,” nor is it “a cause of delinquency and crime.”<sup>76</sup> Furthermore dependence or addiction caused by marijuana is both less severe and less frequent than those caused by alcohol or tobacco.<sup>77</sup> Marijuana does not lead to the use of harder drugs, and long-term effects are reversible.<sup>78</sup> Excluding its relation to organized crime and driving while impaired, “cannabis involves few of the factors that generate criminal behaviour.”<sup>79</sup> For these reasons, the criminalization of marijuana is clearly not related to any health reasons, as it is far less harmful than alcohol and tobacco, both legal and regulated substances. This calls into question why criminalization continues to this day; it is certainly not based on rational analysis of costs and benefits to society nor in any way consistent with legal treatment of other recreational drugs. One may speculate that it is based on a general moral panic towards drugs.

When the Senate Special Committee began its work, it developed a mission statement recognizing that the rule of law is not the only source of normative rules and that government must use the “instruments of constraint” only sparingly in a free society. The Committee asserted that “public policy on psychoactive substances must be structured around guiding principles respecting

the life, health, security and rights and freedoms of individuals, who, naturally and legitimately, seek their own well-being and development and can recognize the presence, difference and equality of others.”<sup>80</sup> They underline the importance of only criminalizing “offences involving significant direct danger to others.”<sup>81</sup> Marijuana use, significantly, is a victimless crime.

These statements make reference to a few important notions. First, it is time that our free and democratic society recognizes that adults are competent to decide for themselves whether or not they wish to use marijuana. We have already acknowledged this competence regarding far more harmful substances, namely alcohol and tobacco. Even prescription drugs, which may have significant ill health effects, as prominently listed on the labels, are merely regulated, with the discretion to use ultimately resting with the user. It is clearly not a perfect system, as many people become addicted to legal drugs, but “at least a system of distribution involving doctors and pharmacists works without violence and high-volume incarceration.”<sup>82</sup> Science has shown marijuana to be less harmful, which should dispel the moral panic surrounding this substance.

Second, the Committee’s statements make reference to instruments of constraint. Regarding drugs, criminalization is the most constraining policy tool available and is clearly ineffective. Decriminalization is much less socially damaging, but, nonetheless, removes many effective tools from the government’s control: they may only make drug violations administrative offences, exacting small fines from users. Legalization, on the other hand, affords governments the use of a wide array of policy tools that would enable them to make marijuana safer and ensure it is sold only to adults. In fact, the Senate Special Committee favoured a legalization framework primarily because of the lack of control associated with decriminalization.<sup>83</sup> Legalization allows government to assert control over the production of marijuana, which is primarily related to controlling pesticide use. This lowers the risk of adverse health effects from asymmetrical information regarding the product’s quality.

This framework would also allow governments to assure consistent quality, affording buyers confidence in the drug’s type and strength. The government or licensed companies would produce the marijuana and licensed retailers would sell it, thus completely removing the criminal element from the marijuana trade, which is the major danger associated with it. The end of alcohol

<sup>80</sup> Senate Special Committee on Illegal Drugs. *Cannabis: our position for a Canadian public policy: Summary Report*, p. 7.

<sup>81</sup> *Ibid.*, p. 12.

<sup>82</sup> Moskos, Peter and Stanford Franklin. “Legalizing drugs will lead to cuts in crime.”

<sup>83</sup> Senate Special Committee on Illegal Drugs. *Cannabis: our position for a Canadian public policy: Summary Report*, p. 34.

prohibition did just that – organized crime elements could no longer profit from the sale of alcohol, as safer, better, and often cheaper alcohol was available from licensed sellers. A key improvement accompanying licensing systems for sellers is that of controlling youth's access to the drug. It is unlikely to be perfect – the current system for alcohol sales still allows many under-age drinkers to gain access to alcohol, but the legalized and regulated system works far better than prohibition did.

Finally, legalization would allow the government to apply a “sin tax” to marijuana sales, similar to those applied to alcohol and tobacco sales. This is not a primary motivation behind legalization, but it is an important one. Stephen Easton with the Fraser Institute attempted to conservatively estimate the revenue from sales taxes on marijuana. Based on the assumptions that the marijuana is valued at retail street price and sold by the gram,<sup>84</sup> quantities in which most licensed retailers would deal, the amount of British Columbian marijuana produced is worth approximately \$7.156 billion.<sup>85</sup> He calculates that the production costs per gram are approximately \$4.70 and the street returns per half gram of \$8.60.<sup>86</sup> Easton argues that consumers have already shown themselves willing to pay this price for marijuana; therefore, if the government or licensed companies were to produce the legal marijuana at lower costs (making use of economies of scale) and sell it at the current price, they could tax the difference (an amount that is currently profiting illegal producers). Easton estimates this tax revenue to be approximately \$2 billion.<sup>87</sup> This amount would be substantially higher if we were to consider an export tax, which is a difficult proposition because of American and international drug prohibitions. All the same, combined with the savings from reduced law enforcement, fewer trial costs (Canadian Alliance MP Keith Martin estimated that decriminalization of marijuana possession would save Canada \$150 million each year in court costs<sup>88</sup>), and lower prison budgetary needs, these substantial tax revenues could be re-routed to fund educational drug-prevention programs, which must be “credible, verifiable and neutral,”<sup>89</sup> as well as substance abuse treatment centers to help lower the social costs of other, still-criminalized drugs. As Easton points out, “the broader social question has become not whether we approve or disapprove of

---

<sup>84</sup> Easton's calculations are made in terms of the amount of marijuana required to roll a marijuana cigarette, or joint. This is approximately one gram.

<sup>89</sup> Senate Special Committee on Illegal Drugs. *Cannabis: our position for a Canadian public policy: Summary Report*, p. 26.

local production, but rather who shall enjoy the spoils. (...) Unless we wish to continue the transfer of these billions from this lucrative endeavor to organized crime, the current policy on prohibition should be changed."<sup>90</sup> Despite the United States declining to implement such a regulated system with taxation, if it were to end its War on Drugs it would save \$44 billion annually, with an additional \$33 billion from taxation, according to Harvard economist, Jeffrey Miron.<sup>91</sup>

Finally, it is important to note that a legalization scheme for marijuana would necessitate some form of amnesty program for people previously convicted of simple possession, removing the negative social, career, and travel effects of a criminal conviction carries, which is advocated by the Senate Special Committee.<sup>92</sup> The government is attempting to encourage low-income earners to enter the workforce to help address the long-term problem in Canada of a rising dependency ratio that threatens the solvency of Canada's pension system. Restoring to potentially full employability the 600,000 Canadians whose employment prospects have been diminished through marijuana convictions would have a much greater effect in expanding the effective Canadian labour force with no fiscal costs.

Before concluding, it is necessary to briefly discuss the international constraints on legalization. We have already discussed the American War on Drugs and the fact that the United States is highly unlikely to change its stance on drug criminalization. Despite this, first-term Virginia democratic senator Jim Webb has advanced a bill to create an independent commission, similar to the Portuguese one that recommended decriminalization, to review the War on Drugs, its costs, and its results.<sup>93</sup>

However, there are a number of international drug control conventions, to which Canada is a party, that call for continued prohibition of drugs. As we have seen, this does not preclude decriminalization, but it would constrain legalization. The Senate Special Committee considers these conventions to be "an utterly irrational restraint that has nothing to do with scientific or public health considerations."<sup>94</sup> In fact, the Committee found that the conventions instead reflect 20<sup>th</sup> century geopolitical North-South relations: "the strictest controls were placed on organic substances

– the coca bush, the poppy and the cannabis plant – which are often part of the ancestral traditions of the countries where these plants originate, whereas the North's cultural products, tobacco and alcohol, were ignored and the synthetic substances produced by the North's pharmaceutical industry were subject to regulation rather than prohibition.<sup>95</sup> These conventions echo a contributing factor to the original criminalization of most drugs: racial prejudices.

The Senate Special Committee therefore argues that Canada should request the removal of cannabis and its derivatives from these international conventions, as their classifications do not reflect the danger the drugs pose to health and society.<sup>96</sup> They also called for the creation of a Drugs and Dependency Monitoring Agency for the Americas, to be developed within the Organization of American States.<sup>97</sup> This would allow for accurate, unbiased collection of data to support research into drugs and their health and social effects and to help prevention and education efforts.

### Conclusion

Canadian public opinion regarding marijuana has become more informed and there is now growing public support for decriminalization and, to a lesser extent, legalization.<sup>98</sup> This is not surprising considering an estimated 4.5 million people (about 14% of the population) used marijuana in 2004 and 600,000 Canadians have a criminal record for marijuana possession,<sup>99</sup> which would be purged if the law changes. The Senate Special Committee argued that it is not the State's role to "impose a particular way of life on people."<sup>100</sup> The State must respect adults' freedom to choose which substances they wish to consume and to use exhortative, as opposed to coercive, means to promote "an ethic of responsibility [that] teaches social expectations (...) and responsible behaviour."<sup>101</sup>

Through a comparative analysis of the historic case study provided by the criminalization and subsequent legalization of alcohol, American criminalization, and Dutch and Portuguese decriminalization, this paper has shown that criminalization is ineffective at reducing drug

consumption and the accompanying crime. It has also demonstrated that legalization affords governments more regulatory tools, allowing the creation of a controlled environment, similar to the alcohol and tobacco markets. Legalization allows drug distribution to become “the combined responsibility of doctors, the government and a legal and regulated free market.”<sup>102</sup> Finally, the fiscal revenues that could be generated by legalization (approximately \$2 billion), combined with the fiscal savings on enforcement (approximately \$1 billion), prosecution (approximately \$150 million), and incarceration would not only cover the costs of proper regulation, but generate a fiscal bonus to fund other priorities. Going in the opposite direction, as the Harper government proposes, simply digs the fiscal hole even deeper.

[redacted] my thoughts on Salvia divinorum

OCS Policy and Regulatory Affe Dear [redacted] I am writing to acknowledge receipt of your email with

Dear [redacted]

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Office of Controlled Substances/Bureau des substances contrôlées  
Healthy Environments and Consumer Safety Branch  
Health Canada/Santé Environnementale et Sécurité des Consommateurs/Santé Canada

[redacted] " Because its psychoactive effects resemble tho... 2011-02-20 02:20:50 PM

my thoughts on Salvia divinorum

[redacted] to: OCS.Policy.and.Regulatory.Affairs 2011-02-20 02:20 PM

" Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth."

My first comment is that this is only true in a general sense and I suspect that most people who

have used *S. divinorum* would object to this characterization. For a direct comparison of how the subjective effects of these drugs are described by users of *S. divinorum* and drugs such as LSD, I suggest you visit Erowid's "trip reports" section (at [www.erowid.org](http://www.erowid.org); see also Johnson et al., 2010). *Salvia divinorum* has a unique pharmacology and appears to elicit its effects via its action as a kappa-opioid receptor agonist (Chavkin et al., 2011).

The differences in subjective effects are likely due to differences in the mechanisms of actions. Indolealkylamine hallucinogens such as LSD and psilocin are thought to work via 5-HT<sub>2A</sub> agonism (Ebersole et al., 2003; Fantegrossi et al. 2008).

Similarity in the subjective effects of drugs does not necessarily imply a similarity in the safety profile of such drugs. This, is actually an unfortunate fact as LSD and psilocin are essentially non-toxic (Nichols, 2004 and references therein). It is unfortunate that the prohibition of physiologically safe molecules such as LSD and psiloc(yb)in has led to an almost 40 year hiatus in research on these hallucinogens.

The prohibition of these substances had not prevented their use, nor does it appear to have limited the use of hallucinogenic drugs. Instead of being able to access pure LSD or psiloc(yb)in, users risk obtaining adulterated products from the underground market. Some of the drugs that have been sold as LSD include much longer acting hallucinogens such as DOB (Microgram Bulletin, 2006). Substituting DOB for LSD can potentially lead to more adverse reactions due to the lengthy duration of DOB. In my opinion, drug prohibition has not reduced the harm from illicit drugs to any degree and may even increase the danger of using illicit drugs.

I have two objections related to the placement of *Salvia divinorum* and/or its active components on the Controlled Drugs and Substances Act schedule III. The first is that prohibiting the drug will simply drive its use and distribution underground, which will make it more dangerous to use the drug due to possible adulteration.

The second is that prohibition of the drug will halt medical and scientific study on *Salvia divinorum* and its active substances, as prohibiting LSD and other hallucinogens did in the 1960s. Research on the active compounds of *S. divinorum* which have implication for mood disorders (Vortherms and Roth, 2006), could grind to a halt. Two psychopharmacologists at Johns Hopkins, Griffiths and Johnson, stated that research with salvinorin A "has potentially important implications for understanding a variety of disease states, including Alzheimer's disease, schizophrenia, bipolar disorder, dementia, and drug dependence."

I have not seen any compelling evidence to suggest that *Salvia divinorum* is dangerous. The limited trials in humans suggest that it is safe, though the small sample size limits one's confidence in such conclusions (Johnson et al., 2010). If Health Canada's position is that prohibition of *Salvia divinorum* and salvinorin A would be intended to protect the health of Canadians, then I think Health Canada should fund some research to study the physiological effects of these drugs and determine their safety profile and toxicity. In the absence of such information, it is not reasonable to assume that the substances are dangerous and place them on the CDSA, because that would effectively prevent the scientific and medical communities from

s.19(1)

learning anything from these compounds and wouldn't do anything to prevent harm caused by use of these drugs anyway.

When people take drugs, most of them understand that they are taking risks and putting drugs on the CDSA doesn't cause anyone to believe that the drug is too dangerous to be used under any circumstance. Putting *S. divinorum* and salvinorin A on the CDSA will just anger users of the drug, slow scientific and medical research on the drug and drive use of the drug underground, which could potentially cause more harm.

I genuinely believe that placing *S. divinorum* and salvinorin A on the CDSA will do more harm than good.

Sincerely,

[REDACTED]

Dear [redacted]

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Office of Controlled Substances/Bureau des substances contrôlées

Hello

As a citizen of Canada, I want an evidence based drug control policy. In order for *Salvia divinorum* to become a controlled substance in Canada, it should first be shown by Health Canada to be more harmful and addictive than other legal substances like alcohol and tobacco. If a drug cannot be proven to be more harmful and addictive than *legal* substances in Canada, that substance should remain legal. Regardless of personal philosophies, this is merely just logical

**s.19(1)**

consistency.

I am not a drug user - I even avoid alcohol. But personal freedoms in Canada should not be under siege without strong scientific evidence. Please support an evidence based drug control policy.

Thanks

**Ban on Salvia divinorum is irresponsible**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-20 07:59 PM

Hello,

As a Canadian citizen I am absolutely appalled by Health Canada's recent decision to ban *Salvia divinorum*. Not only has Health Canada not backed up this proposed ban with scientific evidence, it is under the guise of protecting children. I don't know about you, but last time I checked drug dealers don't ask for ID when selling their products, and hold no qualms about selling our children drugs on the school playground.

**s.19(1)**

If you truly want to protect our nations youth, you would control the sale of Salvia divinorum similar to Alcohol and Tobacco, where it is only sold to adults and kept out of the hands of children. It is a complete hippocracy that Health Canada is proposing this ban while keeping drugs like Alcohol and Tobacco legal, which cause far more harm to the users health, and society as a whole. Even if Salvia divinorum is found to have noticeable health effects, the social and financial costs of enforcing this ban will far outweigh any health effects.

As a Canadian citizen I urge Health Canada to support an evidence based drug control policy, instead of a morals based one. I sincerely hope Health Canada will reconsider this decision, and not continue decades of failed drug policies.

Thank you for your time,

OCS Policy and Regulatory Affairs: Fw: question about comment submission deadline

Hi Denis,

Please see the proposed response for your review:

\*\*\*\*\*

Dear [redacted]

The 30-day comment period relating to the Notice to Interested Parties regarding the proposal to add *Salvia divinorum* and salvinin A to Schedule III of the *Controlled Drugs and Substances Act* (CDSA) began on the date of its publication in the *Canada Gazette*. Therefore, it would be appreciated if you could submit all comments regarding this proposal by March 21, 2011.

Sincerely,

Stephanie Chandler

Dear Stephanie Chandler:

Re: Canada Gazette GOVERNMENT NOTICES Vol. 145, No. 8 — February 19, 2011

Could you confirm that the deadline for responding to this proposal is 30 days after the date it was published in the Gazette (February 19, 2011), and not 30 days after the date at the bottom of the notice (Feb 4, 2011).

Also I assume that it is 30 calendar days and not 30 business days, but would also appreciate clarification on this point.

Thanks.

OCS Policy and Regulatory Affairs: Fw: Regarding Salvia Divinorum request for comments

Hi Denis,

I have slightly revised our original email to stakeholders to notify them of the NOI to answer the attached email. For your approval.

Stephanie

\*\*\*\*\*

Dear [REDACTED]

A *Notice of Intent to Interested Parties* (NOI) regarding the following substances was published in the *Canada Gazette*, Part I on February 19, 2011:

- *Salvia divinorum*
- Salvinorin A

The electronic version of the NOI is available at the following website:

<http://www.gazette.gc.ca/rp-pr/p1/2011/2011-02-19/pdf/g1-14508.pdf> , pages 8-9 in PDF format (pages 438-439 in *Canada Gazette*, Part I).

This NOI outlines Health Canada's proposal to include *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* (CDSA). In particular, Health Canada is seeking further information from stakeholders as to whether these substances have any legitimate industrial, scientific or medical uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulatory controls.

If you are interested in this process or wish to provide us with information for our consideration please do so by March 21, 2011. You may send your comments to Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada K1A 1B9, by fax at (613) 946-4224 or by email to [OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca](mailto:OCS.Policy.and.Regulatory.Affairs@hc-sc.gc.ca).

**Salvia Divinorum**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-20 09:52 PM

Hello!

I recently came across an article about the proposed ban on Salvia Divinorum/ Salvinorin A. I was directed to you as the only source of information and contact in the matter. It concerns me, as a citizen of Canada, that the process for deciding these matters is completely inadequate.

**s.19(1)**

Without any research pointing negatively to effects of such a substance, no negative accounts recorded except the only quotable offense of just one threat to police dating 5 years ago, it is claimed a threat to society and youth. Can I ask how many times Canadian police officers have been threatened by sober people? How about under the influence of alcohol? I would wager it will come to a total of more than one but, without a study to find any fault per substance, none can be claimed by me. Without substantial proof of direct cause or even correlation to a negative social affect of anything, let alone substances, no legal precedence should ever occur. Doing so is I direct assault on the freedoms of every Canadian citizen to live their life the way they see fit. It bends people to an opinion driven legal bind with no evidence to support being bound as a positive measure for society. Pardon my being cliché, but there is no better definition of fascism. A massive amount of tax dollars already goes to waste protecting laws produced under this definition. Do not add more without reason above the fact that it is psychoactive, it is an assault on truth.

I would like to request more information on the process incurring, as well as request at least some study into the effects of salvinorin A. The science base of the world deserves such knowledge before a decision is made. We do not know what the plant may hold. Banning it will only increase its use in a negative way due to publicity, make it a black market substance; damaging it's integrity, and destroy any research potential into the positive effects such a substance may hold.

Thanks for your time.

**Ban on Salvia divinorum**

to: ocs.policy.and.regulatory.affairs

2011-02-20 09:56 PM

Hello

It has recently come to my attention that Health Canada intends to impose a ban on the substance *Salvia divinorum*. I request that Health Canada first release the evidence and information used to come to this decision, before the ban itself is put into effect. This ban implies *Salvia* to be more harmful and addictive than legal substances such as alcohol and tobacco and any information regarding this danger should be public knowledge. If in fact *Salvia* can NOT be shown to be as or more harmful than alcohol or tobacco, then logically it must not be banned while the others remain in the open. I hope that you will practice a

consistent, evidence-based, transparent process regarding these matters.  
Thank you for your time.

**Proposal to schedule S. divinorum and Salvinorin A**

[redacted] to: OCS.Policy.and.Regulatory.Affairs

2011-02-21 03:56 PM

Greetings,

I'm interested in commenting about the proposal to schedule S. divinorum and Salvinorin A.

As someone who has experimented with the substances described above, I would ask that the proposal is dropped. Salvia, while known as a legal psychotropic substance, is not one with potential for abuse. While they can be strong, the effects are temporary. The effects are also very

short-lasting and require high grade a potency to achieve. Growing the plant also requires very a specialized environment, and the plant must be grown from clones, which make it very difficult to cultivate and propagate.

According to the Canadian Medical Association Journal (<http://www.cmaj.ca/cgi/content/full/178/2/149>, published January 15, 2008), half of teenagers have used alcohol, and about 20% of those users have used it such that it lead to adverse effects. The article further describes that Marijuana has been used by as many as about 30% of youth in Canada, and most illegal drugs, including Methamphetamine, LSD, and other psychoactive have been used by as few as 5%. Salvia, by Health Canada's survey, has been used at least one time by as few as 7% of teenage users, and frankly the effects, also by Health Canada's description, are not readily enjoyed by users. Prohibiting the possession of salvia will do little to curtail its use, but it will expose the few users to greater possible harms through the few remedies that exist within the legal system.

I implore Health Canada to consider rejecting this proposal. There is no need for it at this time.

Thank you for your consideration.

Regarding the Governments Proposal to make the Natural Product called "Salvia" illegal; This law will only serve to make more so-called "criminals" out of Canadians. As well, this law will only force the

underground market to take control and sale of this product, in exactly the same way as other so-called "illegal" drugs. The Government never seems to learn anything from past History. One only needs to review history during the time that the USA banned alcohol, to see that even more people died because of the ban. Now that alcohol is legal, we don't see any more drive-by-shootings over beer.

**Salvia Divinorum**

to: OCS.Policy.and.Regulatory.Affairs 2011-02-21 08:30 PM

I am against a proposed ban on salvia Divinorum.

Salvia is a religious sacrament for many people and is has no potential for abuse as most people who try it do so only once and then never again.

The effects are too weird. Salvia is not a fun drug at all. If you don't believe me try it your self!

Banning Salvia will only start a black market in it furthering the enrichment of criminal gangs.  
Regulate the sale to adults over 18 or 19 like beer is.

Regulation is the only humane option to controlling drug use.

How many children are you planning to put in jail ?

How many spiritual seekers are you planning to put in jail ?

Thanks for your time.

Dear Sir/Madam,

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act (CDSA)*.

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Office of Controlled Substances/Bureau des substances contrôlées

**Salvia Divinorum needs to be regulated for safety issues and taxed.**

[redacted] to: OCS.Policy.and.Regulatory.Affairs 2011-02-21 11:34 PM

The effects of Salvia are very important to know for people. Salvia is a distinct looking plant that when smoked can provide 5 minutes of elation or nervousness. If salvia was banned no one would have any idea what it does and not have any responsibility if anything bad came out of it.

Savlia Divinorum needs to be regulated and taxed for safety issues, while Salvia Extract is

more potent it generally last less then 5 minutes with a 45 minute afterglow that has more to do with elation and wakefulness. Also people can not drive during the depths of a salvia extract trip, when people come to everything is fine. People need to be aware this goes away or at least not be in a car driving if they smoke a hard variant such as this.

It is not like LSD which last for hours or has a dependence issue like alcohol and tobacco. It won't tax the healthcare system either like diabetes.

Making it illegal will cause the price of it to skyrocket and be sold without any safety net.

regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-22 01:03 AM

Dear Stephanie Chandler

As a tax paying Canadian father, I believe that I am a stakeholder and I am taking this opportunity to

provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its

main active ingredient salvinorin A to Schedule III to the Controlled Drugs and Substances Act (CDSA).

My intention is not to dispute Health Canadas concern that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, but rather contend that prohibition is

not the answer & it would in fact exacerbate the situation & be a waste of our finances. Resources

wasted on arrest, processing, prosecuting & incarcerating to enforce prohibition could be used in effective ways instead & have much left over for our betterment.

From what I have read about *Salvia* there is nothing distinguishing such as smell to differentiate it

from any other ground up plant matter. Any culinary artist would be a suspected trafficker. Imagine

the logistic problems & opportunities for abuse by law enforcement. I support LEAP (Law Enforcement

Against Prohibition [www.leap.cc](http://www.leap.cc)), a 5000 member strong organization that would agree with me. In fact I

have yet to find anyone that believes that prohibition works.

To be clear, I do NOT want the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient

salvinorin A to be added to Schedule III of the Controlled Drugs and Substances Act (CDSA). I believe

that doing so will just create a black market for yet another "controlled" substance. There is no

**s.19(1)**

regulation in a black market which poses even more health risks. I feel that education through unbiased

research & freedom of choice are better recieved by a free society than force.

Please feel free to contact me with any questions, concerns, or suggestions regarding my comments.

Sincerely,

s.19(1)

**Salvia divinorum**

[redacted] to: ocs.policy.and.regulatory.affairs 2011-02-22 09:25 PM

I am opposed to Health Canada's proposal to add salvia to the Controlled Drugs and Substances Act. There are no conclusive studies to indicate that this substance causes anything more than brief hallucinogenic affects. It is not the role of the Canadian government to ban substances simply because they are used recreationally. We need to be very careful when adding further restrictions to the rights of individuals. In a free society, this must not be done casually or arbitrarily.

Salvia has primarily been brought to recent public attention by the RCMP and other police agencies. Canadian police are looking for empowerment so they can take action on controlling this substance. I

have no doubt they see this as their duty in order to protect Canadians. Salvia is a plant that affects perception and mood, and so it naturally draws parallels to marijuana. Police believe they should be authorized to control salvia in the same way they control marijuana.

Adding a substance to the CDSA simply because it resembles other currently controlled substances is not valid reasoning. Each substance should be evaluated on its own risk to human well-being. There is currently no data to support that this substance poses a serious health risk. Anecdotal evidence is not an adequate justification to cut away a piece of Canadian society's freedom. A group of vocal individuals who hold unsupported opinions that something "might be bad" is not an adequate justification to make that thing illegal.

Aside from the lack of evidence to show any significant health risk from salvia, there is the economic and social impact of this decision. If you make this substance illegal, the desire to use it is not going to go away. You are immediately creating a black market where criminals will produce and sell the substance, instead of this being done by legitimate business owners. Police resource will need to increase to control it, requiring additional tax dollars. The criminal element will not be paying taxes on revenues from the sales of this substance. History has shown that a government cannot arbitrarily convince its citizens that a substance is harmful, without evidence to support their claims, and so people will continue using salvia for recreational purposes. These people will be charged and so the drain on our judicial system and our prison costs will increase. The criminals who sell the substance will have no legal recourse to overcome disputes, and street violence will increase.

The only benefit of banning salvia is that some overzealous police, frightened parents, and impressionable government officials will sleep more soundly thinking they have done the right thing. These flippant benefits are greatly outweighed by the overall cost to the country.

I do not want my tax dollars going towards wasted police efforts on controlling a substance that the general population does not want controlled. I do not want criminals profiting on drug revenue without paying taxes. I do not want young people being treated as criminals for experimenting with drugs. I do not want organized crime continuing to create violence in our cities, while our own laws essentially fund their source of revenue.

If you want to perform a study on the effects of salvia, please send my tax dollars there. If you want to promote educational resources to inform young people in Canada about the statistically-supported health risks of recreational substances, send my tax dollars there. If you want to fund services providing rehabilitation to the minority of drug users who are overcome by addiction, send my tax dollars there.

Do not add salvia to the CDSA. There is no logic behind it. This is a knee-jerk decision brought on by our irrational fear of any substance that is used recreationally. This fear has been causing bad political decisions for decades, so please do not add another bad decision to the list.

Thank you.

**Notice to interested parties – Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act**

[redacted] to: OCS.Policy.and.Regulatory.Affairs 2011-02-22 09:40 PM

Dear Stephanie Chandler,

I'm would like to be made aware of any future actions or consultations pursuant to the "Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act". **s.19(1)**

Personally I oppose adding this plant to Schedule III. I do not believe that such an action will increase the safety of the public, or youths. Instead, as is clear from other related Schedule III substances, such action will simply foster an illicit trade in the plant and it's derivatives, which will expose the public and youths to greater threat, and the increased possibility of this substance being contaminated with other drugs and chemicals before hitting the streets. It would be considerably more harmful to the general public if the availability of this plant were to become the sole purview of organized criminals involved in illicit drug trafficking. Moreover such action is likely to increase the strain on the criminal justice system, therefore also the public tax burden, and both needlessly and irreparably tarnish the prospects of any parties, particularly youths who are thus convicted.

Lastly, this plant is a visionary medicine held sacred by many indigenous peoples of Central and North America who have millennia of tradition surrounding it's use in ceremonial/initiatory processes. While I agree that reducing it's availability to minors is desirable, I think that overall, the risks involved in legislating around that, are far greater than any potential harm which the plant poses to the public under current the law. Since it has been clearly cited in the text of this consultation that the effects are both very short-term, and can often be unpleasant, I feel that alone provides sufficient deterrent against it's use. Rather than legislation, what is instead called for is appropriate labeling, and liability on the part of distributors. Together with education concerning the history and appropriate (sacred) context of using this plant, any perceived harm can be easily and readily avoided.

Regards,

--

[redacted] From a VERY concerned person...

[redacted] to: OCS.Policy.and.Regulatory.Affairs

2011-02-22 10:58 PM

Hello,

After hearing about the plans to completely disregard peoples freedom and spiritual beliefs in Canada my heart began to ache and my emotion flared. I have never heard such unsympathetic closed-minded nonsense. Yes, I'm speaking about *Salvia divinorum* "The Teacher Plant" that has gained a reputation by those who do not take the time to learn about it... For those who are the same people that allow cigarettes and alcohol to destroy the lives and kill millions of people annually, its hard to understand how a plant so useful and entirely harmless when used properly

**s.19(1)**

can become illegal. May I ask why? It IS NOT a burden on society neither financially nor ethically, it is completely non addictive, in fact many can work with the plant once, heal addictions, mental distress and emotional turmoil and then never have the urge to use it again. I feel so unbelievably frustrated and confused by what is happening to Canada... The freedoms of spiritual growth that once were accepted and maybe taken for granted are now being pummeled with fascist thinking and the efforts to put money before societies well-being. Salvia divinorum is not a problem in our country, that is a fact; there are millions of plants that are useful when used properly and i fear that this action to outlaw Salvia divinorum is not only a big mistake because it is such a useful plant but it will also lead to the destruction of all natural products allowing room for the pharmaceutical companies to corner the market in what they call 'healing' which is not healing, it is masking and multiplying the problems for greedy purposes... but that is a different story... my point is; if the Government is allowed to make a judgement call on something they know NOTHING about then we have lost all rights to religious and spiritual freedom and the right to use nature to heal our own bodies both mentally and physically. And to me... That is scary!

My heart is hopeful that someone comes to their senses and remembers that CANADA IS FREE!!!

Thank you,

Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act

[REDACTED] to: ocs.policy.and.regulatory.affairs

2011-02-23 12:42 AM

Dear Ms. Chandler,

I am writing you because I am concerned about the proposed ban on Salvia Divinorum. As part of a

s.19(1)

university project, I researched Salvia Divinorum quite extensively. I would be happy to provide you with detailed research and references at your request, but for now I assume you are pressed for time, so here are some brief points and concerns:

-I realize that a very small percent of the population have used Salvia. My research finds that an exceptionally small portion ever use it more than once and an even smaller number use it with any regularity. How many reports of addiction or abuse have you come across? Do you know of any hospitalizations resulting from Salvia use?

-I believe that banning this substance will not reduce use. A small market will still exist for the plant and people will still trade in it, without any taxation. People buying it on the black market may be presented with options to obtain more dangerous substances from the black market suppliers. Banning the plant may also increase the allure of it to some. Some occasional users will use other illegal substances instead, which may or may not have a better safety record, while others may use legal though remarkably dangerous intoxicants such as aerosols.

-I think the social and economic costs of the criminalization of users will far outweigh any benefits. What do your calculations indicate?

-Though I am not aware of any current research underway in Canada, I do believe this plant should be explored for therapeutic/medicinal potential.

Having mentioned all of this, I must say that I do think sales should be restricted to persons over the age of 19 and perhaps there should be some labeling requirements detailing harm-reduction approaches to use.

I urge you to reconsider this ban.

I eagerly await your response.

Sincerely

2011-02-23 08:27 AM

It has come to my attention that the plant known as *Salvia Divinorum* (*Salvia*) is being considered to be added to the Controlled Drugs and Substance Act scheduling.

I am lodging a protest against *Salvia* being added to the Controlled Drugs and Substance Act scheduling.

**s.19(1)**

As mistakenly portrayed in the Canada Gazette, salvinorin A is not a substance that is like those found in Schedule III of the CDSA because salvinorin A is not an alkaloid.

Being an adult of sound mind and body, I recognize that Salvia can be potent. The statistics portrayed in Canada Gazette is not scientifically principled because use in of itself does not constitute a threat. The Canada Gazette statistics does not illustrate the potency of the Salvia consumed, nor does it statistically correlate it to any theoretical toxic effects such as organ damage.

Finally, a legal adult substance cannot be banned simply because it is used in a disrespectful manner by troubled youth.

Hello,

I don't have the time to write a lengthy email with all the information to back up my opinion. But my opinion is this: Banning salvia is unnecessary.

I am speaking for thousands of other people out there as well. The claim of lack of knowledge about long term effects is bogus. "You" simply have a problem with people (and more specifically, youths) experiencing "hallucinations". I may be wrongly assuming this, but I believe that the

people who are making decisions here have never attempted salvia and base much of their "knowledge" on external observations of the affects of salvia. It is a drug that causes no physical harm, and only causes people to learn more about themselves and the world, as well as allowing the people to experience intense wonder and to simply enjoy themselves.

Sincerely,

s.19(1)

Dear 

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Stephanie Chandler

**Dep. of Health Notice. Feb. 4, 2011**

 to: ocs.policy.and.regulatory.affairs

2011-02-24 03:29 PM

Dear Ms./Mrs. Stephanie Chandler

We write you today in response to the bulletin posted February 4, 2011 on the Canadian Gazette titled: Notice to interested parties – Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act*

After reviewing your notice and also going through some texts on this particular member of the Sage family I have some serious concerns about it being scheduled in Canada. We have little reason to disagree with somehow controlling the sale of purified psychotropic substances, such as Salvinorin A, we feel it would be against Canada's best interest to further ban and consequently prosecute Canadian citizens for the plant itself.

In the notice, we get the impression that that the health risks were so far not understood, or perhaps misunderstood, and there was concern for youth using psychotropic substances. In studies done in labs on rats, and also through contacting various retailers, it would seem that physical health risk are quite limited, if not completely unheard of. The greatest risk to ones self appears to be harming ones self while intoxicated. Reviewing the reports of people under the influence of Salvinorin A, mobility is greatly impaired, making very dangerous acts such as driving quite impossible. Relative to other psychotropics that last much longer and act on the body in a way that allows one to get around easier, there seems far less room for concern with this particular substance. The fast onset of the effects, and the short duration make it a difficult substance to take to public arenas such as bars, concerts or other common places people may take up such activities.

Reading off the DEA's website in the United states, they claim that "Salvia divinorum most likely will not become widely abused" (DEA 2003). Due to this substance being quite non-addictive (Kappa opioids are negatively reinforcing, which make them very difficult to become addicted to), and the effects of the substance being of a very non popular flavour (which seems to result in people unwilling to continue use), habitual use seems incredibly low by any measure.

In a report testing Salvinorin A on rats, Mowry et al. showed that 6.4 mg/kg/day of salvinorin A by intraperitoneal injection in rats for two weeks produced no fatality or toxicity, and when the rats were autopsied, no changes were noted in their organs or tissues. To our knowledge no such toxicity or damage to the organs, including the brain, have ever been published or mentioned in the literature.

We see in your notice, perhaps the biggest concern is youth using Salvinorin A for its psychotropic effects. This we feel compelled to agree with a controlling of the substance not unlike alcohol and tobacco where there is an age requirement. Or even perhaps just banning the extracted substances, and exempting the plant itself, much like I see the Controlled Substances Act has done with mescaline and exempting the live plants.

We believe, and have found to be the case in many other nations we have traveled to and collected plant species for study, that when any species and any part of that species becomes banned outright, there is a few ill effects placed upon that nation. When actual plants are banned, there are far more people who may be included in the "criminal" category, and indeed in some nations they are imprisoned for having such plants without manufacturing or distributing them. Aside from this being devastating on the citizens of the nation, it also costs quite a Lot to deal with criminals in our society. I have witnessed this in Malaysia and China for example, both of which ave similar policies with banning a species and everything related to it, no matter what. I also notice that nations that tend to ban substances that may be obtained from plants, but leave plants themselves alone, tend to have a far more workable prison system and the costs associated with it are far fewer. One such example would be Portugal.

We have no specific quarrel with protecting youth and keeping substances that intoxicate them away from easy access. We have very deep concerns about making plants outright illegal for the average Canadian citizen to grow in their gardens and on their windowsill, or for a university or medical research centre to be able to cultivate the plant and preform studies on them. It is quite important for us, as citizens of a nation that is such a role model of freedom and human rights, to not be prosecuted for growing Sage and risk imprisonment and loss of freedom and lose the privilege to travel to other nations due to a criminal record based on growing a Salvia species. We urge you to consider the research already done by universities, private researchers and consider our freedoms and rights as Canadians and what may be at stake. We feel very fortunate to live in such an open and free country where we can voice our concerns and be heard by our leaders. It gives us all a great sense of accomplishment and pride to be able to say to people that we do have a say in what freedoms we may enjoy, and that our leaders will listen to us and use their best judgment in deciding what is truly best for the people and does not interfere with what we stand for; Glorious and free.

We are currently in [REDACTED] therefor, we will not return to back Canada for another few months. We would, however, like to be kept informed of any progression of this notice, and anything related to it. If you have a mailing list for this, or some other means of staying informed we would very much appreciate it.

Sincerely,

[REDACTED]

dear reader.

i have learned that salvia may be soon regulated. i cant believe Canada is thinking about this, its already a Natural Health Product, that's good enough, don't make salvia illegal that's foolish. shamans using this

magical plant for centuries and soon as us westners get ahold of these plants, they become prohibited.

please, don't make salvia illegal. it doesn't hurt the body or the mind. just keep it as a NHP or put age  
limit on it. DONT make it illegal for canadians, PLEASE!!

peace,

**Consideration of Salvia Divinorum addition to Schedule III of the CD&S Act**

[REDACTED] to: ocs.policy.and.regulatory.affairs 2011-02-25 03:28 PM

I wanted to include my opinion as a taxpayer and citizen in this issue. Please understand that by reading this, you will be exposed to facts that you may currently be unaware of. Many of these can be substantiated by adults who respect and understand salvia divinorum. Unfortunately, there is a tendency to pigeon-hole such individuals as "users", thereby generalizing them with a pre-established bias and rendering their testimony invalid. This is unfortunate, as they are in actuality the only ones who have a working knowledge of the "other side of the story", and some of the tangible spiritual or symptomatic healings and changes that can occur through responsible and respectful use of this plant (not as some

kind of "legal high", but in keeping with its revered nature in its historical origins).

If one does some respectable online research on the topic of salvia divinorum (i.e.- wikipedia or sagewisdom.org), they will discover that its original use was as a spiritual/religious tool by shamans, who act as intermediaries between the spiritual and physical world. This plant has traditionally been used in healing rituals and vision questing, to restore spiritual balance and promote healing on all levels. However, recent mass-media has drawn attention to the ABUSIVE component ONLY of this plant, which is not balanced by the accounts of those it has helped (since these stories can't compete with the sensationalism of their counterparts). As a result, there is a media-produced subjective bias, where the other side of the story is essentially untold - those who have benefited from salvia - either as a spiritual tool, an herbal treatment for migraine headaches, an antidepressant, or a plant that miraculously delivers people from substance addictions.

Quoting from Wikipedia, " Media stories generally raise alarms over Salvia divinorum's legal status and are sometimes headlined with generally ill-supported comparisons to LSD or other psychoactive substances. Parental concerns are raised by focusing on salvia's usage by younger teens—the emergence of YouTube videos purporting to depict its use being an area of particular concern in this respect."

If you discuss this with mature adults who have some first hand knowledge of salvia divinorum, you'll probably find that they all agree that minors should NOT have access to it. Furthermore, you may learn that the salvia divinorum plant and its leaves are NOT what is being abused - but this fact is rarely brought to light. Salvia divinorum abuse is *entirely* due to "chemical enhancement", creating what is known as "salvia extracts". These are between 5 and 80 times the potency of a naturally occurring salvia plant, and THESE are the problem with the "more is better", "faster is better" mentality of teenagers that have become widely advertised by the media (although granted, many of them find the experience highly unpleasant and don't opt for a second try). The vast majority of people have absolutely no effect when they try "plain" salvia leaves, and this is precisely why the "chemists" set forth to concentrate the active chemical and repackage it for profit. These "extracts" are what NEEDS to be illegal, as there are other health risks that are created when these are produced - potential for contamination during the chemical process, chemical residue, additives, as well as hazards inherent to the process (fire and explosion hazards, harmful vapours). Banning salvia plants and "plain leaves" outright is akin to Health Canada banning coffee beans on the basis of Online Videos that show a highly concentrated dose of caffeine triggering a seizure or a heart attack. Perhaps lemon balm or herbal teas will be next after that. At any rate, it would be severe overkill, and it would be fundamentally wrong to make it illegal for those adults who may use the natural, unaltered form of salvia as a tool in a spiritual context as a meditation aid, violating their freedom to practise a part of their religious beliefs.

Having a large family with a number of children, I am highly in favor of protecting minors, and believe that the sale of salvia, like alcohol, should be regulated - and sale to minors strictly prohibited and enforced. Furthermore, there are SIMPLE additional measures that can be undertaken that promote responsible use of this plant - primarily banning the sale and/or possession of "extracts" (read as concentrated via unregulated chemical processing), which are the actual culprit here. The plant itself, in its unmodified form, is simply not the problem. Subsequent research or polls would demonstrate and substantiate this fact. Creating another "scheduled plant" as a "responsible measure" after a certain media event (who are we kidding here, we all heard about Miley) to alleviate public pressure isn't the kind of insightful and objective leadership that we as Canadians need. What we need is for Health Canada to propose a solution that addresses the real problem, not one that simply panders to public reaction and fear-mongering media hype without statistics that CITE some actual health problems. Objectivity promotes respect. Unchecked fear and misinformation breeds poor decisions and poor legislation (in this case, that the infrastructure likely can't even support and enforce, if it were an across-the-board prohibition).

If you create laws that ban the sale of salvia to minors and the possession/sale of all Salvia Divinorum extracts, and you will SOLVE the problem while preserving something that's sacred to most Canadians -

**s.19(1)**

the right for adults to make informed, self-respecting choices. And while we're at it, let's keep coffee beans legal. Canada is a forward-thinking country - so wouldn't it be best to take the lead and set a global example of "setting the stage for honouring adult choices", instead of returning to the dark ages with knee-jerk reactions that respond to what amounts to nothing more than public ignorance based on media sensationalism?

Thank you for taking the time to consider this information. I would be glad to clarify any points herein, if it would be of assistance in creating an informed and thoughtful background for understanding the facts regarding this issue.

**Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act**

[REDACTED] 2011-02-26 05:48 AM

Cc: OCS.Policy.and.Regulatory.Affairs

Hello,

I have concerns about the proposal regarding the addition of Salvia divinorum and salvinorin

A to Schedule III to the Controlled Drugs and Substances Act.

Taken from: Canada Gazette

<http://gazette.gc.ca/rp-pr/p1/2011/2011-02-19/html/notice-avis-eng.html#d109>

"Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15-year-olds have used *S. divinorum* in the past year. Moreover, the *2009 Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year."

When you ban a substance this does not mean the problem will go away. If you look at the same age groups what percentage of population uses highly addictive and dangerous drugs such as alcohol and tobacco? Prohibition has never worked so why do you plan on trying it again?

Another fact from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 76.5% of Canadians aged 15 years and older reported having used Alcohol.

Also in same survey "three quarters of youth (75.5%) reported consuming alcohol in the past year." I do not know of a death from the use of *Salvia divinorum* or *Salvinorin A*. I wish I could say the same for alcohol and tobacco.

Taken from: *Canadian 2008-2009 Youth Smoking Survey*

[http://www.hc-sc.gc.ca/hc-ps/tobac-tabac/research-recherche/stat/survey-sondage\\_2008-2009/result-eng.php](http://www.hc-sc.gc.ca/hc-ps/tobac-tabac/research-recherche/stat/survey-sondage_2008-2009/result-eng.php)

"For youth in grades 10-12 however, the 13% of youth who reported that they were current smokers was a statistically significant increase from 2006-07 when the rate was 11%."

Taken from: *2009 Ontario Student Drug Use and Health Survey*:

[http://www.camh.net/Research/Areas\\_of\\_research/Population\\_Life\\_Course\\_Studies/OSDUS/Highlights\\_DrugReport\\_2009OSDUHS\\_Final\\_Web.pdf](http://www.camh.net/Research/Areas_of_research/Population_Life_Course_Studies/OSDUS/Highlights_DrugReport_2009OSDUHS_Final_Web.pdf)

**Cigarettes:** Cigarette smoking is by far the greatest public health issue impinging on a population's health, as it is the leading preventable cause of disease. Although student smoking has decreased over the decades, there is still a significant proportion (one-in-eight) that does smoke (about 119,600 students). Further, the decline in smoking seen in previous survey cycles ceased in 2009, as the rate remained stable.

Contraband cigarette smoking is reported by 6% of students (about 60,000 students). Among only past year smokers, over half (53%) have smoked contraband cigarettes in the past year.

**Alcohol:** Binge drinking still remains at an elevated level, as just over one-quarter (25%) of all students reported drinking at least 5 drinks on the same occasion once in the past month.

**s.19(1)**

When we look at the 12th  
-graders only, this  
proportion becomes half (49%). One-in-five  
students (21%) drink hazardously in that their  
drinking puts them at risk for current or future  
physical and social problems. Indeed, one-in-ten  
(10%) students report being injured or injuring  
someone as a result of their drinking in the past  
year

Lets be honest here. Salvia divinorum is not a problem. If you ban Salvia members of the  
Canadian population will end up with a criminal record for nothing other then an expense to tax  
payers.

Thanks,

s.19(1)

**Salvia legal status**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-02-28 01:26 PM

I hope the following points are part of your deliberations concerning the proposed criminalization of *salvia divinorum*:

People like myself who have chosen to use this plant will, with the stroke of a pen in Ottawa, become criminals, with all the heavy consequences that entails for the individual, as well as the extra burdens placed on the criminal justice system. While respectful of the law generally, I

**s.19(1)**

will not obey a law that prohibits my use of a plant I consider a godsend.

I could argue the virtues of salvinorin, but that would just confuse the issue, as well as possibly confounding the reader who might have no interest in arcane subjects like the nature of reality and how this drug might illuminate such matters. The issue is whether this drug causes harm, and causes enough harm that criminalizing its use is justified, and whether criminalization will achieve the desired aim of eradicating its use.

As the research indicates, there are no known negative health effects in users, and no addictive potential. The only potential safety risk is from the drug's impairment of motor control, but because the drug effect is so short-lived, and doesn't typically motivate people to move around anyway, this risk is moderate at worst. Because the effect is so intensely disorienting, most people will never want to repeat their first experiment with the drug, which places a hard limit on its potential for widespread abuse.

Just as some people will strongly disapprove of any and all "psychedelic" drugs, others will be attracted to their aura of risk and non-conformity. I contend that making this drug illegal will do nothing to dampen that attraction, and isn't likely to reduce its availability. Salvia is easy to grow and easy to transport (as a concentrated extract), and because of its high profile due to widespread media coverage, it would become part of the stock-and-trade of drug dealers, and the state's interest in controlling its use would be thwarted.

Tighter regulations and enforcement governing Salvia's legal sale could do as much or more towards reducing its casual use ( especially by youth ) than criminalization, as opposed to the state issuing a blanket prohibition against personal use, which, apart from its questionable effectiveness, would arguably amount to a denial of individual freedom. This is, above all, the issue that I would hope is uppermost in your review of this, to me, very important legislation.

Thank you for your attention,

2011-02-28 11:04:22 PM

**Re: Proposal To Ban Salvia divinorum**

[REDACTED] to: ocs.policy.and.regulatory.affairs, Jay LeBlanc

2011-02-28 11:04 PM

Greetings!

[REDACTED] I have been working at a full time job since graduating from university and college. I pay my taxes like every law abiding citizen, and I have never faced any legal troubles. I have never been in a fist fight, I have never broken a bone or needed stitches, or had a cavity, nor been hospitalized for any reason. I believe I qualify as a healthy, thoughtful individual. My health can be attributed both to my wonderful country, which has supported my growth, and to my own intelligent choices, which I make every day. The support of my country has allowed me, in turn, to work, so that I may support other honest people in this

s.19(1)

country. Despite my love for my country, Health Canada is recommending that people like me be deemed criminal.

I was deeply saddened to read from the Canadian Gazette, "Proposal regarding the addition of *Salvia divinorum* and salvinorin A to Schedule III to the Controlled Drugs and Substances Act". I have used *Salvia divinorum* for several years and have suffered no negative effects whatsoever. On the contrary, my *Salvia divinorum* use has been one of the few things in my life which has truly been therapeutic on a number of levels; psychologically, socially, and spiritually. The meditative states achieved through unique plants, such as *Salvia divinorum*, have motivated me to be a better worker, to become closer to my family, and be a more caring individual. This is why it saddens me deeply that the people of my country are considering making *Salvia divinorum* a scheduled substance, which would, in effect, make me a criminal... because I use this plant of my own free will for legitimate therapeutic and spiritual purposes. I gave personal background on myself in the first paragraph, in to make clear the type of person that Health Canada is considering criminalizing. I cannot help but feel that Health Canada is considering a proposal that says, "Proposal regarding the addition of [REDACTED] and anyone like [REDACTED] to Schedule III to the Controlled Persons and Citizens Act".

Health Canada does not seem to consider the people who use this plant, or the benefits that some people have gained from its use, nor the consequences of its proposed new legislation. Why is that? The maximum sentence for a person possessing a schedule III substance is three years in prison. Would it really be better to have me in prison than to have me be a working member of society just because I use *Salvia divinorum*, and benefit from it? If convicted of *Salvia divinorum* possession, instead of paying taxes, the people of Canada would pay taxes to pay for me, as I waste away in prison, and use up legal resources. Also, as a fiscally conservative Canadian, I am concerned about the potential costs of enforcing a needless law against *Salvia divinorum*, and as a caring citizen, I am concerned about the lives that would be damaged as a result of the proposed law. This proposed law is coming out at a time when Canada is facing criticism for overcrowded prisons, and overused justice system. Crime rates are reported to be decreasing, yet incarceration rates increasing. This makes no sense and is a very disturbing trend because it suggests that the criminal justice system is beginning to be used in a way that affects non criminals. I would like to think that the justice system should be reserved for those who do harm to others, for those who do harm to their country. No evidence has ever been provided that users of *Salvia divinorum* pose any such threat, certainly not a threat requiring a punishment of three years in prison.

Health Canada suggests that *Salvia divinorum* may be a threat to public health and safety, but do they provide any evidence for this? Has Health Canada also done a study on the threat to health that potential prison time might do to a person? I could not imagine the damage prison would do to my life, and my family's life, if I were to be jailed, or even charged for possessing a schedule III substance. Even a conviction without jail would result in job loss, and make it very difficult to find meaningful employment. That is worse than anything *Salvia divinorum* could ever do. I strongly urge Health Canada and anyone involved in the push to criminalize *Salvia divinorum* users, to consider very carefully the potential harm that the law could impose on honest people.

Yet, despite the severe cost that would accompany being charged with a schedule III substance, I cannot consider the potential penalty as a deterrent. I honestly and truly consider *Salvia divinorum* use to be a personal sacred spiritual practice. It would not matter if the punishment for using *Salvia divinorum* were 3 years, or a hundred years, or death. I would only consider the threat of prison to be a potential disaster to my life, just like a horrible car accident, or being kidnapped or murdered. Yet, I do not allow the possibility that I may be injured by harmful people stop me from living my life. I cannot let those possibilities stop me from being who I am, from living a peaceful and productive life, and expressing my right to freedom of conscience and religion, freedom of thought, belief, opinion, and expression. If arrested for possession of *Salvia divinorum*, the only lesson I would learn is that the people of my country are willing to destroy me for being who I am, and making my own choice. I cannot support such intolerance, nor would I want any young person to support the idea that people should be imprisoned for

making their own choice. There is a threat to youth out there, and it is the promotion of a system of intolerance and inhumane conditions intended for criminals, yet used on non criminals. It would be irresponsible of Health Canada to impose the potential disastrous effects that its proposed law may have on the citizens of Canada.

I beg you to please find an alternative to making *Salvia divinorum* a schedule III substance. I want to continue to be a productive member of society. I wish to reach out to those in power, and try to offer some kind of assurance that not every user of *Salvia divinorum* is a danger to themselves, and many people also use this plant as a spiritual practice. I feel there is a strong negative stereotype against users of a variety of substances. I am just a regular hard working person who doesn't want to go to prison! Please, hear this cry for tolerance and mutual co-operation. I hope to avoid a conflict with the law, and I hope those in power find a way to avoid clashing with its own citizens. Surely, there must be a much less violent way to deal with this *Salvia divinorum* issue than scheduling *Salvia divinorum*. I do not want to be an enemy of the state. I have no desire to break any law. I don't want to be a rebel, nor a martyr. I love my country, and humbly ask for understanding and tolerance.

I have heard blanket arguments against *Salvia divinorum* such as "the effects are unknown", or "the federal government supports families by protecting the children from the hallucinogen, *Salvia divinorum*". Yet I see little in the way of evidence of actual harm done from *Salvia divinorum*, despite its presence in Canada for about twenty years. Does Health Canada and the federal government forget that people who use *Salvia divinorum* have families too? Why is there an assumption that people who use *Salvia divinorum* are somehow anti-family? Why does Health Canada seem to assume that families of people who use *Salvia divinorum* are deserving of punishment and inhumane treatment in the environment of prison? I consider Canada to be one big family. I see no reason why *Salvia divinorum* users and non users can't mutually co-exist without incarcerating each other, or hating each other. I hope Canada chooses to send a message to the world, that while it will do everything in its power to protect underage people from using mind altering substances, Canada will also not destroy the lives of its own citizens, and *their* families by putting more people in prison for meditative plant use. If I want to protect my children from anything, it would be protecting them from becoming hardened, uncaring adults who are willing to imprison any adult who makes their own choice.

I encourage legislators to consider alternatives to scheduling *Salvia divinorum*. According to this CBC article, from October 2010, <http://www.cbc.ca/news/health/story/2010/10/19/salvia-banned.html> "the federal government says products containing *Salvia divinorum* and its active ingredient, salvinorin A, are considered natural health products and, as such, must be authorized by Health Canada before they can be sold."

If that is true, it does not necessarily follow that *Salvia divinorum* must be scheduled. There must be another way. That is to say, just because Health Canada does not approve of a substance being sold as a "natural health product" does not automatically mean the substance should be scheduled. The federal government does not have to classify *Salvia divinorum* as a "natural health product", and the federal government does not have to schedule *Salvia divinorum* just because Health Canada does not approve *Salvia divinorum* as a natural health product. I am sure, or at least I certainly hope, that cigarettes are not approved by Health Canada, yet they are still legally sold in Canada.

The federal government has allegedly chosen to classify *Salvia divinorum* as a natural health product, however, *Salvia divinorum* is not sold as a natural health product. The following is quoted from the "Food and Drugs act: Natural Health Products Regulations", which can be found here, <http://gazette.gc.ca/archives/p2/2003/2003-06-18/html/sor-dors196-eng.html>

"natural health product" means a substance set out in Schedule 1 or a combination of substances in which all the medicinal ingredients are substances set out in Schedule 1, a homeopathic medicine or a traditional medicine, that is manufactured, sold or represented for use in

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or

(c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health."

*Salvia divinorum* is not marketed as a "natural health product" and I can prove it. In my letter I have attached a jpg file which shows the cover of a "Salvia Zone" product, which I bought at a local store in Ontario. Salvia Zone is one of the most popular vendors for packaged *Salvia divinorum* sold in stores, which is where people have most easy access to *Salvia divinorum*. The package comes with detailed warning messages. One of those messages expressly states that the salvia product is "not intended to diagnose, treat, cure, or prevent disease". There is also nowhere on the disclaimer that suggests the use of salvia modifies organic function in a way that maintains or promotes health. In fact, the disclaimer warns that all inhaled smoke of any kind may be harmful to health. Therefore, it is incorrect to classify *Salvia divinorum* as a "Natural Health Product" because vendors of Salvia products do not market their product in a way that are represented for use in the diagnosis, treatment, or prevention of disease, as outlined by the "Natural Health Products Regulations". As such, *Salvia divinorum* should not require the approval of Health Canada in order to be sold.

If Health Canada is concerned about *Salvia divinorum* being used by those who are underage, I implore Health Canada and the federal government to devise stricter regulations regarding the selling of *Salvia divinorum*, which would limit its access to minors, while allowing *Salvia Divinorum* to remain legal to possess for consenting adults. Scheduling *Salvia divinorum* potentially places innocent users of *Salvia divinorum* at risk, users, like myself, who have absolutely nothing to do with selling *Salvia divinorum*, nor giving it to anyone, nor promoting it to anyone. I have no interest in promoting *Salvia divinorum* to anyone. People are free to abstain from salvia use, if they are under the impression it is somehow a risk to their health, and *Salvia divinorum* shows low potential for addiction. Charging a person like me for *Salvia divinorum* possession would do absolutely nothing to protect minors from using *Salvia divinorum*, as I have no intention of selling, nor giving *Salvia divinorum* to anyone. Furthermore, scheduling *Salvia divinorum* may pose increased risk to users, including minors. Users who would continue to use *Salvia divinorum*, despite the law, would be forced to acquire salvia from illegitimate sources. This places the user at risk, as they have no idea if they are getting a clean product. Sellers may lace their "salvia" product with any number of other substances, such as pcp. This poses a threat far greater than *Salvia divinorum* on its own.

In the past, Canada has made accommodations for those who use plants as part of their spiritual practice. Mescaline is a controlled substance in Canada, yet Peyote, a plant containing mescaline, has a specific exemption from the Controlled Drugs and Substances Act, found at , <http://laws.justice.gc.ca/eng/C-38.8/page-6.html>  
"17.

Mescaline (3,4,5-trimethoxybenzeneethanamine) and any salt thereof, but not peyote (lophophora) The exemption of Peyote from the Controlled Drugs and Substances act is an appreciated gesture of respect to accommodate those who use the plant ceremonially. There are people, such as myself, who also use *Salvia divinorum* for similar purposes. I ask that if salvinorin A were to become scheduled, please allow for the continued legality of the plant itself, *Salvia divinorum*, in a similar fashion that that Peyote is exempt from the Controlled Drugs and Substances Act.

A similar action with regards to *Salvia divinorum* would be very appropriate and for a number of reasons. First, this would prevent the selling of dried leaf extract in stores, which is the most common place for people to buy *Salvia divinorum* products. The potential strong psychoactive effects of *Salvia divinorum* products are the result of the active compound, salvinorin A being condensed on to plain leaf. This is known as "fortified leaf". This is why salvia products are almost always sold as a value of X, for example, 5x, 10x, or 40x or some claim even high concentrations. A fortified leaf sold as 40x means that the leaf in the 40x product is supposed to contain 40 times the amount of salvinorin A that would be found in plain leaf of the same weight. The amount of salvinorin A in plain leaf is not enough to produce the same type of strong effect that fortified leaf produces. If dried extract were banned in stores, yet the plant, *Salvia divinorum* still permitted, people would still have access to the sacred plant, while not being exposed to

strong concentrations of the active compound salvinorin A, which is concentrated in fortified leaf preparations. The live plant cannot be smoked, and unfortified dried leaf does not produce the same strong effect as fortified leaf.

Furthermore, the traditional use of *Salvia divinorum*, originally used by Mexican natives was to chew the leaves, not smoke the leaves. Chewing the leaves is often referred to as "the quid method", in which *Salvia divinorum* leaf is placed under the tongue, and the active compound is absorbed through membranes under the tongue and mouth. The effect of this method is very different from smoking, and drastically less intense. The reason for the decreased intensity is because only a small amount of the active compound can be absorbed through the mouth for any period of time, thus limiting the amount of inebriation a person can experience. In contrast, inhalation of concentrated amounts of salvinorin A, such as found in fortified leaf, enter the blood stream and reach the brain within a matter of seconds, and is metabolized in a matter of minutes. The result can be a strong alteration of consciousness. However, the traditional use of *Salvia divinorum*, which is to chew the leaves, simply cannot produce such drastic alterations of consciousness. Any person curious about this can easily test this assertion for themselves. The result of chewing *Salvia divinorum* for an hour will result in a mild-medium meditative state in which imagination is stimulated. There will never be a case of videos showing Miley Cyrus acting crazy on chewed *Salvia divinorum* leaf, nor videos of any Saskatchewan dj acting hysterical after chewing *Salvia divinorum* leaf. Chewing *Salvia divinorum* leaf simply does not result in the sudden and strong change of consciousness that results from smoking. However, chewing *Salvia divinorum* is the traditional form of usage, which is used primarily by myself, and in traditional ceremonies. Chewed leaf of *Salvia divinorum* will never be a popular drug of choice for anyone seeking a thrill. The leaf tastes bad and becomes uncomfortable after a few minutes. Chewed *Salvia divinorum* is only useful for those who wish to meditate and learn. For these reasons, the plant *Salvia divinorum* should remain legal. However, if Health Canada believes that inhaling concentrated forms of *Salvia divinorum*, such as the fortified leaf sold in stores, then I see no harm in reducing the availability of fortified leaf to the population by banning the sale of fortified leaf. But I do see harm in banning the plant itself, in criminalizing all users. Please, keep the plant itself legal.

I have seen very little evidence provided from Health Canada that would suggest that *Salvia divinorum* is a dangerous drug. Furthermore, *Salvia divinorum* use has declined from 2008-2009. According to Health Canada's "Canadian Alcohol and Drug Use Monitoring Survey: Summary of Results for 2009", (Health Canada's most recent published Summary of Results) *Salvia divinorum* use declined from 2008-2009. Why is Health Canada choosing this time to propose a ban on *Salvia divinorum* if its use is declining, and the public has not faced significant risk? The following quote is from Health Canada's "Summary of Results for 2009":

"The rate of past year hallucinogen use (including salvia) in 2009 at 0.9% was statistically significantly lower than the rate of 2.1% reported in 2008. Statistically significant declines between 2008 and 2009 in the rate of past 12 month hallucinogen (including salvia) use were also apparent among males (3.3% versus 1.1%, respectively) and youth (10.2% versus 4.4%). Similarly, past-year use of at least one of five illicit drugs excluding cannabis [cocaine or crack, speed, ecstasy, hallucinogens (including salvia), and heroin] at 2.1% in 2009 was statistically significantly lower than the 3.9% rate reported in 2008."

<http://www.hc-sc.gc.ca/hc-ps/drugs-drogués/stat/2009/summary-sommaire-eng.php>

However, after the proposed ban on *Salvia divinorum* has been introduced by Health Canada, sales of *Salvia divinorum* will probably rise, as users fear the substance may become banned, and this will result in people buying quantities in anticipation of the ban. Also, curious people may want to try *Salvia divinorum* after hearing the press that the herb may soon be illegal. The negative press from authority will also make *Salvia divinorum* lucrative to try for "rebels", and everyone knows teens fall in to that category. So, if it was Health Canada's intention to decrease the number of people using *Salvia divinorum*, then proposing this ban was probably not a good idea. However, even if use remains at current levels or increases, there is still a lack of evidence suggesting that *Salvia divinorum* is a dangerous

substance. In fact, evidence suggests that many people who try *Salvia divinorum* do not enjoy it, and thus do not try it again. This may explain the decrease in use from 2008-2009. Making criminals out of users is not an appropriate response to the "possible" threat that Health Canada perceives from *Salvia divinorum*.

Although *Salvia divinorum* is not marketed as a natural health product, there is research being done on the compound, salvinorin A, which suggests that salvinorin A, may be useful in developing medicines helpful in the treatment of Alzheimer's Disease, schizophrenia, chronic pain, addiction, and depression. Scheduling *Salvia divinorum* may prevent important medical research from being done on this potentially helpful substance. Also, current research on the compound salvinorin A, has revealed that salvinorin A is not an addictive compound, not a dangerous compound, and the substance, salvinorin A, may actually be helpful for those wishing to conquer their dependence on truly dangerous and addictive drugs, such as opium and heroin.

Dr. Matthew Johnson, is currently studying salvinorin A at Johns Hopkins Medical School, and submitted a study on *Salvia divinorum* use in November 2010. In this study, Johnson concluded that *Salvia divinorum* and its active compound, salvirnorin A, are relatively non-toxic substances, even in large doses. The compound, salvinorin A activates the kappa opioid receptor in the brain, while other substances, such as heroin and morphine activate the kappa mu receptor. This is an important distinction because while heroin and morphine produce an effect that is euphoric and addictive, activating the kappa opioid receptor via salvinorin A produces an experience that unpleasant for most users, and is thought to have "anti-addictive" qualities. For this reason, it is unlikely that people would become addicted to *Salvia divinorum*, and unlikely to be a substance of repeat use by those simply looking to "get high" because the substance is not pleasant for many people. Furthermore, the anti-addictive qualities of salvirnorin A may be useful in the medical treatment of addiction. The following are quotes from an NPR radio interview between Dr. Matthew Johnson (Johns Hopkins Medical School), Dr. Elena Chartoff (McLean Hospital), and an NPR radio host, Joe Palca. The quotes support the claims I made in this paragraph. The full article can be found here, <http://www.npr.org/2011/01/03/132613641/Scientists-Study-Salvia-Ingredient-As-Medical-Treatment>

"Dr. JOHNSON: Under the conditions of the study, it did appear to be a physiologically safe drug."

"Salvia belongs to a class of drugs that activate something called the kappa opioid receptor. Heroin and morphine also activate opioid receptors, but they activate the mu opioid receptor.

Dr. ELENA CHARTOFF (McLean Hospital): When you activate the mu receptor, like you do with heroin or morphine, you get a euphoric - you get a rush, a high.

PALCA: Elena Chartoff studies opioid receptors at McLean Hospital in Boston.

Dr. CHARTOFF: But when you activate the kappa receptor with a drug, you get kind of the opposite effect, that depressive-like effect.

PALCA: The depressive effect might be used to counteract the mania of manic depression or negate the appealing effects of narcotics as a way to control drug addiction.

"The results suggest that inhaled salvinorin A. was physiologically safe and psychologically well tolerated across the range of doses tested" (doses ranging from low to high).

The full study by Dr. Johnson and Chartoff can be found here,

<http://www.washingtonpost.com/wp-srv/nation/pdfs/salviapaper.pdf>

In that study, Dr. Johnson concludes, "The results suggest that inhaled salvinorin A was physiologically safe and psychologically well tolerated across the range of doses tested" (doses ranging from low to high).

*Salvia divinorum* has a long history of use as a method of spiritual and person exploration. Johnson writes, "Shamas of the Mazatec people of Oaxaca, Mexico have used *Salvia divinorum*, a member of the mint family, for at least centuries in ethnomedical practices including divination and spiritual healings". Since this plant has been introduced to other parts of the world, such as Canada, other people have included the use of *Salvia divinorum* in their spiritual practice. I am one such person. It would be very

cold and uncaring of the people of Canada to not take the spiritual practices of users in to account, not to mention, I believe this would also be a violation of the Fundamental Freedoms, under the Charter of Rights, which states, "Everyone has the following fundamental freedoms: (a) freedom of conscience and religion; (b) freedom of thought, belief, opinion and expression".

The scheduling of a substance should be taken very seriously, because people could have their lives destroyed by the proposed law. I would like to think that Canada would only schedule a substance if necessary. Plainly, *Salvia divinorum*, and its users, have not proven worthy of drastic methods of control, such as those proposed by Health Canada, in which possession of *Salvia divinorum* could result in a three years prison sentence. Health Canada provides little evidence as to the dangers of *Salvia divinorum*. Health Canada does suggest that little is known about the effects of *Salvia divinorum*, however, recent studies, such as those by Dr. Matthew Johnson, suggest that *Salvia divinorum* is physiologically safe. Furthermore, anecdotal evidence, such as that provided by myself, suggest no longer term negative effects from regular use.... and frankly, I am much more comfortable making the decision myself, whether I choose to use this plant, rather than having a law deem me as a criminal for making my own decision. In addition, the plant *Salvia divinorum* has been used by Native Americans for at least a hundred years in divination ceremonies, and thus this plant is clearly of spiritual use. It would irresponsible to schedule the plant *Salvia divinorum*, which would result needlessly in arrests and pain for those who possess *Salvia divinorum*, and the law also discriminates against people who use *Salvia divinorum* for spiritual purposes. For these reasons, Canada must consider alternatives to adding *Salvia divinorum* to the Controlled Drugs and Substances Act.

Thank you,

[REDACTED] Thank you for the note Mr. or Ms. Office of Controlled Substances

Dear [REDACTED]

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

For your information, Health Canada has developed an *It's Your Health* article about *Salvia divinorum* that aims to inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: <http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>

Thank you for writing.

Sincerely,

Office of Controlled Substances/Bureau des substances contrôlées

**Citizen Input: Salvia**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-03-01 01:33 AM

I am very interested in contributing to the discussion of this proposed legal change.

I have noted for some years that Salvia has been available for sale in reputable shops and at a reasonable price in its natural forms.

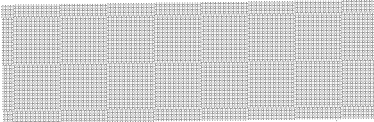

I am a film maker and TV producer. My extensive research on the subject follows nearly 2000 years of recorded use of Salvia and no clearly documented problem, injuries or ill effects directly attributable to the drug.

liquor is controlled (both verified to be infinitely more dangerous and addictive substances).

As a practical matter, the plant is among the most easily grown and cultivated on any windowsill and almost impossible to pick out from any common plantain. It seems to me the pursuit of making the drug illegal now that its place in popular culture is set and widely known would be to make criminals out of thousands of middle-class teenagers and deny people with a genuine spiritual interest an inalienable right to their personal beliefs while costing millions of dollars to solve a non-existent problem.

I am happy to speak on this issue any time.

Sincerely,

A rectangular area of the document is redacted with a dense grid pattern, obscuring the signature and any text that might have been present.

**Concerns regarding Salvia divinorum proposal**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-03-02 08:55 PM

Ms. Chandler,

I would like to take this opportunity as a concerned citizen of Canada to express my objections to the addition of the plant *Salvia divinorum*, its primary active compound salvinorin A, and their

associated unenhanced and enhanced herbal products (hereafter collectively referred to as salvia) to schedule three of the Controlled Drugs and Substances Act. In my view, this is an unfortunate overreaction to legitimate concerns about the use and abuse of salvia by Canadian (and global) youth which, if followed through, will become a serious case of uninvestigated lost potential. I will not pretend that regulation of some kind is not necessary in order to mitigate risk to the public, but I would argue that what amounts to a prohibition is not a good fit for the substance in question.

The article published in Canada Gazette addresses three main concerns with regards to the unregulated status of salvia as follows: "the hype", or salvia's reputation for being sold as a legal alternative to illegal products (notably lysergic acid diethylamide and cannabis, colloquially known as "acid" and "pot"); the similarity of salvia's psychoactive effects to those of substances already controlled under schedule three, specifically citing LSD and psilocybin; rapidly rising use by Canadian school-age youth. (The article also lists ten countries (i.e. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain, and Sweden) that have already regulated salvia, apparently as justification for Canada's proposed ban, though this hardly seems adequate support for any action by a legislative body.) I will discuss these three issues in the context of why the proposed addition to schedule three is a bad fit given these concerns.

Before discussing the above issues in detail, I would like to establish the variance in the profiles of people who make use of this substance today. The group that is obviously of the greatest concern to Health Canada and the citizenship of this and other countries consists of a growing number of youths who abuse this potent hallucinogenic drug. These are kids who are entering into an overwhelming experience ill-informed and ill-prepared. The videos on YouTube depicting teenagers stumbling about and engaging in dangerous behaviour are clearly not depicting safe and cautious use of this powerful substance. I would argue that because such videos are clearly representing substance abuse, it is a fallacy to use them as a gauge for (or source of any information on) the *proper* use of salvia, just as a series of clips on YouTube depicting drunken exploits cannot be used to represent a group of responsible adults enjoying a few beers on a summer afternoon; they can, however, be used to loosely represent the drunks. Along those lines, what we can glean from these much talked about videos is that unsafe abuse of salvia by youth is unsafe, but little else.

It is crucial to recognise that reckless teenagers looking for new ways to get high are not the only demographic making use of salvia. Much unlike their teenage counterparts (who, in my opinion, should be classed as abusers of this drug rather than users), there are people who make use of this substance for medicinal reasons. These are sometimes referred to as being deeply spiritual, or a way of connecting with the world that surrounds us. This is easily dismissed offhand as hippy nonsense and not to be seriously considered, but given that the *Canadian Charter of Rights and Freedoms* stipulates the following fundamental freedoms: "freedom of conscience and religion", and "freedom of thought, belief, opinion and expression", I believe that even these abstract perspectives merit discussion as legitimate considerations. Furthermore, "Every individual is equal before and under the law and has the right to the equal benefit of the law without discrimination", even hippies; to put things another way, even those whose positions may be marginalised, stigmatised, or simply uncommon have a right to be taken into consideration in the making of this new law on salvia. It is for this reason that I feel the government of Canada has a self-imposed obligation to consider the citizens who make honest use of this drug in a safe way for their personal benefit, and I implore you personally to ensure that that obligation be

honoured. Were it not for these individuals, I would wholly support a ban on salvia (excluding availability upon approved request for legitimate research on new uses) as it has proven its potential for abuse by the youth of our country, but because such a ban would thoroughly railroad such individuals, I cannot view it as anything but a way to cut corners.

Other than already marginalised potential for near unquantifiable spiritual use, exploratory research reveals promising results for a variety of treatments with this herb. Because salvinorin A is, at the very least, a relatively nonaddictive opioid receptor agonist, it shows great promise for the treatment of addiction to a very dangerous class of drugs known as the opiates, which include such narcotics as heroin, morphine, oxycontin and other derivatives of opium. In addition, because it acts on these receptors, it has also been touted as having potential for pain management. Preliminary research has also shown salvinorin A to have an antidepressant effect in rats and mice; this research would seem to corroborate surveys which have found that salvia has potential as an antidepressant in human populations. It has even been suggested that salvia could be an effective treatment for certain gastrointestinal illnesses. These are not shady, unfounded theories with potential for alternative treatments that reek of the placebo effect, these are real opportunities that ought to be fully explored for the real opportunity for mainstream use. Far more controversial remedies (homeopathy, for example) have already been approved by Health Canada; one investigation showed that common homeopathic remedies do not contain sufficient quantities of the active ingredient to conventionally explain their effect. Although salvia has its origins in the traditional medicine of the Mazatecs of Mexico, its uses and mechanisms of action are very much conventional medicine, the only thing missing is more thorough research.

Similarly, this lack of knowledge leads to efforts to explain salvia's action in terms we are familiar with, namely as an LSD analogue. Salvia is oft compared to LSD and other similar hallucinogenic substances such as psilocybin which have long been outlawed; almost as a matter of course these comparisons have led to salvia being sold erroneously as legal LSD. Some people will do anything if it means easy money. It is well known and well accepted within the scientific community that the molecular structure of salvinorin A is unique within the domain of hallucinogens, as well as its mechanism of action. Whereas LSD and psilocybin act upon serotonin receptors in the brain and have a more or less typical mechanism of action for hallucinogens, salvinorin A works upon a completely separate set of receptors. LSD and psilocybin are structurally similar (both loosely resembling a serotonin molecule), work in similar ways, and have similar effects of similar duration (twelve hours for LSD, six for psilocybin), so it makes sense to treat them similarly in terms of legislation. Salvinorin A, on the other hand, structurally resembles neither of these nor any other hallucinogen regulated or not, works in a completely separate manner, and has effects which at best are loosely comparable and usually of far shorter duration (around fifteen minutes, given the western habit of consumption by smoking rather than the seldom used traditional methods which give longer lasting but much milder effects, if any). Claims that salvia is a legal LSD are ill founded and at best are founded on claims made by people who aim to directly make a profit off of them, or else are searching for a legal equivalent to LSD, and upon finding something that can perhaps be described as vaguely comparable claim to have found it.

The article published by Health Canada specifically mentions concerns about use of this substance by youth, and proposes a ban to manage risks towards all age groups. As Health Canada's own paper expresses concern almost exclusively for youth, it seems both an

s.19(1)

overreaction and counterintuitive to prohibit this substance across the board. Even if placed in the context of justifiable concern for people of all ages, but especially youth, it does not make sense to add salvia to schedule three as such a ban would be impossible to enforce to anywhere near its full reach and would actually push salvia into the hands of youth and away from responsible adults, researchers, and medical professionals. Numerous sources have agreed that cannabis would actually prove far more difficult for youth to obtain if it were partially legalised, because restricting sale to people aged eighteen or older would be far easier and could be enforced far more effectively than the current ban as well as providing incentive to follow the constraints of legitimacy in selling the substance. Although not comparable in their effects, I believe that this model of inadequacy in legislation can be applied with a considerable degree of accuracy to salvia, which would make the proposed ban counterproductive if anything.

If any risks exist surrounding salvia (and they do), at this point, they stem from ignorance.

Teenagers who abuse this powerful substance do so because they do not fully understand the hazards associated with the kind of dissociative feelings and odd sensations it can produce.

Valid concerns about the long term effects of this substance are due only to a lack of effort on the part of the scientific community to find out what those are, or if indeed there are any at all.

Furthermore, the main worries of the public at large and associated legislative bodies seem have at their heart ill-supported comparisons to drugs like LSD. It seems a waste to me to create a blanket prohibition based solely on a deficiency of good information.

As has been set out in the article in Canada Gazette, “[the proposed ban] is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes”. My hope is only that Health Canada will honour its words wholly and without bias or discrimination. If I may be of any more assistance in this process, please direct any further correspondence to this e-mail address [REDACTED]

**Salvia Law**

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-03-03 02:11 AM

As a salvia user I would like to see that it continues to remain legal. This herb has a lot of potential. Furthermore it is harmless. The effects are 5-10 minutes or less. One would have to be inhaling the smoke whilst doing an activity to have an accident. If protecting the youth is the goal here I propose a law restricting it's sale and use to minors below 18.

Sincerely,

[REDACTED]

**Salvia Divinorum Ban is very concerning**

 to: OCS.Policy.and.Regulatory.Affairs

2011-02-19 04:45 PM

Please respond to 

Hello,

I am very concerned the proposed ban on *Salvia Divinorum* will do more harm than good, as well as take away the choice of adults.

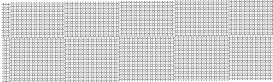

I can certainly understand the concerns about it getting to young people, which is why it makes sense for a ban, such as with cigarettes, to sell to people under the age of majority. However, having taken the substance myself one time, I can assure you that it is not an addictive substance nor one that does anything but commands respect from the user. With responsible use, it can have profound spiritual meaning and depth and allow for insight.

003155

This isn't a party drug. By making it a schedule III substance, it will provide the perfect opportunity for the criminal underworld to take over the trade in salvia divinorum and make sure it gets to young people and is used irresponsibly.

Instead, I would suggest talking with adults versed in both responsible and effective drug policy, as well as those who have a holistic understanding of entheogens. The best way to minimize harm from salvia is to treat it with respect and take appropriate steps that responsible adults are the ones who can make the choice to use it.

Sincerely,

A rectangular area of the document is redacted with a grey grid pattern, obscuring the signature.

Re: Salvia

to: OCS Policy and Regulatory Affairs

2011-03-03 04:25 PM

This is exactly what I was writing **against**:

*Canadians should not use products containing S. divinorum and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body.*

Little is known about the long-term effects. *Little* . Why is it being banned when we don't know about it? Again, please support an evidence based drug policy.

I see that my comment was simply not read at all.

s.19(1)

Hello

As a citizen of Canada, I want an evidence based drug control policy. In order for Salvia divinorum to become a controlled substance in Canada, it should first be shown by Health Canada to be more harmful and addictive than other legal substances like alcohol and tobacco. If a drug cannot be proven to be more harmful and addictive than *legal* substances in Canada, that substance should remain legal. Regardless of personal philosophies, this is merely just logical consistency.

I am not a drug user - I even avoid alcohol. But personal freedoms in Canada should not be under siege without strong scientific evidence. Please support an evidence based drug control policy.

Thanks

Re: Citizen Input: Salvia

to: OCS Policy and Regulatory Affairs

2011-03-03 06:39 PM

Thank you for the note Mr. or Ms. Office of Controlled Substances, I think the article you've shared with me is a fair brief assessment of the current situation. People who have used psychotropic drugs often report that drugs, like salvia, free your mind to think any thoughts you want.

To people who haven't had this experience that sentiment seems absurd because everyone likes to believe we already have the freedom to think anything we want. But that's not true. Certain drug experiences do expand a person's scope and freedom of thought just as repeated exposure to certain images narrow our scope of thought... like too much TV, video games or porn.

What the legislation seems to be proposing is that this plant causes a set of experiences that the article summarizes (assume simply for the sake of brevity) as hallucinations. It is well established science that the experience is much more complex and complicated than that but as a matter of public policy the Government of Canada is saying Canadians should never under any circumstances have those experiences.

My position is that it is a proven fact that if we take that route we will be a poorer (spiritually and commercially), less creative and less enlightened society.

Citizen Input: Salvia

[REDACTED] to: OCS.Policy.and.Regulatory.Affairs

2011-03-01 01:33 AM

I am very interested in contributing to the discussion of this proposed legal change.

I have noted for some years that Salvia has been available for sale in reputable shops and at a reasonable price in its natural forms.

[REDACTED]  
follows nearly 2000 years of recorded use of Salvia and no clearly documented problem, injuries or ill effects directly attributable to the drug.

My single personal experience with the plant was very meaningful and I believe contributed to spiritual and cultural insights that I have been writing about and contemplating for several years.

I understand the proliferation of YouTube clips give the appearance of something sinister but consider what is really happening in these clips which are now being deleted from YouTube. With very few exceptions these are teenagers trying something one time that is the equivalent of spinning around on a swing until they are very very dizzy then trying to walk. Lots of people have done this. Is it good or bad? Who is to say. Is addictive? No. Could anything bad come of it? It's possible, but would it be rational to then ban spinning in circles. No.

The plant is natural, not part of any criminal supply chain, anti-addictive in the extreme and a very reasonable substitute for other illegal, manufactured and crime-related psychotropic drugs. It's effects are very brief yet powerful and - to many people throughout the last couple thousand years - very meaningful as part of religious experiences, spiritual quests and personal searches for deeper meaning in life.

It is undeniable that some of those who have used psychotropic drugs have gained from it greatly and added invaluable to our culture, art, music and understanding of ourselves and the world around us. From native shamans to the Beatles we can see that the world would be a much poorer place without psychotropics and the amazing people who have used them to explore our spiritual world.

After all this time and not a single direct causal injury to anyone or anything from Salvia (a remarkable feat that beer, wine cigarettes and spirits certainly couldn't boast or even aspirin or sugar for that matter) the knee jerk reaction, as if this were the days of opium addicts sprawled around bongos, is for the Government of Canada to ban,

s.19(1)

outright, Salvia simply because they became aware of its existence.

We have vast and terrible knowledge of what happens next if that happens. The substance leaves the shelves of normal commerce and heads in to the realm of the criminal; the price goes up, the purity becomes tainted and it is just added to the list of illegal drugs separating the most vulnerable form civil society and filling our prisons with young poor uneducated citizens. It becomes the very thing the government, with this proposed ban is trying to stop. It becomes accessible only to those who would break the law, those who would abuse and misuse. It becomes inaccessible to all those who might use it to expand all of our cultural spiritual and personal understanding of ourselves and the natural world around us - as it has been used for thousands of years.

I also understand that the ban could be considered required for consistency with other drugs. I would point out however that by that same logic we would certainly ban tobacco, alcohol, caffeine and probably sugar. We just can't ban our way to the society we think we want.

I know I am only one voice but what I want to do is propose a reasonable alternative: Don't criminalize the plant in one step and risk destroying the cultural and spiritual meaning of the plant. Respect it for what it is and what it offers all society, particularly those responsible and interested in exploring what it offers without wanting to break the laws of their country. Set a rule that the plant should not be sold to anyone under 18. Monitor the situation for a year. If a single injury, misadventure or ill-effect is verifiably reported by a single Canadian, or anybody anywhere in the world, then set the laws such that it is controlled in the same way cigarettes or liquor is controlled (both verified to be infinitely more dangerous and addictive substances).

As a practical matter, the plant is among the most easily grown and cultivated on any windowsill and almost impossible to pick out from any common plantain. It seems to me the pursuit of making the drug illegal now that its place in popular culture is set and widely known would be to make criminals out of thousands of middle-class teenagers and deny people with a genuine spiritual interest an inalienable right to their personal beliefs while costing millions of dollars to solve a non-existent problem.

I am happy to speak on this issue any time.

Sincerely,

Brenda

I am attaching what we propose to send out in response to all the emails RPD has received in response to the NOI on salvia. It is consistent with emails we have used for the same purpose but in relation to other regulatory files, and is also akin to what we typically send in response to respondents who file comments during a prepublication comment period. As you will see, it is very generic and does not seek to respond to any particular issue(s) raised by the correspondent, and this is on purpose as it avoids us having to get into long defensive letters where we have to keep explaining our actions in acknowledging every set of comments received.

In conversation with Jesse yesterday, she mentioned that ADMO has already received a few letters re salvia directly, and she asked what our process was in terms of responding to them. If you are OK with this, I would like to advise her that they should forward any correspondence they receive to OCS, and we will acknowledge it in exactly the same way, adding, if necessary, a line that says the letter was forwarded to us from ADMO for the purposes of a direct reply.

Please advise (and happy to discuss of course).

Jocelyn

RE: Dep. of Health Notice. Feb. 4, 2011

to: ocs.policy.and.regulatory.affairs

2011-03-04 11:21 AM

History: This message has been forwarded.

Dear Stephanie Chandler,

I very much appreciate your getting back to me on this subject. I also thank you for providing me the link to Salvia divinorum page on Health Canada's website.

I am now quite concerned, however, that this species might be made outright illegal based on, more or less, uncertainty. It would seem the tone of that page is already set against scheduling this plant species without requiring much additional study.

I realize that a big issue at hand is the issue of youth gaining access to prepared Salvia material for purposes of intoxication. For this I do not differ from Health Canada's view on the need to act in some form to prevent such activities. I recently was reading that dried preparations of Salvia are being sold packaged and labeled as intoxicants, or legal highs, in convenient stores and the like. Much like tobacco and alcohol products, I am in full favour of implementing control measures to prevent underage use of such things. Also like tobacco, Salvia divinorum is hallucinogenic. But unlike tobacco (*Nicotiana glauca*), which is well studied and showed to be lethal at high doses and cause numerous health risks in prolonged use, Salvia is not known. It seems quite premature to make such drastic decisions affecting our rights as Canadian citizens based on "unknown data".

Once again, the main thing I am very much concerned with is the banning of any living species for purposes of cultivation and related activities to cultivation. I think that it is very much important for any free country to limit the amount of living species, nature if you will, that is made illegal. Banning an entire species outright can cause untold problems for future study, developments and even freedoms according to our charter of rights.

In relation to the link you kindly provided me, I would like to perhaps discuss this issue, topic by topic, if you would be so kind as to read through my lengthy emails.

### **The Issue**

Websites promoting use as legal hallucinogen. I have no disagreement with such a case, and might even add that it is likely marketed in "marijuana shops" as well. On the link provided it states: "Scientific reports also suggest that it has the potential for abuse." There have also been reports to the contrary. Such organizations as the DEA in the United States, which are quite against the use of hallucinogenic plants, state that this plant is not likely to be abused. The chemical Salvinorin A is simply not addictive as it works in quite the opposite way. It is just not possible to get addicted to it. Abuse will simply lie within the "party" crowd that will find any number of ways to intoxicate themselves, in which there is no shortage of methods to do so, from quite legal sources.

In the third paragraph of "The Issue", it states: "Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body. There is also no way to predict how it will affect you with each use."

This paragraph seems at odds with the original statement of protecting youth. Although I do not particularly agree with the use of hallucinogenic compounds for recreational use, this paragraph seems to imply that Canadians of mature age do not have the mental capacity to decide for themselves to use a product that is only known to produce hallucinations. Much like the native people of Canada and the US using peyote in their religious ceremonies, people have also traditionally used *Salvia divinorum* for their religious reasons and it seems very non-Canadian to limit one's religious freedoms or belief system based

on the fact Health Canada does not know of any long term health problems. Surely there are more health concerns well documented with the use of tobacco products, and those such products have an age limit and do not get limited by any such scheduling such as Salvia divinorum is now facing.

I do not intend on comparing Salvia divinorum to Nicotiana tobacum as Nicotiana has a far lower concentration of its hallucinogenic compounds than does Salvia divinorum, however S. divinorum in low doses does not produce hallucinations and has by some proven to show anti-depressant activities without any form of intoxication. Much like N. tobacum doesn't show any form of hallucinatory effects until a certain threshold has been reached.

### **Risks Associated with the Use of Salvia divinorum**

I happen to agree with much of this, but again Health Canada seems to be treading on thin ice by implementing restrictions on Canadians based on something they have not studied. I also feel that all this is based on prepared material, and has little to do with the live plants. The point: "The purity of the product (products that contain S. divinorum may be mixed with other substances) " The purity of any single product is completely unknown to the consumer, even medicine and food products. Consumers rely totally on the person manufacturing it. This alone shows that perhaps a ban of prepared material is wise, as live plants are not likely to be tainted, or even used, by the common party goer that just wants something to intoxicate themself with.

The risks listed here can be applied to any number of things, even some vegetables, and pose little reasoning for the prosecution (such as tainting ones record or imprisonment) of citizens cultivating this species.

### **Minimizing Your Risk**

Again, i have little to disagree with, however the way this is written implies the decision is already decided to schedule the entire S. divinorum complex and products without any more thought.

Paragraph 1 states: "Health Canada recommends that you should not use S. divinorum because little is known about the long-term effects it may have on your body and/or brain functions. There is also no way to predict how it will affect you with each use. Just because a drug is plant-based or "natural", does not mean that it is safe. "

This holds true for all sorts of chemicals, not just this one. New medicines that have undergone extensive testing still cannot accurately explain long term effects, as Health Canada well knows from past experiences. This is more of a common sense thing with every single type of chemical that has not gone observation for extended periods. The last sentence claiming natural, or plant based, drugs are not always safe is also a matter of common sense. There is nothing to say it is unsafe either, at least physically, at this point. This point is also relevant to any other plant species and drug derived from. Take Atropa and Brugmansia, super hallucinogenic plants that are also used to obtain certain chemicals form for eye medicine and drops. The plant is quite dangerous to use, but has useful products in them. These advancements would not have been possible if various nations scheduled the entire species.

### **Legal Status of Salvia divinorum In Canada**

I totally and whole heartedly agree with making any prepared part of salvia a "Natural Health Product" and controlling it as such. But again, this has nothing to do with a living plant.

The article states: "The sale of unauthorized natural health products containing S. divinorum or its main active ingredient salvinin A may be subject to compliance and enforcement action by Health Canada under the Food and Drugs Act."

That seems quite logical, and I cannot think of any reason to disagree with such a reasoning of controlling the prepared plant material. Though I feel it would be quite against the good of the Canadian people to add the species, Salvia divinorum, to the Controlled Drugs and Substances Act, I can accept the reasoning behind adding the active chemical salvinin A to the act. This makes sense seen as it is the "Controlled

s.19(1)

Drugs and Substances Act" and not the "Controlled Species Act".

### **In Other Countries**

This is perhaps one of the most worry some aspects of the article. The lack of actual study and research and the willingness to "follow along" is truly frightening and a sign of Canada's depreciation as an independent nation capable of extensively investigating matters before willing to risk its own freedoms. I feel that certain countries, especially Australia and the United States, are particularly poor examples to follow in regards to rights and freedoms of the people, as is quite apparent in recent years. Though even the US DEA has reported little risk of abuse fo this substance simply due to its lack of addictiveness and relatively unpleasantness of the effects at hallucinogenic levels.

### **Background**

Here reveals the lack of independent research done, which I hope brings about some reasoning. *Salvia divinorum* is known to rarely produce seeds, and is next to impossible to get to set seed. Some very few people, through exhaustive work, have managed to produce seed. Health Canada's website has stated: "The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes."

Seeds are just not a normal thing, and though true they have been produced, are by no means a way of multiplying. IN fact most plants sold on the internet get tagged with names for clones taken as they are almost exclusively multiplied via vegetative methods.

In closing, I strongly urge Health Canada to seriously consider teh ramifications of threatening it's citizens with punishment for cultivating the species *Salvia divinorum*, and instead rely on facts, study and common sense to perhaps control the production of refined compounds and marketing strategies that promote recreational hallucinogen use. I feel that the prosecution of any Canadian citizen for cultivating a plant goes against our basic rights and freedoms which we claim to hold so dear. Jailing our own people for gardening is quite a big leap in teh wrong direction from our previous happy, easy going Canadian lifestyle, and I sincerely hope we can remain as free as we have been in previous years.

I really appreciate your willingness to hear people out and be open to communication on matters that may greatly affect our rights and freedoms as Canadians.

Once again, thank you.

Subject: Re: Dep. of Health Notice. Feb. 4, 2011

Date: Thu, 3 Mar 2011 15:02:49 -0500

Dear [REDACTED],

I am writing to acknowledge receipt of your email with regards to the publication of the *Notice to Interested Parties* outlining Health Canada's proposal to add *Salvia divinorum* and salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA).

I thank you for your comments regarding this proposal and can assure you they will be taken into consideration as the federal regulatory process progresses. There will also be additional opportunities for comment should a complete regulatory proposal be pre-published in *Canada Gazette*, Part I.

Please respond to

Hi

I'm a Canadian and an amateur botanist.

I have a large collection of exotic foreign plants, some of which may contain alkaloids.

I hope we're not going down a path of wholesale criminalization of plants, here.

If in fact there is a serious *Salvia* abuse problem, I'm all for resolving it. However, do you solve a problem of kids huffing gasoline by banning gasoline? Thankyou for taking the time to read this and have a nice day.

Regards,

*Replied to with std msg.  
It did not save/print.*

Hi Denis,

There have been a couple of responses to the acknowledgement email sent out yesterday. Do you think its necessary to acknowledge again or reply in some way?

Thanks,

Stephanie

Dear Stephanie Chandler,

I very much appreciate your getting back to me on this subject. I also thank you for providing me the link to Salvia divinorum page on Health Canada's website.

I am now quite concerned, however, that this species might be made outright illegal based on, more or less, uncertainty. it would seem teh tone of that page is already set against scheduling this plant species without requiring much additional study.

I realize that a big issue at hand is the issue of youth gaining access to prepared Salvia material for purposes od intoxication. For this I do not differ from Health Canada's view on teh need to act in some form to prevent such activities. I recently was reading that dried preparations of Salvia are being sold packaged and labeled as intoxicants, or legal highs, in convenient stores and the like. Much like tobacco and alcohol products, I am in full favour of implementing control measures to prevent underage use of such things. Also like tobacco, Salvia divinorum is hallucinogenic. But unlike tobacco (Nicotiana tobacum), which is well studied and showed to be lethal at high doses and cause numerous health risks in prolonged us, Salvia is not known. It seems quite premature to make such drastic decisions affecting our rights as Canadian citizens based on "unknown data".

Subject: For approval: Media query - INTERVIEW - Niagara Falls review - [REDACTED] - Salvia

Hi Jocelyn and Suzanne,

Below is a media enquiry for your approval please by 2pm today please. We are recommending written responses.

**Suzanne** - I believe only A1 is for your approval.

Thanks,  
Nicole

This reporter did a story on Salvia back in 2008; , where he wrote; At the time "... HC is researching salvia and "may" take action ... " He's following up on this story and asking pretty standard Questions - seeking interview ideally (for Tuesday), but willing to receive written responses by Monday COB.

**Q1** - Has / is HC studying this issue? What have been the results?

A1 - Health Canada has reviewed information and reports from a variety of sources regarding the use and dangers of salvia and has assessed its findings against several key factors involved in the determination of the scheduling of a substance, including

- its pharmacological similarity to other substances already regulated under the CDSA;
- its potential for abuse related to its hallucinogenic properties, and the fact that about 7% of youth 15-24 years of age have used it - this represents about 300,000 youth;
- the health risks associated with this substance as shown from some reports of adverse incidents, for example, an article in the Journal of Emergency Medicine in 2009 indicates that 39 adverse neurological, cardiovascular and gastrointestinal events associated with the use of salvia were reported to a statewide (California) poison control system over the span of a decade.
- Health Canada is also aware of other cases where suicide and psychotic symptoms were linked to use of *Salvia divinorum*.

003171

Health Canada is continuing to survey the prevalence of salvia use and in 2009, Health Canada started including questions on salvia use in both the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey. The Centre for Addiction and Mental Health in Toronto similarly included questions on salvia use in the Ontario Student Drug Use and Health Survey. As results from these surveys became available in 2009-2010, the Department was able to include Canadian surveillance data in its ongoing assessment of salvia.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of students grades 7-12 have used *Salvia divinorum* in the past year. This represents about 123,000 Canadian high-school students. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q2a - What evidence has been brought forward to support / refute the Gov't position on salvia?**

A2a- See A1

**Q2b - Does Health Canada deem salvia divinorum to be dangerous to the public?**

A2b- *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>)

**Q3 - Have stakeholders / who has been consulted in order to arrive at this decision?**

s.19(1)

A3 - See A1.

**Q4 - Has the recent publicity around recreational uses of salvia been a factor in the Government proposing a ban on salvia?**

A4 - Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q5 - What is the likely timeline for salvia to be added to the Controlled subs list? When will it be official?**

A5 - Health Canada considers several factors in determining whether the scheduling of a substance under the Controlled Drugs and Substances Act (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period (<http://canadagazette.gc.ca/rp-pr/p1/2011/2011-02-19/html/notice-avis-eng.html#d109>). This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

Subject: For approval: Media query - INTERVIEW - Niagara Falls review - [REDACTED] - Salvia

Hi Jocelyn and Suzanne,

Below is a media enquiry for your approval please by 2pm today please. We are recommending written responses.

Suzanne - I believe only A1 is for your approval.

Thanks,  
Nicole

This reporter did a story on Salvia back in 2008; , where he wrote; At the time "... HC is researching salvia and "may" take action ... " He's following up on this story and asking pretty standard Questions - seeking interview ideally (for Tuesday), but willing to receive written responses by Monday COB.

**Q1 - Has / is HC studying this issue? What have been the results?**

A1 - Health Canada has reviewed information and reports from a variety of sources regarding the use and dangers of salvia and has assessed its findings against several key factors involved in the determination of the scheduling of a substance, including

- its pharmacological similarity to other substances already regulated under the CDSA;
- its potential for abuse related to its hallucinogenic properties, and the fact that about 7% of youth 15-24 years of age have used it - this represents about 300,000 youth;
- the health risks associated with this substance as shown from some reports of adverse incidents, for example, an article in the Journal of Emergency Medicine in 2009 indicates that 39 adverse neurological, cardiovascular and gastrointestinal events associated with the use of salvia were reported to a statewide (California) poison control system over the span of a decade.
- Health Canada is also aware of other cases where suicide and psychotic symptoms were linked to use of *Salvia divinorum*.

Health Canada is continuing to survey the prevalence of salvia use and in 2009, Health Canada started including questions on salvia use in both the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey. The Centre for Addiction and Mental Health in Toronto similarly included questions on salvia use in the Ontario Student Drug Use and Health Survey. As results from these surveys became available in 2009-2010, the Department was able to include Canadian surveillance data

in its ongoing assessment of salvia.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of students grades 7-12 have used *Salvia divinorum* in the past year. This represents about 123,000 Canadian high-school students. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q2a - What evidence has been brought forward to support / refute the Gov't position on salvia?**

A2a- See A1

**Q2b - Does Health Canada deem salvia divinorum to be dangerous to the public?**

A2b- *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>)

**Q3 - Have stakeholders / who has been consulted in order to arrive at this decision?**

A3 - See A1.

**Q4 - Has the recent publicity around recreational uses of salvia been a factor in the Government proposing a ban on salvia?**

A4 - Scheduling these products will reduce the potential risks to the health and safety of Canadians

associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q5 - What is the likely timeline for salvia to be added to the Controlled subs list? When will it be official?**

A5 - Health Canada considers several factors in determining whether the scheduling of a substance under the Controlled Drugs and Substances Act (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period (<http://canadagazette.gc.ca/rp-pr/p1/2011/2011-02-19/html/notice-avis-eng.html#d109>). This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

Hi Jocelyn,

Below is the other salvia media enquiry for your input and approval by 2pm please. We are recommending written responses again.

Thanks,

Nicole

\*\*\*\*\*

Another request for information - INTERVIEW - with the following questions (link to the Salvia news release has been provided to requestor):

**Q1 - Info please: the legal status of salvia in canada right now.**

A1 - After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.

The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A. The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS), *Youth Smoking Survey* (YSS) and the *Ontario Student Drug Use and Health Survey* (OSDUHS), some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health

Canada under the *Food and Drugs Act and its associated regulations*.

**Q2 - Is there anything that has been taking place that has recently changed the legal status of salvia in Canada?**

A2 - See A1.

**Q3 - Is there a lot known about the effects (long term and otherwise)?**

A3 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>)

**Q4 - Many people say that a change in the legal status would be a preventative measure, can you talk about this?**

A4 - Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q5 - are there any other drugs that have the same status as salvia? (Interpret as... Are there any other substances currently awaiting to be placed on the Controlled Substances List)**

A5 - For OCS input?

**Q6 - How has the media affected our perception of the drugs danger? (Interpret as...was it because of**

s.19(1)

the media that there is now a push to schedule this substance)

A6- See A4.

Another request for information - INTERVIEW - with the following questions (link to the Salvia news release has been provided to requestor):

**Q1 - Info please: the legal status of salvia in canada right now.**

A1 - After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.

The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to*

*Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A. The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

~~Health Canada is continuing to survey the prevalence of salvia use and have based our proposed scheduling on available information and reports that suggest these substances have the potential for abuse, especially among young Canadians. The risks of salvia use include hallucinations, loss of consciousness and short-term memory loss.~~

The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS), *Youth Smoking Survey* (YSS) and the *Ontario Student Drug Use and Health Survey* (OSDUHS), some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act* and its associated regulations.

**Q2 - Is there anything that has been taking place that has recently changed the legal status of salvia in Canada?**

A2 - See A1.

**Q3 - Is there a lot known about the effects (long term and otherwise)?**

A3 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

s.19(1)

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>)

**Q4 - Many people say that a change in the legal status would be a preventative measure, can you talk about this?**

A4 - Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q5 - are there any other drugs that have the same status as salvia?**

A5 - Waiting for clarification....currently? going through the same process? etc

**Q6 - How has the media affected our perception of the drugs danger? (Interpret as...was it because of the media that there is now a push to schedule this substance)**

A6- See A4.

Below is the other salvia media enquiry for your input and approval by 2pm please. We are recommending written responses again.

Thanks,  
Nicole

\*\*\*\*\*

Another request for information - INTERVIEW - with the following questions (link to the Salvia news release has been provided to requestor):

**Q1 - Info please: the legal status of salvia in canada right now.**

A1 - After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.

The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which was published on February 19, 2011 for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A. The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the Controlled Drugs and Substances Act would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS), *Youth Smoking Survey* (YSS) and the *Ontario Student Drug Use and Health Survey* (OSDUHS), some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations* (NHPR). The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Q2 - Is there anything that has been taking place that has recently changed the legal status of salvia in Canada?**

A2 - See A1.

**Q3 - Is there a lot known about the effects (long term and otherwise)?**

A3 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (<http://www.hc-sc.gc.ca/hl-vs/iyh-vsv/life-vie/salvia-eng.php>)

**Q4 - Many people say that a change in the legal status would be a preventative measure, can you talk about this?**

**A4 -** Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q5 - are there any other drugs that have the same status as salvia? (Interpret as... Are there any other substances currently awaiting to be placed on the Controlled Substances List)**

**A5 -** For OCS input?

**Q6 - How has the media affected our perception of the drugs danger? (Interpret as...was it because of the media that there is now a push to schedule this substance)**

**A6- See A4.**
