Frank and Jackie - can you also check with RAPB re: their stakeholders that may suit this requirement.

This is quite pressing. I've attached here the template that we have been provided to complete for this request. If you could add the stakeholders to that.

How does it look to have something by 2:00 pm at latest to share with Jocelyn, Suzanne and Louis?

Thanks very much, S

Stakeholder Template.doc

---

Please see reply from Jesse below.

This is non-negotiable -- we are to provide names of stakeholder groups who we would anticipate would be supportive of this action.

Can we tap PACCB and/or RAPB - through their networks?

I missed you before your meeting

Short of the RCMP, we have no stakeholders to provide

Jocelyn Kula and Suzanne Desjardins would be the Dept. spokes (at Winnipeg and Mtl respectively)....  
Louis has asked to meet with both of them today at 12:30

**Contact Info for NDPAC Stakeholders - NADS Announcement**

Hi Kathy,

We're looking to contact potential stakeholder groups that could be interested in appearing with MO on Monday for a media release. On Monday MO will be announcing Health Canada's release of a Notice of Intent to schedule Salvia in the CDSA.

Based on the members of the NDPAC, would you have contact info for these groups so we may contact them?

- Centre of Excellence for Youth Engagement
- Canadian Association for School Health
- NECHI Training, Research and Health Promotions Institute
- Media Awareness Network
- Canadian Association of Family Resource Programs
- Canadian Executive Council on Addictions
- Alberta Alcohol and Drug Abuse Commission
- Drug Prevention Network of Canada (past President)

Thank you,  
Jackie

We will take the last four on the list if Denis takes the first four.

Matthieu, Anna, Jackie, Lyse - Since you are all in well before 9, can you each call one of the 4 organizations using the script and fill in the template below?

Denis - if you send your information you collect to us, we can collate it and get it in to DGO for the deadline. Please send to Anna and she will pull it all together.

I will try and be in by 9 this morning but will also have my blackberry on if anything comes up.

Subject: URGENT AR 11-103679-138 Ministerial Announcements on Salvia - February 21

---

hi all,  
Further to my earlier emails of today regarding this urgent request.

Unfortunately, we have no flexibility with this request or the deadline. ADMO wants to hear from us by 9:50 Monday morning.

This means these calls need to be made first thing Monday morning.

Recognizing we are up against a terrible time crunch and family day (we may not even get

people on the phone), these calls MUST be made - must be shown we have done this outreach.

Frank and Denis --

- **There are 8 stakeholders in the attached table listing list - please divide these among your teams and provide to DGO a consolidated report no later than 9:40 Monday morning** (some are an obvious fit for the given office - for example CCSA -- ideally OPSP call as there is a relationship there)
- Please use the table listing provided -- and completing the columns in the template re:

Positive or Negative?	Interested in Event?	Willing to Issue News Release	Willing to have Media Availability
-----------------------	----------------------	-------------------------------	------------------------------------

- Please indicate that a call was made -- whether or not a message was left or if you were able to speak with someone? with whom did you speak? did they give the impression of being supportive of this announcement by the govt. etc (per the columns as pasted above and in the template.)

For reference, I've also pasted here the communications products and the final DG-signed NOI in both languages re: the announcement of the publication of the NOI to CG1 this past weekend.

---- I suggest a very simple, high level "script" using the key messages from these materials, something along the lines of the following (definitely feel free to edit - I may have too much re: what the scheduling means and the question about making a public statement of support could use some nuancing...I defer to subject experts on the content!). Keeping in mind, everything will be online - so there will be public info. available, and the NOI is already online.

**Brenda** - are you fine with the proposed "script" below? - this is based on the news release.

Hello, my name is XXXXXX and I work at Health Canada.

I am calling to let you know about an announcement Health Canada will be making this morning regarding its proposal to schedule the substance Salvia to the Controlled Drugs and Substances Act.

A Notice to Interested Parties outlining Health Canada's proposal was published in *Canada Gazette*, Part I, this past Saturday, February 19, 2011. There is a 30-day period for people to provide their comments, which ends March 21, 2011.

The Department is taking this steps following a review of Canadian surveillance data and scientific reports which suggest that this substance

has the potential for abuse, especially among young people.

Salvia is a species of sage belonging to the mint family.

Stories about Salvia use, especially by youth, have often come up in the media.

We know that the risks of salvia use include hallucinations, loss of consciousness and short-term memory loss.

The scheduling of Salvia as a controlled substance would mean that activities such as possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation) would be illegal unless authorized by regulation.

Also, the scheduling of Salvia would enable law enforcement to take action against suspected illegal activities involving the substance.

More information about Salvia and details about the government's proposal is available at the Health Canada web site -- [www.hc-sc.gc.ca](http://www.hc-sc.gc.ca)

Part of the reason for my call this morning is also to get an understanding from you if this is an proposal your organization would support - in general terms but also through a public statement, such as a news release.

Is this something your organization would consider?

Thank you for your time this morning.

Thank you.

DEPARTMENT OF HEALTH

CONTROLLED DRUGS AND SUBSTANCES ACT

*Notice to interested parties - Proposal regarding the addition of Salvia divinorum and salvinorin A to Schedule III to the Controlled Drugs and Substances Act*

This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add the plant *Salvia divinorum* (*S. divinorum*) and its main active ingredient salvinorin A to Schedule III to the *Controlled Drugs and Substances Act* (CDSA). Stakeholders may also identify themselves for inclusion in any future consultation.

*S. divinorum* is a species of sage belonging to the mint family. Its leaves are generally chewed or smoked to obtain psychotropic effects. While uncertainty remains surrounding the health risks of *S. divinorum*, known effects are reported to be short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant. Neither *S. divinorum* nor salvinorin A are currently included in any of the Schedules to the CDSA.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. *S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs.<sup>1</sup> Results from the *Canadian Alcohol and Drug Use Monitoring Survey* (CADUMS) reveal that, in 2009, 1.6% of Canadians aged 15 years and older reported having used *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24 years. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. Moreover, the 2009 *Ontario Student Drug Use and Health Survey* (OSDUHS) indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year. Because its psychoactive effects resemble those of other substances included in Schedule III to the CDSA such as lysergic acid diethylamide (LSD) and psilocybin, Health Canada is concerned that the ready availability and use of *S. divinorum* poses a risk to the health and safety of Canadians, particularly youth.

While *S. divinorum* and salvinorin A are not currently included in any of the United Nations Drug Control Conventions, a number of countries have chosen to regulate one or both as controlled substances. Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden have all placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. Some American states have also implemented laws restricting their use, sale and/or distribution.

Date: 2011-02-18 05:18 PM  
Subject: Re: URGENT AR 11-103679-138 Ministerial Annoucements on Salvia - February 21

Including these substances within Schedule III to the CDSA would prohibit: possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation). The regulation of *S. divinorum* and salvinorin A under the CDSA will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

As this action is not intended to interfere with the use and availability of *S. divinorum* and/or salvinorin A for legitimate medical, scientific or industrial purposes, Health Canada is seeking information from stakeholders on whether there are any such uses in Canada. Information received in response to this notice will be instrumental in determining appropriate regulation under the CDSA.

The publication of this notice begins a 30-day comment period. There will be additional opportunities to provide comments as the federal regulatory process progresses.

If you are interested in this process or have comments on this proposal, please contact Stephanie Chandler, Regulatory Policy Division, Office of Controlled Substances, Address Locator: 3503D, 123 Slater St., Ottawa, Ontario, Canada, K1A 1B9, by fax at (613) 946-4224 or by email at [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## MINISTÈRE DE LA SANTÉ

### LOI RÉGLEMENTANT CERTAINES DROGUES ET AUTRES SUBSTANCES

*Avis aux parties intéressées - Proposition concernant l'ajout de Salvia divinorum et de la salvinorine A à l'annexe III de la Loi réglementant certaines drogues et autres substances*

Cet avis informe les parties intéressées de la possibilité de commenter la proposition de Santé Canada d'ajouter la plante *Salvia divinorum* (*S. divinorum*) et son principal ingrédient actif, la salvinorine A, à l'annexe III de la *Loi réglementant certaines drogues et autres substances* (LRCDas). Les parties intéressées ont aussi l'occasion d'ajouter leur nom pour toute consultation future.

*S. divinorum* est une espèce de sauge appartenant à la famille des menthes. Généralement, ses feuilles sont mâchées ou fumées pour obtenir des effets psychotropes. Alors qu'une incertitude subsiste quant aux risques pour la santé découlant de la consommation de *S. divinorum*, les effets de cette consommation sont connus pour être brefs et comprennent des hallucinations, une dysphorie, des expériences extra-corporel, l'inconscience et une perte de mémoire à court terme. Les effets, qui varient d'une personne à l'autre, sont également souvent décrits comme déplaisants. Ni la *S. divinorum* ni la salvinorine A ne sont actuellement incluses dans les annexes de la LRCDas.

Des rapports ont récemment été publiés indiquant que des adolescents et des jeunes adultes canadiens consomment de la *S. divinorum* pour sa capacité à produire des hallucinations. *S. divinorum* est largement vantée comme un hallucinogène "légal" sur Internet et a aussi été signalée comme l'un des produits à base d'herbes médicinales les plus courants utilisés comme option alternative aux drogues illicites.<sup>1</sup> Les conclusions tirées de l'*Enquête de surveillance canadienne de la consommation d'alcool et de drogues* (ESCCAD) révèlent que, en 2009, 1,6 % des Canadiens âgés de 15 ans ou plus ont déclaré avoir consommé de la *S. divinorum* au moins une fois dans leur vie, avec un taux de consommation plus important (7,3%) parmi les jeunes âgés de 15 à 24 ans. Les résultats de l'*Enquête sur le tabagisme chez les jeunes* de 2008-2009 au Canada montrent également que 5 % des jeunes de 15 ans ont consommé de la *S. divinorum* au cours de la dernière année. De plus, le *Sondage sur la consommation de drogues et la santé des élèves de l'Ontario* (SCDSEO) de 2009 indique que 5,4 % des élèves de l'Ontario des classes scolaires 7 à 12 ont déclaré avoir déjà consommé de la *S. divinorum* et que 4,4 % de ces élèves ont indiqué avoir consommé cette substance au cours de la dernière année. Puisque ses effets psychoactifs ressemblent à ceux d'autres substances comprises dans l'annexe III de la LRCDas, comme l'acide lysergique diéthylamide (LSD) et la psilocybine, Santé Canada craint que la disponibilité immédiate et la consommation de *S. divinorum* ne posent un risque pour la santé et la sécurité des Canadiens, en particulier pour celles des jeunes.

---

<sup>1</sup>Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. Oct 2005, vol. 39, no°10, pp. 1634-1639.

Alors que la *S. divinorum* et la salvinorine A ne sont actuellement comprises dans aucune des Conventions de l'Organisation des Nations Unies sur le contrôle des drogues, de nombreux pays ont choisi de réglementer une de ces substances, ou les deux, comme substance désignée. L'Australie, la Belgique, le Danemark, la Finlande, l'Allemagne, l'Italie, le Japon, la Corée du Sud, l'Espagne et la Suède ont tous établi des contrôles sur les importations ou la vente, ou les deux, de *S. divinorum* et/ou de salvinorine A. Certains États américains ont aussi mis en oeuvre des lois restreignant son utilisation, sa vente et/ou sa distribution.

Le fait d'ajouter ces substances à l'annexe III de la LRCDas en interdirait la possession, le commerce, la possession aux fins de commerce, l'importation, l'exportation, la possession aux fins d'exportation et la production (ou la culture). La réglementation de la *S. divinorum* et de la salvinorine A conformément à la LRCDas permettrait également aux organismes d'application de la loi de prendre des mesures contre les activités illicites présumées liées à ces substances.

Étant donné que cette mesure ne vise pas à interférer avec l'utilisation et la disponibilité de la *S. divinorum* et/ou de la salvinorine A à des fins médicales, scientifiques ou industrielles légitimes, Santé Canada sollicite de l'information aux parties intéressées sur les possibilités de ces types d'utilisation au Canada. L'information reçue en réponse à cet avis sera déterminante dans la rédaction d'un règlement approprié conformément à la LRCDas.

La publication de cet avis entame une période de commentaires de 30 jours. Il y aura des occasions supplémentaires de fournir des commentaires au fur et à mesure que progresse le processus de réglementation fédéral.

Si vous êtes intéressé par ce processus ou que vous avez des commentaires sur cette proposition, veuillez communiquer avec Stephanie Chandler de la Division de la politique réglementaire, du Bureau des substances contrôlées, situé au : 3503D, 123, rue Slater, Ottawa (Ontario), Canada, K1A 1B9, par télécopieur au (613) 946-4224 ou par courriel au [OCS\\_Policy\\_and\\_Regulatory\\_Affairs@hc-sc.gc.ca](mailto:OCS_Policy_and_Regulatory_Affairs@hc-sc.gc.ca).

## Salvia divinorum

News Release: The Government of Canada Proposes to Schedule Salvia Divinorum and Salvinorin A as Controlled Substances (insert link)

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Certain websites promote the use of *S. divinorum* as a “legal” alternative to street drugs. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

Canadians should not use products containing *S. divinorum* and/or salvinorin A because they are hallucinogenic and little is known about the long-term effects of these substances on the brain and body; how it interacts with other substances, including other drugs, natural health products and alcohol; and the potential of *S. divinorum* to produce physical dependence and/or addiction.

### Risks Associated with the Use of *Salvia divinorum*

*S. divinorum* is known to have both physical and mental effects, which may include:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

### Legal Status of *Salvia divinorum*

#### In Canada

*S. divinorum* currently meets the definition of a natural health product (NHP) under the *Natural Health Products Regulations*. As of February 2011, Health Canada has not authorized for sale any natural health products which contain *S. divinorum* as an ingredient. The sale of unauthorized natural health products containing *S. divinorum* or its main active ingredient salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act*.

While *S. divinorum* and salvinorin A are not currently scheduled under the *Controlled Drugs and Substances Act* (CDSA), Health Canada has issued a Notice to Interested Parties which proposes to include *S. divinorum* and salvinorin A as controlled substances under the CDSA. This means that activities such as possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting would be illegal unless authorized by regulation.

### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy and Japan, have placed similar controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed similar restrictions on their sale and/or import.

### **Research on the use of *Salvia divinorum* in Canada?**

Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *S. divinorum* and 4.4% of these students reported using this substance in the past year.

### **Need More Info?**

For information on how to submit a consumer or trade complaint about the unauthorized sale of health products containing *S. divinorum* please consult the following documents:

- Consumers: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php)
- Trade: [http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_38\\_trade-industrie\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_38_trade-industrie_cp-pc-eng.php). Or contact the **Health Products and Food Branch Inspectorate** directly by calling toll-free 1-800-267-9675.

To report an adverse reaction or interaction involving any health product, contact Health Canada at 1-866-234-2345 (toll free in Canada), or visit the [MedEffect Canada](http://www.health.gc.ca/medeffect) web section at: [www.health.gc.ca/medeffect](http://www.health.gc.ca/medeffect)

For more information on the risks of using Salvia, please see *It's Your Health* at: (insert link)

## NOTICE TO MEDIA

February 19, 2011

MP Shelly Glover (Saint Boniface) will make an announcement on behalf of the Honourable Leona Aglukkaq, Minister of Health, related to the health and safety of Canadians.

**Date**

February 21, 2011

**Time**

1:45 p.m. (CST)

**Location**

**DRAFT**  
11/02/2011

**Media Lines**  
***Salvia divinorum***

**Issue**

There is ongoing media interest regarding the availability of *Salvia divinorum* in Canada as well as Canadian surveillance data suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has concluded that *Salvia divinorum* and its main active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* (CDSA) in order to protect the health and safety of Canadians, particularly youth. A Notice to Interested Parties outlining Health Canada's proposal to regulate this substance will be published in *Canada Gazette*, Part I, on February 19, 2011 (TBC).

**Key Messages:**

- The Government of Canada is taking these steps in order to protect the health and safety of Canadians, particularly youth, from the potentially harmful effects of *Salvia divinorum* and/or salvinorin A.
- After reviewing available information and reports that suggest these substances have the potential for abuse, especially among young people, Health Canada is proposing to schedule both *Salvia divinorum* and its main active ingredient salvinorin A as controlled substances.
- Health Canada is continuing to survey the prevalence of salvia use and have based our proposed scheduling on available information and reports that suggest these substances have the potential for abuse, especially among young Canadians. The risks of salvia use include hallucinations, loss of consciousness and short-term memory loss.
- The proposed inclusion of *Salvia divinorum* and salvinorin A in Schedule III to the *Controlled Drugs and Substances Act* would make possession, trafficking, importation, exportation, production (or cultivation), possession for the purpose of trafficking or possession for the purposes of exporting illegal unless authorized by regulation.

**Supplementary Messages:**

- Though it is a hallucinogen, the plant *Salvia divinorum* is not currently scheduled under the CDSA.
- To date, Health Canada has not authorized for sale any natural health products which contain *Salvia divinorum* as an ingredient. The sale of unauthorized natural health products containing *Salvia divinorum* or its active ingredient

**DRAFT**  
11/02/2011

salvinorin A may be subject to compliance and enforcement action by Health Canada under the *Food and Drugs Act and its associated regulations*.

**Questions and Answers:**

**Q1 - What are the risks associated with the use of *Salvia divinorum***

A1 - *S. divinorum* is known to have both physical and mental effects. The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- dysphoria (feeling anxious, depressed or restless)
- out-of-body experiences
- uncontrollable laughter
- loss of consciousness
- short-term memory loss
- lack of physical coordination
- slurred speech and awkward sentence patterns

There is no way to predict what effect these substances may have on an individual. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (products that contain *S. divinorum* may be mixed with other substances);
- how it is taken, for example, whether the product is chewed, swallowed or smoked; and
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the main active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or if it can cause permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol;
- the potential of *S. divinorum* to produce physical dependence and/or addiction.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

**Q2 – What is involved in scheduling *Salvia divinorum* as a controlled substance and what stage is it at?**

**DRAFT**

11/02/2011

A2 - Health Canada considers several factors in determining whether the scheduling of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- Overall risk to public health and safety posed by the substance.
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- International requirements and trends in international control.

Health Canada recently concluded its assessment of *Salvia divinorum* and salvinorin A against these factors and proposes to include both substances in Schedule III to the CDSA. The first step in the process of scheduling a substance under the CDSA is the publication of a *Notice to Interested Parties* (NOI) in *Canada Gazette*, Part I, which will be published on February 19, 2011 (TBC) for a 30-day comment period. This notice provides interested stakeholders with the opportunity to provide comments on Health Canada's proposal to add *Salvia divinorum* and its main active ingredient salvinorin A to Schedule III to the CDSA. Any comments received are considered during the preparation of a regulatory proposal. There will be additional opportunities for comment as the federal regulatory process progresses, which usually takes about 18 to 24 months to complete.

**Q3. Why has the Government now decided to schedule these substances under the CDSA?**

A3. Scheduling these products will reduce the potential risks to the health and safety of Canadians associated with their ready availability, with their increased use and their unknown effects. The scheduling of *Salvia divinorum* and salvinorin A will also eliminate the current misconception that these substances are a safe alternative to other illegal drugs. Furthermore, the scheduling will also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

**Q4 – Are *Salvia divinorum* and/or salvinorin A controlled internationally? How are these substances regulated in other countries?**

A4 - Neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions; as a result, there is no requirement for them to be scheduled as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

The move to include *Salvia divinorum* and salvinorin A in Schedule III to the CDSA is consistent with actions taken by several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, Norway, South Korea, Spain and Sweden) that have also placed similar controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A.

**DRAFT**  
11/02/2011

Some individual U.S. states have implemented similar laws restricting their use, sale and/or distribution.

**Q5 – Is there any research on the use of *Salvia divinorum* in Canada?**

A5 - Results from the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *Salvia divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24. The results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *Salvia divinorum* in the past year. The 2009 *Ontario Student Drug Use and Health Survey (OSDUHS)* indicated that 5.4% of Ontario students in grades 7-12 reported ever using *Salvia divinorum* and 4.4% of these students reported using this substance in the past year.

**Q6 – If Health Canada is aware that the use of *Salvia divinorum* can produce negative health effects such as hallucinations, feelings of anxiety, etc., why is it not controlled under the Controlled Drugs and Substances Act?**

A6 – The move to schedule *Salvia divinorum* and salvinorin A as controlled substances is based on surveillance data from surveys such as the *Canadian Alcohol and Drug Use Monitoring Survey (CADUMS)*, *Youth Smoking Survey (YSS)* and the *Ontario Student Drug Use and Health Survey (OSDUHS)*, some of which only became available in 2010.

In the interim, as *Salvia divinorum* is a plant with hallucinogenic properties, it currently meets the definition of a natural health product under the *Natural Health Products Regulations (NHPR)*. The sale of unauthorized natural health products may be subject to compliance and enforcement action in accordance with the *Food and Drugs Act* and its associated regulations.

**Q7 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A7 – Once *Salvia divinorum* and salvinorin A are included in Schedule III to the CDSA, law enforcement will be able to take appropriate action in response to suspected illegal activities with these substances.

Currently, however, *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. For more information on how to submit a consumer complaint about the unauthorized sale of drugs containing *Salvia divinorum* and/or salvinorin A, visit: [www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui\\_44\\_consumer\\_consommateur\\_cp-pc-eng.php](http://www.hc-sc.gc.ca/dhp-mps/compli-conform/prob-report-rapport/gui_44_consumer_consommateur_cp-pc-eng.php).

**DRAFT**  
11/02/2011

**Q8 - Has Health Canada issued any kind of warning to Canadians about *Salvia divinorum*?**

A8 - Health Canada has developed an *It's Your Health* article about *Salvia divinorum* to help inform the general public about the risks associated with the use of this plant. The article can be found on the Health Canada website at: (link to come). Health Canada also issued a news release on February XX announcing the Government of Canada's intention to schedule *Salvia divinorum* and salvinorin A, as controlled substances. A Notice to Interested Parties, outlining Health Canada's proposal, was published in *Canada Gazette*, Part I, on February 19, 2011 (TBC), giving interested parties a 30-day period to submit their comments. There will be additional opportunities for comment as the federal regulatory process progresses.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for medicinal and other purposes by the Mazatec people in Mexico.

Data from the 2008-2009 Youth Smoking Survey indicates that:

- 2.6% of students (grades 7-10) reported having used *Salvia divinorum* in the past year;
- 7.0% of students (grades 10-12) reported having used *Salvia divinorum* in the past year; and
- 5.0% of students 15 years of age reported using *Salvia divinorum* in the past year.

Data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) reveal that:

- 1.6% of Canadians reported using Salvia in their lifetime (0.2% in the past year); and
- the prevalence of lifetime use among youth (15-24 years of age) was 7.3% while only 0.5% of adults reported having ever used this substance.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year;
- 5.4% of students (grades 7-12) ever used *Salvia divinorum*; and
- use of *Salvia divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

**Issue: Proposal to add Salvia Divinorum and Salvinorin  
A to Schedule III to the *Controlled Drugs and  
Substances Act*.**

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Une substance connue sous le nom de salvia continue de gagner en popularité chez les jeunes, et certains d'entre eux en abusent. En tant que mère et que policière, je peux vous assurer qu'il s'agit d'une question qui me préoccupe

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add Salvia

divinorum, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will have a 30-day period to comment on our proposal. While we are consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

L'ajout de la *salvia divinorum* à la liste des substances contrôlées rendrait illégales les activités mettant en cause la salvia, comme la possession, le trafic, l'importation et la culture.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young people in Hollywood using Salvia to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening. We want to help Mom and Dad.

Nous agissons rapidement dans ce dossier, parce que nous voulons protéger nos jeunes des méfaits associés à la salvia.

Nous voulons éliminer les idées fausses selon lesquelles la salvia est un substitut sécuritaire aux drogues de la rue.

It is not.

All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like Salvia, particularly when they are in their teenage years.

I am happy to take your questions.

Thank you

**Parliamentary Secretary to the Minister of Finance**  
**Member of Parliament for Saint Boniface**

**Issue: Proposal to add Salvia Divinorum and Salvinorin  
A to Schedule III to the *Controlled Drugs and  
Substances Act.***

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Among today's youth, a substance known as Salvia has been gaining popularity, and is being abused by some young people. As a parent and a police officer, I can tell you that it's something I'm personally concerned about.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add *Salvia divinorum*, and its main active ingredient *salvinorin A*, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will

have a 30-day period to comment on our proposal. While we are consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

Adding *salvia divinorum* to the list of controlled drugs and substances would make activities with *salvia*, such as possession, trafficking, importing or cultivating illegal.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young people in Hollywood using *Salvia* to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening. We want to help Mom and Dad.

We're acting quickly on this because we want to protect our young people from the harms associated with *Salvia*.

We want to eliminate the misconceptions that *Salvia* is a safe alternative to street drugs.

It is not.

All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like *Salvia*, particularly when they are in their teenage years.

I am happy to take your questions.

Thank you.

2011-XX

# News Release

## Harper Government Takes Action to Protect Families

February 21, 2011

For immediate release

Factsheet: *Salvia Divinorum* (insert link)

**OTTAWA** – Today, MP Shelly Glover (Saint Boniface), Parliamentary Secretary to the Minister of Finance, and the Honourable Christian Paradis, Minister of Natural Resources, announced on behalf of the Honourable Leona Aglukkaq, Minister of Health, the Harper Government's proposed intention to include *Salvia divinorum* and salvinorin A, also known as Salvia, as controlled substances. A Notice to Interested Parties outlining Health Canada's proposal was published in *Canada Gazette*, Part I, on February 19, 2011.

"As a mother and police officer, I am pleased to see our Government take action to help parents protect their children from this dangerous substance," said P.S. Glover.

"After reviewing Canadian surveillance data and scientific reports that suggest this substance has the potential for abuse, especially among young people, we are taking these steps to protect the health and safety of Canadians from the harmful effects of this substance," said Minister Paradis.

The Notice to Interested Parties proposes that *Salvia divinorum* and its main active ingredient salvinorin A be added to Schedule III to the *Controlled Drugs and Substances Act*. This means that activities such as possession, trafficking, possession for the purpose of trafficking, importation, exportation, possession for the purpose of exportation, and production (or cultivation) would be illegal unless authorized by regulation. The scheduling of *Salvia divinorum* and salvinorin A as a controlled substance would also enable law enforcement agencies to take action against suspected illegal activities involving these substances.

Interested parties are encouraged to submit any comments regarding the Notice to Interested Parties by March 21, 2011.

For more information on *Salvia divinorum* and the risks associated with its use, please see *It's Your Health* at: (insert link to the *It's Your Health* article.)

## Fiche de renseignements Février 2011

---

### ***Salvia divinorum***

---

Communiqué de presse : Le gouvernement du Canada propose d'ajouter la salvia et la salvinorine A à la liste des substances contrôlées (insérer le lien)

La *salvia divinorum* (la salvia) est une espèce de sauge de la famille des labiacées. Certains sites Web encouragent la consommation de salvia comme substitut légal aux drogues de la rue. Les produits se vendent sous plusieurs formes, notamment en feuilles fraîches ou séchées, en liquides ou en graines et en boutures pour la culture.

Les Canadiens doivent éviter de consommer des produits contenant de la salvia, car il s'agit d'une substance hallucinogène dont on connaît mal les effets à long terme sur le cerveau et l'organisme, la façon dont elle interagit avec d'autres substances, comme d'autres drogues, des produits de santé naturel et l'alcool, et le risque de dépendance physique ou de toxicomanie associé à la consommation de la salvia.

#### **Risques associés à la consommation de salvia**

La salvia a des effets physiques et mentaux connus qui peuvent comprendre les suivants :

- hallucinations
- dysphorie (sentiment d'angoisse, de dépression ou d'agitation)
- expériences extracorporelles
- rire incontrôlable
- évanouissement
- perte de mémoire immédiate
- manque de coordination des mouvements
- trouble de l'élocution et phrases maladroites

#### **Statut juridique de la salvia**

##### Au Canada

La salvia correspond présentement à la définition d'un produit de santé naturel que donne le *Règlement sur les produits de santé naturels*. En février 2011, Santé Canada n'avait toujours pas homologué de produit de santé naturel contenant de la salvia. Conformément à la *Loi sur les aliments et drogues*, Santé Canada peut prendre des mesures coercitives à l'égard de quiconque vend des produits de santé naturels non homologués contenant de la salvia ou son principal ingrédient actif, la salvinorine A.

Si la salvia et la salvinorine A ne sont pas, à l'heure actuelle, considérées comme des substances contrôlées en vertu de la *Loi réglementant certaines drogues et autres substances*, Santé Canada a toutefois émis un avis aux parties intéressées dans lequel il propose de les ajouter à l'annexe III de la *Loi*. Cela signifie que les activités comme la possession, le trafic, l'importation, l'exportation, la production (ou la culture), la

possession en vue du trafic ou la possession en vue de l'exportation seraient illégales à moins d'être autorisées par réglementation.

#### À l'étranger

Plusieurs pays, notamment l'Australie, la Belgique, l'Allemagne, l'Italie et le Japon, réglementent l'importation et la vente de la salvia et de la salvinorine A.

Aux États-Unis, la salvia et la salvinorine A ne sont pas réglementées en vertu de la *Loi sur les substances contrôlées*, mais certains États ont adopté des mesures visant à en restreindre la vente et l'importation.

#### **Recherche sur l'utilisation de la *Salvia divinorum* au Canada**

L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues révèle qu'en 2009, 1,6 % des Canadiens ont déclaré avoir consommé de la salvia au moins une fois et que la consommation est beaucoup plus élevée (7,3 %) chez les jeunes de 15 à 24 ans. L'Enquête canadienne 2008-2009 sur le tabagisme chez les jeunes montre que 5 % des jeunes de 15 ans avaient consommé de la salvia au cours de l'année précédente. Selon le Sondage 2009 sur la consommation de drogues et la santé des étudiants de l'Ontario, 5,4 % des étudiants ontariens de la 7<sup>e</sup> à la 12<sup>e</sup> année ont déclaré avoir déjà consommé de la salvia, et 4,4 % d'entre eux ont affirmé en avoir consommée au cours au cours de l'année précédente.

# News Release

## Le gouvernement Harper prend des mesures pour protéger les familles

Le 21 février 2011

Pour diffusion immédiate

Fiche de renseignements : *Salvia divinorum* ([insert link](#))

**OTTAWA** – Aujourd’hui, la députée Shelly Glover (Saint-Boniface), Secrétaire parlementaire du ministre des Finances, et l’honorable Christian Paradis, ministre des Ressources naturelles, ont annoncé, au nom de l’honorable Leona Aglukkaq, ministre de la Santé, que le gouvernement Harper avait l’intention d’ajouter la *salvia divinorum* et la salvinorine A à la liste des substances contrôlées. Un Avis aux intéressés décrivant la proposition de Santé Canada a été publié dans la *Gazette du Canada*, Partie I, le 19 février 2011.

« En tant que mère et que policière, je suis heureuse que le gouvernement intervienne pour aider les parents à protéger leurs enfants contre cette substance dangereuse », a indiqué M<sup>me</sup> Glover.

« Après avoir pris connaissance des données de surveillance et des rapports scientifiques canadiens indiquant que certaines personnes, surtout les jeunes, pourraient abuser de la salvia, nous entendons protéger les Canadiens contre les effets dangereux de cette substance », a déclaré la ministre Paradis.

L’Avis aux intéressés propose d’ajouter la *salvia divinorum* et son principal ingrédient actif, la salvinorine A, à l’annexe III de la *Loi réglementant certaines drogues et autres substances*. Cela signifie que les activités comme la possession, le trafic, la possession en vue du trafic, l’importation, l’exportation, la possession en vue de l’exportation et la production (ou la culture) seraient illégales à moins d’être autorisées par réglementation. L’ajout de la *salvia divinorum* et de la salvinorine A à la liste des substances contrôlées permettrait aux organismes d’application de la loi de lutter contre les activités présumées illégales impliquant ces substances.

Les intervenants sont invités à faire parvenir leurs commentaires sur l’Avis aux intéressés d’ici le 14 mars 2011.

Pour de plus amples renseignements sur la salvia et les risques associés à son utilisation, veuillez consulter l'article de *Votre santé et vous* à : (insert link to the *It's Your Health* article.)

**Discours de  
l'honorable Christian Paradis,  
ministre des Ressources naturelles**

**Question : Proposition d'ajouter la *salvia divinorum* et la  
salvinorine A à l'annexe III de la *Loi réglementant  
certaines drogues et autres substances***

**Date : le 21 février 2011**

Seul le texte prononcé fait foi

Bonjour,

Je tiens à vous remercier de vous être joints à moi aujourd'hui pour ce que je considère une annonce très importante pour les familles canadiennes, annonce qui contribuera à la sécurité des collectivités.

Une substance connue sous le nom de salvia continue de gagner en popularité chez les jeunes, et certains d'entre eux en abusent.

Cette substance est populaire, car elle peut avoir les mêmes effets que certaines drogues illicites. Il y a aussi une fausse impression selon laquelle elle est sans danger.

Mais ce n'est pas le cas.

La salvia peut être très dangereuse.

Elle cause parfois des hallucinations et peut avoir d'autres effets néfastes sur le cerveau et l'organisme. À l'heure actuelle, les effets à long terme de cette substance sont peu connus.

L'Enquête de surveillance canadienne de la consommation d'alcool et de drogues de 2009 révèle qu'en 2009, 1,6 % des Canadiens de 15 ans et plus ont consommé de la *salvia divinorum* au moins une fois dans leur vie et que la consommation est beaucoup plus élevée (7,3 %) chez les jeunes de 15 à 24 ans.

De plus, les résultats de l'Enquête sur le tabagisme chez les jeunes 2008-2009, menée au Canada, révèlent que 5 % des jeunes de 15 ans ont consommé de la *salvia divinorum* au cours de l'année précédent l'enquête.

En raison des risques possibles pour la santé des Canadiens, en particulier celle des jeunes, nous proposons d'ajouter la *salvia divinorum*, et son principal ingrédient actif, la salvinorine A, à la *Loi réglementant certaines drogues et autres substances*.

Ces substances doivent être réglementées, tout comme les autres drogues illicites.

Dans un premier temps, un avis a été publié dans la *Gazette du Canada* au cours de la fin de semaine dernière, de sorte que tous les Canadiens disposent de 30 jours pour émettre leurs commentaires au sujet de notre proposition. Alors que nous consultons les Canadiens, notre position est claire. Nous voulons aider les parents, les familles et les collectivités à assurer la sécurité de nos enfants.

L'ajout de la *salvia divinorum* à la liste des substances contrôlées rendrait illégales les activités mettant en cause la salvia, comme la possession, le trafic, l'importation et la culture.

Ces mesures vont dans le sens de celles adoptés par d'autres pays, notamment l'Australie, la Belgique, l'Allemagne, l'Italie et le Japon, qui ont tous mis en place des contrôles semblables qui s'appliquent à l'importation ou à la vente de la *salvia*.

Le fait est que nos adolescents subissent déjà suffisamment de pression. Et, avec des histoires dans les médias de jeunes gens à Hollywood qui utilisent la salvia pour son effet euphorique, nous avons la responsabilité de faire ce qu'il faut pour protéger nos jeunes. Dans une économie aussi fragile que celle que nous connaissons présentement, les mères et les pères ne peuvent tout simplement pas se permettre de toujours surveiller ce que leurs jeunes font.

Ce que nous voulons, c'est aider ces parents.

Nous agissons rapidement dans ce dossier, parce que nous voulons protéger nos jeunes des méfaits associés à la salvia.

Nous voulons éliminer les idées fausses selon lesquelles la salvia est un substitut sécuritaire aux drogues de la rue.

Ce n'est pas le cas.

Toutes les mesures que nous prenons visent à protéger la santé et la sécurité des Canadiens des effets néfastes que peut avoir cette substance. Nous savons que les parents veulent que leurs enfants soient protégés contre les substances comme la salvia, surtout pendant leur adolescence.

C'est avec plaisir que je répondrai maintenant à vos questions.

Merci.

**Speech for  
The Honourable Christian Paradis,  
Minister of Natural Resources**

**Issue: Proposal to add Salvia Divinorum and Salvinorin  
A to Schedule III to the *Controlled Drugs and  
Substances Act*.**

**Date: February 21, 2011**

Check Against Delivery

Good Morning/Afternoon:

I'd like to thank you for joining me here today for what I consider to be a very important announcement for Canadian families and safer communities.

Among today's youth, a substance known as Salvia has been gaining popularity, and is being abused by some young people.

Its popularity comes from the fact that it can have some of the same effects as certain illicit drugs, and there is also a false perception that it is safe.

But it isn't safe.

Salvia has the real potential to be harmful.

It can cause hallucinations and can have other serious effects on the brain and body. At this point, very little is known about the long-term effect of this substance.

Results from the *Canadian Alcohol and Drug Use Monitoring Survey* reveal that, in 2009, 1.6% of Canadians aged 15 years and older have reported using *S. divinorum* at least once in their lifetime, with a much higher rate of use (7.3%) in youth aged 15-24.

And, the results from the *Canadian 2008-2009 Youth Smoking Survey* also show that 5% of 15 year olds have used *S. divinorum* in the past year.

Because of the potential risks to the health of Canadians, particularly young people, we are proposing to add *Salvia divinorum*, and its main active ingredient salvinorin A, to the *Controlled Drugs and Substances Act*.

These substances should be controlled, just like other illicit drugs.

As a first step, a notice was published in the *Canada Gazette* on this past weekend. That started a process during which all Canadians will have a 30-day period to comment on our proposal. While we are

consulting with Canadians, our position is clear. We want to help parents, families and communities to keep our kids safe.

Adding *salvia divinorum* to the list of controlled drugs and substances would make activities with *salvia*, such as possession, trafficking, importing or cultivating illegal.

And, these measures are in line with other countries, including but not limited to Australia, Belgium, Germany, Italy and Japan. All of these countries have placed similar controls on the import and/or sale of *salvia*.

The bottom line is that our teens face enough pressure already. And with heavily covered stories of young Hollywood using this *salvia* to get high, we have the responsibility to help protect our youth. In a fragile economy like this, Moms and Dads literally can't afford to always keep watch of what's happening.

We want to help Mom and Dad.

We're acting quickly on this because we want to protect our young people from the harms associated with *Salvia*.

We want to eliminate the misconceptions that *Salvia* is a safe alternative to street drugs.

It is not.

All of the steps we are taking are designed to protect the health and safety of Canadians from the potentially harmful effects of this substance. We know that parents want their children to be protected from substances like *Salvia*, particularly when they are in their teenage years.

I would now be happy to take your questions.

Thank you.

Hello,

The stakeholder list below has been MO approved.

HeCSB- please contact all stakeholders to advise them of this announcement.

Also please advise mbu by 10AM monday morning, which stakeholders will issue a positive news release.

Thank you,

Meghan Lax

Hi Lisa -

There is no template attached to this email. As well, the deadline given for the Stakeholder list is in  
January. Can you please clarify.

This request should be sent to HECSB\_Action Request\_48h, rather than HECSB\_Briefing.

Thank you,

Jesse

Subject Fw: Top 5 Recreational Drug Experiments-Salvia

Ronald sent me this, and I wonder if you can confirm that the Neuropharmacology paper mentioned below is one we have in our files; just means we perhaps have to be less equivocal with respect to mechanism of action now, i.e., not sure what our media lines say but I thought we had something in there about not being sure how salvia works??

pls follow up and change lines if necessary- now is the time given that they are still in approvals.....

will also be important for IAS

# Top 5 Recreational Drug Experiments

By Aaron Rowe  April 05, 2008 | 11:46:38 AM Categories: Chem Lab, Drugs & Alcohol, Neuroscience

Recreational drugs are a ridiculously fun topic for scientific research. They could also be the inspiration for powerful new medications. We are often amazed by the fascinating, and sometimes hilarious, stories that make their way into peer-reviewed journals. Here are some of our very favorites:

## 5. Harvard Scientists Build a Device to Smoke Weed During a Brain Scan

To better understand addiction, and how to treat it, scientists need to get a better look at the human brain as it is under the influence of weed. Unfortunately, smoking weed inside the narrow chamber of a functional MRI is not easy. To prevent smoke damage and allow their research subjects to puff without

moving around too much, Blaise Frederick and his team at Harvard built what amounts to a giant bong

#### 4. Stanford Chemists make THC from Scratch

Since 1965, chemists have been trying to make the active ingredient of marijuana [pdf]from scratch. Back then, the researchers could only make tetrahydrocannabinol along with its enantiomers -- impurities that have the same chemical composition, but a different shape. Then, in 2006, a pair of chemists from Stanford University used a Molybdenum catalyst and other sophisticated techniques to produce the coveted molecule in its pure form. Despite their discovery, mother nature is still the best chemist and closets with high-intensity lamps will outperform the most sophisticated laboratories.

#### 3. Researchers Learn How Salvia Works

Diviner's sage contains a powerful hallucinogen that may someday inspire a new class of depression, pain, and addiction medications. In at least one instance, a woman has used the substance to rid herself of depression. Tests on animals have shown that the Oxaccan plant, a relative of the culinary herb, can also control pain.

Last year, Catherine Willmore and her colleagues at Ohio Northern University ended a controversy about how the drug works. In the Sep. 2007 issue of *Neuropharmacology*, she confirmed that the active chemical, Salvinorin A, binds to signal-carrying proteins called kappa opioid receptors.

Willmore and her team trained rats to recognize the sensations caused by a well-understood drug that also targets kappa opioid receptors. It is impossible to know exactly how the rats felt during the test, but they could not tell the difference between the active chemical in sage and the one they had been trained to identify. Since the drugs feel the same, both of them must activate the same target.

#### 2. British Army Tests LSD on Soldiers

#### 1. Researchers Combine Chemicals from Sea Urchin Eggs and Weed to Make Powerful Painkillers

Scientists at organix, a small research and development firm, made hybrid molecules which resemble the euphoria-causing compounds THC and anandamide. In the Dec. 2007 issue of *Bioorganic and Medicinal*

## **Its Your Health Proposed Article**

It's Your Health articles answer frequently asked questions from the general public and provide health protection advice. Each IYH article is roughly 2 pages long, with a grade 8 to 10 "readability" level. The target audience is the general public, and plain language is used whenever possible. Links to detailed technical or scientific information can be provided in the "Need More Info?" section. These publications are distributed to: doctors and their clients, teachers and students, magazine editors and their subscribers, other federal and provincial departments, private firms, Health Canada and Public Health Agency of Canada employees. This publication is also posted on Health Canada and PHACs official Web sites.

**Author and Date of Proposal** - *Lisa Holmes - October 17, 2008*

**Proposed Title** - *Salvia divinorum*

**The Issue** - *Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.*

*Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.*

**Health Canada's Role** - *There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.*

**Why is this article needed and why It's Your Health ?-** *The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.*

**Are other communications products being considered, will they be used ?-**  
*Media lines.*

**Is there a deadline for producing the IYH article** - *While it is not part of a larger*

*announcement, it would be beneficial to have this article produced and posted as soon as possible, as there continues to be media attention and public interest on the issue.*

**Who in the department needs to provide input and who would be the lead contact ?-** *Andrew Adams, Director, Drug Analysis Services, HPFB (Darrin, please provide contact name).*

**Who in the department or outside of the department should approve this article?** - *Health Canada only.*

**Is there a plan for Stakeholder involvement or dissemination when article is completed?:** *No stakeholder plan - we will refer media to this article.*

Subject It's Your Health - article template

Hi Jocelyn,

As discussed, here is the template for the Salvia IYH article. If you have any questions, please feel free to give me a call.

Proposed Article Template - IYH for Salvia-D.wpd

Many thanks,  
Lisa

## **Its Your Health Proposed Article**

It's Your Health articles answer frequently asked questions from the general public and provide health protection advice. Each IYH article is roughly 2 pages long, with a grade 8 to 10 "readability" level. The target audience is the general public, and plain language is used whenever possible. Links to detailed technical or scientific information can be provided in the "Need More Info?" section. These publications are distributed to: doctors and their clients, teachers and students, magazine editors and their subscribers, other federal and provincial departments, private firms, Health Canada and Public Health Agency of Canada employees. This publication is also posted on Health Canada and PHACs official Web sites.

**Author and Date of Proposal** - *Lisa Holmes - October 17, 2008*

**Proposed Title** - *Salvia divinorum*

**The Issue** - *Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.*

*Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.*

**Health Canada's Role** - *There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.*

**Why is this article needed and why It's Your Health ?-** *The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.*

**Are other communications products being considered, will they be used ?-**  
*Media lines.*

**Is there a deadline for producing the IYH article** - *While it is not part of a larger*

*announcement, it would be beneficial to have this article produced and posted as soon as possible, as there continues to be media attention and public interest on the issue.*

**Who in the department needs to provide input and who would be the lead contact ?-** *Andrew Adams, Director, Drug Analysis Services, HECS; Ranjan Bose, Manager, Marketed Biologicals, Biotechnology and Natural Health Products Bureau, Marketed Health Products Directorate, and Dr. Helmi Hussien, A/Director, Bureau of Clinical Trials and Health Sciences, Natural Health Products Directorate, HPFB.*

**Who in the department or outside of the department should approve this article?** - *Health Canada only.*

**Is there a plan for Stakeholder involvement or dissemination when article is completed?:** *No stakeholder plan - we will refer media to this article.*

If you have any questions regarding this form please contact your Branch or Regional contact listed below:

Each IYH article is roughly 2 pages long, with a grade 10 to 12 "readability" level. The target audience is the general public, and we use plain language whenever possible.

We avoid giving information that is highly technical, but we can give links to detailed technical or scientific information in the "Need More Info?" section, if this would be helpful to the public.

The general template for the IYH format is as follows:

**The Issue** (Why we are telling people about this particular health issue)

**Background** (Context for the issue, and what people need to know to understand the issue)

**Health Effects** (Risks / Benefits or other considerations associated with the issue at hand. What are the health effects and who is at increased risk for health effects? What is known and what is unknown about the issue, etc.)

**Minimizing Your Risk** (What people can do to safeguard their own health)

**The Government's Role** (The steps, policies, or initiatives undertaken by Health Canada and/or the PHAC in relation to this issue in order to help Canadians maintain and improve their health)

**Need More Info?** (Links to Web sites or other sources of additional reliable information. Also, we sometimes include a mailing address or a toll-free telephone number to the HC area that would be fielding inquiries.)

# *Salvia divinorum*

## INFORMATION CONCERNING THE PLANT AND ITS ACTIVE PRINCIPLES

### TABLE OF CONTENTS

Executive Summary.....	1
Background.....	1
Description, Composition and Effects .....	2
Availability & Abuse Potential .....	2
Actual & Potential Medical Use .....	3
Scheduling Issues .....	4
Summary & Recommendations.....	4
Bibliography.....	5
Sources for Additional Information .....	6

### EXECUTIVE SUMMARY

The plant *Salvia divinorum* was virtually unknown to North Americans until recently. A New York Times article (Jones 2001) created a spike of interest in the plant as a legal hallucinogen along with internet sites such as [www.erowid.org](http://www.erowid.org). There has been a resurgence of public interest in ethnobotanical hallucinogens that are yet to be scheduled under the Controlled Drugs and Substances Act. Studies indicate that *S. divinorum* and/or its active principle may have "significant research and therapeutic potential in fields such as psychopharmacology, psychiatry and complementary disciplines such as herbal medicine" (Hanes 2001). Because its abuse potential is low and its medical potential significant, placement of *S. divinorum* or its active principle, salvinorin A, in a Schedule of the Controlled Drugs and Substances Act is currently unwarranted.

### BACKGROUND

Global flora is rife with species exhibiting psychoactive properties. A recent survey listed 250 plants that naturally produce either controlled drugs and/or substances (Ott 1993), and the overall number of psychoactive plant species is undoubtedly much larger. One among a multitude of lesser known psychoactive plants is *Salvia divinorum*, a plant native to the Sierra Mazateca in Mexico, and first introduced to the United States in 1962 (Hofmann 1990, Wasson 1962). *Salvia divinorum* is a member of the Labiatae or Mint family, one of the largest families of angiosperms, which includes many ornamental, culinary and medicinal herbs in common use throughout the world. Close relatives include the spices basil, mint (*Mentha*), common sage (*Salvia officianalis*), rosemary and thyme. This family is also a rich source of essential oils, including isomenthone, isopinocampnone, carvone, menthol, and methyl acetate. Many related species have been valued throughout history by the Assyrians, Babylonians, Chinese, Arabs, Greeks and Romans for their medicinal properties. These species are still utilized in this capacity by indigenous cultures around the globe, including Native Mexicans. As its name reflects, *Salvia divinorum* (translation: "Diviner's Sage" or "Sage of Seers") is traditionally employed by the Mazatec Indians in medico- magical- divination ceremonies (Epling & Játiva 1962). To the Mazatec, *S. divinorum* provides numerous therapeutic applications. Infusions of the plant are administered in a ceremonial context and are used for a variety of complaints, including diarrhea, headache, rheumatism and anemia. Mazatec shamans use *S. divinorum* as a vision inducing plant. They say it "allows them to travel to heaven and talk to God and the Saints about divination, diagnosis, and healing" (Rovinsky & Civadlo 1998).

### DESCRIPTION, COMPOSITION & EFFECTS

*Salvia divinorum* is also known, in Mazatec, as Ska Pastora or Ska María Pastora, meaning "Leaves of the Shepherdess" or "Leaves of Mary the Shepherdess." In Náhuatl it is named Pipiltzintzintli, and in Spanish, la Hembra or Hojas de Pastora. In English, it is commonly referred to as Magic Mint, or more properly by its direct translation from Latin, "Diviner's Sage" or "Seer's Sage." The plant is a sprawling perennial herb with flowering stems growing two or even three meters tall. This plant has never been observed to set seed in the wild, and can be found to flower, from May to September, in white with a light blue tinge.

#### AVAILABILITY & ABUSE POTENTIAL

*Salvia divinorum* is endemic only to the Mazatec zone of the Sierra Madre Oriental, in the Mexican state of Oaxaca. It is propagated vegetatively, and because the only specimens observed in its native habitat were known to be planted by Mazatecs, it is assumed by most to be a cultigen. Cultivation in more northern latitudes has been accomplished, but it is difficult, demanding a high degree of technical skill. The plant requires rich soil and abundant moisture, tolerating sun only if soil moisture remains high and humidity is sustained. Numerous Internet sites provide descriptions of *S. divinorum* and its mind altering powers. Some of the sites accentuate the unpleasant and antisocial effects of using *S. divinorum*, while others describe the "spiritual dimension" of its traditional use. Some Internet sites are used to post information about its cultivation and use, and a few herbalists conduct business online selling cuttings and leaf. Interestingly, many Internet postings recounting personal experiences include stern warnings regarding the plant's potentially disturbing psychoactive effects.

Accounts of serious medical consequences or statistics on emergency visits related to use of the plant or chemical are virtually nonexistent. No citations were uncovered in a search of the Morbidity and Mortality Weekly Report. The Toxic Exposure Surveillance System (TESS) maintained by the American Association of Poison Control Centers has no reports of *S. divinorum* specific poisonings. (Litovitz 2000). No cases of dependency on *S. divinorum* or salvinorin A are reported in the literature. Aside from rare reports of pervasive anxiety associated "bad" experiences with their usage, no cases of psychotic deterioration or other medical complications are known. Any danger from the use of the plant or chemical arises from anxiety reactions, or the possibility of accidents secondary to users ambulating or pursuing other activities while visually impaired. Anxiety reactions are generally self-limited due to the brief duration of effects, and respond to quiet reassurance. Additionally, extraneous noise or even opening the eyes may totally terminate the psychoactive effects. Unlike other dissociative plant agents subject to occasional recreational use, such as *Brugmansia* spp. (Angel's Trumpet) or *Ipomoea* spp. (Morning Glory), *Salvia divinorum* and its active ingredient salvinorin A are short acting and lack any known tissue toxicity, gastrointestinal or cardiovascular sequelae.

## ACTUAL & POTENTIAL MEDICAL USE

For centuries, the Mazatec Indians have used the plant *Salvia divinorum* in healing ceremonies, gaining relief from anaemia, headache, and rheumatism (Valdés 1983). Until very recently, the precise neurotransmitter receptors used by salvinorin A were unknown, despite a battery of NovaScreen® tests. However, in Fall 2002 a team of researchers published their findings that Salvinorin A is a potent kappa opioid receptor agonist (Roth 2002). The researchers noted that salvinorin A's affinity for kappa opioid receptors was surprising and that this held promise for developing entirely new psychiatric medicines: Salvinorin A thus represents, to our knowledge, the first naturally occurring nonnitrogenous opioid- receptor subtype selective agonist. Kappa opioid receptor interactions produce spina analgesia, sedation, miosis, diuresis, mild respiratory depression, and low addiction liability. Because Salvinorin A is a psychotomimetic selective for kappa opioid receptors, kappa opioid- selective antagonists may represent novel psychotherapeutic compounds for diseases manifested by perceptual distortions (e.g., schizophrenia, dementia, and bipolar disorders) (Roth 2002). An article in the Journal of Clinical Psychopharmacology reported on "Ms. G" a 26- year- old woman with a history of unrelenting depression, who eventually found relief in *Salvia divinorum*. Having found that other medications failed to provide satisfactory relief, Ms. G self-medicated with an oral dose of *Salvia divinorum* leaves three times per week. As a result of her use of *Salvia divinorum*, "she has continued to show a total remission of her symptoms of depression and has maintained this improvement for the last 6 months, showing no signs of relapse and reporting only minimal side effects, such as occasional lightheadedness for up to 1 hour after using the herb" (Hanes 2001). The author of the Case Report concluded .it is not inconceivable that research using the active ingredients from this herb may pinpoint a unique mechanism of antidepressant action for these compounds. This, in turn, could lead to methods for the management of depression or of treatment resistant subtypes of this condition. . We may be dealing with a highly novel agent that has significant research and therapeutic potential in fields such as psychopharmacology, psychiatry and complementary disciplines such as herbal medicine" (Hanes 2001).

Despite its availability to science over the last few decades, investigation and use of *S. divinorum* or its primary psychoactive substance, salvinorin A (a diterpenoid agent devoid of nitrogen), remain quite limited. Salvinorin A is a complex molecule made up of some 59 molecules in its structure. Examination of the PubMed database of the National Library of Medicine results in only five citations (Giroud 2000, Valdés 1994, Siebert 1994, Valdés 1986, and Valdés 1983). There are several reasons why so little information about either *S. divinorum* or salvinorin A exists in the medical literature. Firstly, until August 2002, the precise neurotransmitter receptors with an affinity for salvinorin A were unknown. In August 2002, however, a team of researchers published their findings that salvinorin A binds to kappa opioid receptors. (Roth 2002). Secondly, cultivation of *S. divinorum* is relatively exacting, and commerce in the plant is presently limited. Thirdly, the plant and chemical seem to have little innate toxicity. Animal studies stimulate decreases in movements without sedation (Valdés 1994). Administration of huge doses of salvinorin A to rats produced no observable subsequent sequelae on behavior (Valdés 1987). More importantly, *S. divinorum* is uniformly acknowledged as a difficult agent to employ, with a steep "learning curve." It is virtually inactive orally because salvinorin A is insoluble in water. The intense bitterness of the leaves is a hindrance to many, while smoking the leaves requires rapid inhalation of large volumes of smoke. The plant's psychoactive effects are inconsistent and fleeting. Even the isolated chemical is associated with very transient effects in humans. Few consider the psychoactive effects pleasurable, and most people choose not to repeat the experience after one exposure. Many describe the appearance of geometric shapes in the vision, while at higher doses, a brief dissociative effect, "out- of- body experience," or true hallucination may be produced.

### SCHEDULING ISSUES

*Salvia divinorum* is not scheduled under the Controlled Drugs and Substances Act, nor is it controlled under any regulations. Its active principle, salvinorin A, is likewise unscheduled under Federal law. The diterpene that is responsible for the action of the plant is totally dissimilar from any other scheduled drug or substance. Salvinorin A's chemical structure appears to be unique among other psychoactive molecules, and among existing controlled substances (Valdés 1994). Because it is not "substantially similar" in chemical structure to an existing controlled substance, salvinorin A can not be classified as an analogue under the CDSA or any regulations.

### SUMMARY & RECOMMENDATIONS

*Salvia divinorum* is a psychoactive plant, which until recently remained unknown to all but a specialized division of ethnobotanists. The plant's bitter taste, unpredictable and occasionally disturbing short term psychoactive effects, combined with exacting cultivation parameters; make it an unlikely candidate for widespread use. While news coverage periodically produces a spike of interest in the plant as a "legal hallucinogen," use of the plant is not expected to ever reach the level experienced with other illegal drugs. Neither *S. divinorum* nor salvinorin A have a "high potential for abuse," and recent scientific studies, supported by ethnobotanical data, strongly suggest possible therapeutic applications. Accordingly, neither the plant nor its active principle, are appropriate candidates for placement in the CDSA. Monitoring of abuse patterns should continue, however, education aimed at raising awareness of the plant's unpredictable and occasionally upsetting psychoactive effects, rather than criminal prohibition, is key to reducing individual and social harm with respect to *Salvia divinorum* and its active component.

In order to place *S. divinorum* or salvinorin A in a schedule of the Controlled Drugs and Substances Act, several criteria must be satisfied. The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual and to society when diverted or misused. In determining whether a substance should be added to the CDSA, and into which schedule, HC considers several factors including: (1) international requirements regarding the control of the substance; (2) dependence potential and likelihood of abuse/misuse of the substance; (3) extent of actual abuse/misuse in Canada and elsewhere; (4) danger the substance represents to the safety of the public; (5) usefulness of the substance as a therapeutic agent; (6) industrial and commercial usefulness; and (7) chemical similarity with

substances currently scheduled in the CDSA. *Salvia divinorum* remains un-scheduled in many countries including the United States and the United Kingdom. Placement of the plant or chemical in the CDSA cannot be scientifically justified. The plant and chemical have minimal abuse potential and no addictive potential. Recent studies published in scientific journals have emphasized that further studies with salvinorin A and/or *S. divinorum* may lead to the development of "novel psychotherapeutic compounds" (Roth 2002) with "significant research and therapeutic potential in fields such as psychopharmacology, psychiatry and complementary disciplines such as herbal medicine" (Hanes 2001). These findings are supported by ethnobotanical data. Available data supports the safety of using *S. divinorum* or salvinorin A under medical supervision. CDSA status for salvinorin A or its parent plant could inhibit scientific research that has the potential to understand novel neurotransmitter systems of great importance to neuropharmacological research and the treatment of disease.

Hi Darrin,

Has Sue Lumsden touched base with you? Just checking in to make sure we are moving forward with the IYH. I know the the Drug Strategy group here is very anxious to move forward with this...

Please let me know.

Thanks,  
Lisa

No they didn't, but I'm not surprised at their input. This has cropped up in relation to a couple of other risk communications over the years. I always counter by saying that it is better to tell people about the risks. If

they read our advice and ignore it, that's their decision. Better than them saying they had no idea it was a potential danger. And in this case, information about the effects of salvia is already widely available to anyone on the Internet.

How do you want to proceed? Would you like me to talk to Shahid?

Cheers,  
Darrin

Subject Fw: It's Your Health article on Salvia divinorum

Hi Lisa,

The email message below from Shahid Perwaiz (MHPD) outlines his concern that posting an It's Your Health article on Salvia divinorum, which would feature information about its hallucinogenic properties and the current legal status, might result in more teenagers finding out about / seeking out this substance.

I gather that when you circulated the Proposal to the IYH Editorial Board, no one raised this issue as a potential downside to producing the article. However, as you'll see below, Shahid believes that the Editorial Board should be made aware of this possibility so that they may further consider whether or not the article should go forward.

Thanks.

Sue

Subject: It's Your Health article on Salvia divinorum

> Hi Sue,

>

> As I indicated to you during our telephonic conversation that my only concern regarding issuing an IYH on Salvia divinorum would be if we choose to inform public about its hallucinogenic properties and its legal status in Canada, this would likely create a promotional effect and could result in more adolescents seeking out Salvia from its currently easy access.

>

> I know that the proposal for the It's Your Health (IYH) article on Salvia divinorum has already been approved by the IYH Editorial Board, but it would be appropriate to bring the above-mentioned concern to the Editorial Board attention for their consideration.

## **Media Lines**

### **Regulatory Control of *Salvia Divinorum***

#### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to help determine what, if any, regulatory controls are needed.
- While the media has reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

#### **Supplementary Messages:**

##### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, is controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- In Canada, *Salvia divinorum* under some conditions of use meets the definition of a natural health product under the *Natural Health Products Regulations*. This means that a product making health claims that contains *Salvia divinorum* must be approved by Health Canada prior to being sold in Canada. Products that don't comply with the regulations may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not approved any *Salvia divinorum* products for sale in Canada.

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – There are very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans, and using these studies to predict its potential for addiction and abuse is difficult. The mechanism of action by which *Salvia divinorum* works is still not fully understood from the existing information, and more controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;

- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Addiction liability and potential for abuse/misuse of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally;  
and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – Health Canada maintains an active file on this topic. Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

**Q5 – Has Health Canada received any reports of adverse reactions related to the use of *Salvia divinorum*?**

A5 -- Since 2005, Health Canada has received four reports of adverse reactions associated with the use of *Salvia divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required).

Where did these reports come from?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. The effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were 3 times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

~~*Salvia divinorum* is widely touted on the Internet as a "legal" alternative to street drugs.~~

The mechanism of action by which *Salvia divinorum* works is not fully understood. While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience is quite unique.

Subject Fw: It's Your Health - Salvia divinorum - Draft One

May I suggest that we try and provide one set of comments for Sue to work from? Perhaps if everyone could provide comments to Cheryl, she can collate and then circulate for all to agree on before we pass on to Sue. Just might be easier for Sue to work from.

Let me know.

Subject It's Your Health - Salvia divinorum - Draft One

Good afternoon,

With apologies for the delay since we spoke about this issue, I'm forwarding a first draft of the It's Your Health (IYH) article on Salvia Divinorum.

When reviewing this document, please keep in mind that IYH is geared towards an audience with grade 10-12 literacy skills. We try to use plain language and a conversational tone. I realize this draft is quite simplistic in content, especially when compared to Brittany's research paper.

The usual process with IYH is for the draft to go back and forth between the writer and the Program contacts until you are satisfied with the content and tone of the article, at which point it is forwarded to the IYH Manager (Lisa Mackay) to begin the formal approvals process.

I'll be happy to work with you on revisions via e-mail or telephone, whichever you prefer.

Thank you. I look forward to seeing or hearing your comments on this first draft.

Sue

## **Salvia Divinorum**

### **The Issue**

Certain Web sites are promoting the use of *Salvia divinorum* as a “legal” alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make tea to treat such conditions as headache or stomach upset, or to produce a “mystical” experience.

Products that claim to contain *Salvia divinorum* – or its main active ingredient, Salvinorin A – are widely available on the Internet and are sold in various “head shops” and corner stores. These products are sold in a number of formats, including seeds, plant cuttings, fresh or dried leaves and liquid extracts, and are intended to be either chewed, swallowed or smoked. Street names for *Salvia divinorum* include: diviner’s sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* to get “high,” but so far, there has been no solid research in Canada on actual use.

Health Canada has not approved any *Salvia* products for sale in Canada. However, neither *Salvia divinorum* nor Salvinorin A is controlled in Canada under the *Controlled Drugs and Substances Act*.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. A number of individual states have done this as well, but *Salvia divinorum* is not regulated under the *Controlled Substances Act* in the United States.

### **Risks associated with using *Salvia Divinorum***

The use of *Salvia divinorum* distorts reality. The effects vary from person to person, and may include the following:

- hallucinations (“seeing” objects that are not there)
- out-of-body experiences
- loss of consciousness
- short-term memory loss

- uncontrollable laughter
- loss of ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one experience to the next, depending on such factors as the potency of the product, how much was used, whether it was ingested or smoked, and the user's mood and expectations.

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- whether it is toxic
- precisely how it acts on the brain
- how long it acts on the brain and whether there are permanent effects
- whether it causes physical or psychological dependence
- how it interacts with other substances (including drugs and alcohol)

Also, since no *Salvia divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware."

### **The Legal Status of *Salvia Divinorum***

From time to time, Health Canada is asked why *Salvia divinorum* and Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage risks. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

## **Minimizing Your Risk**

Health Canada recommends that you avoid using *Salvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Drug Identification Number - Homeopathic Medicine (DIN-HM) or
- a Natural Product Number (NPN)

These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *Salvia* products have been approved by Health Canada.

## **Health Canada's Role**

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum* and to control the availability of this substance.

## **Need More Info?**

Subject Re: Fw: Top 5 Recreational Drug Experiments-Salvia

History: This message has been forwarded.

**Yeah, I remember going over that in my head the last chance we got before these were finalized and what I should do in regards to that... But in hindsight, I would take it out. See my comments below.**

**Q1 – If Health Canada is aware of *Salvia divinorum* 's ill-effects, why isn't it illegal?**

A - Human studies that demonstrate reliable, systematic and controlled observations on the physical and psychotropic effects of *Salvia divinorum* are sparse, and using these studies to predict its potential for addiction and abuse is difficult . The information currently available to Health Canada indicates that the likelihood of abuse/misuse of *Salvia divinorum* is unknown? (if we want to be really picky, I also addressed this in my report... and based on its pharmacology, this is not *unknown*. We know that it is a KOR agonist and by virtue of that should be a low abuse liability), ~~t hat the mechanism of action by which *Salvia divinorum* works is still not fully understood,~~ and that more controlled systematic research in this area is needed.

~~The mechanism of action by which *Salvia divinorum* works is not fully understood.~~ (It was in this context that I felt there was some play... because people have very different experiences on the drug which have led to the idea that there might be more than just KOR at play.. or salviorin... But yes, just take it out). While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens such as LSD and phencyclidine, the overall experience is quite unique.

Ronald sent me this, and I wonder if you can confirm that the Neuropharmacology paper mentioned below is one we have in our files; just means we perhaps have to be less equivocal with respect to mechanism of action now, i.e., not sure what our media lines say but I thought we had something in there about not being sure how salvia works??

pls follow up and change lines if necessary- now is the time given that they are still in approvals.....

will also be important for IAS

# Salvia Divinorum - Draft One

## The Issue

Certain websites are also promoting the use of *Salvia divinorum* (*S. divinorum*) as a "legal" alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about how it acts on the brain, and there is no way to predict how it will affect you.

- Deleted: W
- Deleted:
- Formatted: Font: Italic
- Deleted: the extent of adverse effects

## Background

Note: We feel that the Background section would flow better if some of the information was moved to other sections in the document. Please see suggestions in comments on right-hand side.

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to induce a "mystical" or hallucinogenic experience.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores, etc. These products are sold in a number of formats, including seeds, and plant cuttings for propagation purposes. Fresh or dried leaves are intended to be either chewed, swallowed or smoked; liquid preparations are also available for consumption. Street names for *S. divinorum* include: diviner's sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* specifically for its ability to produce hallucinations (i.e. "seeing" object that are not there).

Health Canada has not approved any *S. divinorum* products for sale in Canada. However, neither *S. divinorum* nor salvinorin A are controlled in Canada under the *Controlled Drugs and Substances Act*.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, *S. divinorum* is not regulated under the *Controlled Substances Act*, although a number of individual states have placed restrictions on its sale and/or import. For example, several states have placed *S. divinorum* and/or salvinorin A into Schedule I of state law, thereby making it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have enacted other forms of legislation restricting distribution of the plant.

### Risks Associated With Using *Salvia Divinorum*

*S.* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- how it is taken (e.g. ingested or smoked)
- the user's mood and expectations.

*S. divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

Also, since no *S. divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware."

### The Legal Status of *Salvia Divinorum*

Note: Would start with a clear statement about the fact that *Salvia divinorum* is not regulated as a controlled substance in Canada at the present time and then would move to status in other countries. We also need to explain the fact that *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations*, but no NHPs containing *Salvia divinorum* have been approved.

From time to time, Health Canada is asked why *S. divinorum* and salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a

substance under the *Controlled Drugs and Substances Act* (CDSA), Health Canada considers the following factors:

Deleted: many factors, including

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.

Deleted: alvia

Comment: Suggest removing this sentence as it is not just law enforcement that is responsible for judging public safety.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

Comment: Suggest moving to HC's Role section.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Deleted: alvia

Also, remember that just because a drug is plant-based or "natural," does not mean it is safe. Natural health products that have been approved by Health Canada will be labelled with one of the following:

## Salvia Divinorum

### The Issue

Certain Web sites are promoting the use of *Salvia divinorum* (*S. divinorum*) as a “legal” alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### Background

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, these are effects on the mind. ~~which means it is capable of acting on the mind.~~

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to produce a “mystical” experience.

Products that claim to contain *S. ~~alvia~~ divinorum* – or its main active ingredient, ~~s~~Salvinorin A – are widely available on the Internet and are sold in various “head shops” and corner stores (?-I am not sure that this is appropriate? Mainly herbal shops I think... right?). These products are sold in a number of formats, including seeds, plant cuttings, fresh or dried leaves and liquid extracts, and are intended to be either chewed, swallowed or smoked. Street names for *S. ~~alvia~~ divinorum* include: diviner’s sage, ~~m~~Magic mint, ~~m~~Maria pastra, puff encens special, ska pastora, ska ~~m~~Maria pastora, ~~s~~Sally D, ~~H~~ady ~~s~~Sally and ~~s~~Salvia.

---

Recently, there have been reports suggesting that Canadian teens and young adults are using *S. ~~alvia~~ divinorum* to get “high,” but so far, there has been no solid research in Canada on its actual use.

Health Canada has not approved any *S. divinorum*~~Salvia~~ products for sale in Canada. However, neither *S. ~~alvia~~ divinorum* nor ~~s~~Salvinorin A is controlled in Canada under the *Controlled Drugs and Substances Act*.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. ~~alvia~~ divinorum*. A number of individual ~~Ss~~(?)tates have done this as well, but *S. ~~alvia~~ divinorum* is not regulated under the *Controlled Substances Act* in the United States.

### Risks associated with using *Salvia Divinorum*

The use of *S. ~~alvia~~ divinorum* distorts reality. The effects vary from person to person, and may

## Brittany Sauvé - Comments

include the following:

- hallucinations (“seeing” objects that are not there)
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- loss of ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use experience to the next, depending on such factors such as:

- ~~the~~ potency of the product,
- how much was used
- how it is taken (e.g. ingested or smoked), ~~whether it was ingested or smoked, and~~
- the person ~~user~~'s mood and expectations:

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- ~~whether it is toxic~~ (everything is toxic)
- ~~precisely how it affects~~ acts on the brain and if it causes permanent damage ~~how long it acts on the brain and whether there are permanent effects~~
- whether it causes physical or ~~psychological~~ dependence or addiction
- how it interacts with other substances (including drugs and alcohol)

Also, since no *S. alvia divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be ~~counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is~~ always a matter of “buyer beware.”<sup>22</sup>

## The Legal Status of *Salvia Divinorum*

From time to time, Health Canada is asked why *S. alvia divinorum* and ~~s~~Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

## Britanny Sauvé - Comments

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the risks. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. (This sentence sounds odd a bit because its not just law enforcement that can judge public safety) However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.

Questions about the use of *S. atvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. atvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural;" this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Drug Identification Number - Homeopathic Medicine (DIN-HM) or
- a Natural Product Number (NPN)

These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *S. divinorum* *Salvia* products have been approved by Health Canada.

---

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. atvia divinorum* and to control the availability of this substance.

### **Need More Info?**

## **Salvia Divinorum**

### **The Issue**

Certain Web sites are promoting the use of *Salvia divinorum* as a “legal” alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make tea to treat such conditions as headache or stomach upset, or to produce a “mystical” experience.

Products that claim to contain *Salvia divinorum* – or its main active ingredient, Salvinorin A – are widely available on the Internet and are sold in various “head shops” and corner stores. These products are sold in a number of formats, including seeds, plant cuttings, fresh or dried leaves and liquid extracts, and are intended to be either chewed, swallowed or smoked. Street names for *Salvia divinorum* include: diviner’s sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* to get “high,” but so far, there has been no solid research in Canada on actual use.

---

Health Canada has not approved any *Salvia* products for sale in Canada. However, neither *Salvia divinorum* nor Salvinorin A is controlled in Canada under the *Controlled Drugs and Substances Act*.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. A number of individual states have done this as well, but *Salvia divinorum* is not regulated under the *Controlled Substances Act* in the United States.

### **Risks associated with using *Salvia Divinorum***

The use of *Salvia divinorum* distorts reality. The effects vary from person to person, and may include the following:

- hallucinations (“seeing” objects that are not there)
- out-of-body experiences
- loss of consciousness
- short-term memory loss

- uncontrollable laughter
- loss of ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one experience to the next, depending on such factors as the potency of the product, how much was used, whether it was ingested or smoked, and the user's mood and expectations.

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- whether it is toxic
- precisely how it acts on the brain
- how long it acts on the brain and whether there are permanent effects
- whether it causes physical or psychological dependence
- how it interacts with other substances (including drugs and alcohol)

Also, since no *Salvia divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware."

### **The Legal Status of *Salvia Divinorum***

From time to time, Health Canada is asked why *Salvia divinorum* and Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- 
- international requirements and trends in controlling the substance
  - similarity to other substances already regulated under the CDSA
  - whether there may be legitimate uses of the substance (e.g., potential health benefits)
  - the potential for addiction and abuse/misuse of the substance
  - the extent of actual abuse and misuse of the substance in Canada and elsewhere
  - overall risk to public health and safety posed by the substance

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage risks. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

## Minimizing Your Risk

Health Canada recommends that you avoid using *Salvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Drug Identification Number - Homeopathic Medicine (DIN-HM) or
- a Natural Product Number (NPN)

These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *Salvia* products have been approved by Health Canada.

## Health Canada's Role

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum* and to control the availability of this substance.

## **Salvia Divinorum**

### **The Issue**

Certain Web sites are promoting the use of *Salvia divinorum* as a "legal" alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting having an influence on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make tea to treat such conditions as headache or stomach upset, or to produce a "mystical" experience.

Products that claim to contain *Salvia divinorum* – or its main active ingredient, Salvinorin A – are widely available on the Internet and are sold in various "head shops" and corner stores. These products are sold in a number of formats, including seeds, plant cuttings, fresh or dried leaves and liquid extracts, and are intended to be either chewed, swallowed or smoked. Street names for *Salvia divinorum* include: diviner's sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* specifically for its ability to produce hallucinations (i.e. "seeing" objects that are not there), to get "high," but so far, there has been no solid research in Canada on actual use.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. These survey results will help fill some of the information gaps, but the data will not likely be available until 2010. (2008 Canadian Alcohol and Drug Use Monitoring Survey too? - only general open-ended question - not specific to Salvia)

~~Health Canada has not approved any Salvia products for sale in Canada. However~~ In Canada, neither *Salvia divinorum* nor Salvinorin A is are controlled in Canada under the *Controlled Drugs and Substances Act*. *Salvia divinorum* does meet the definition of a natural health product under the *Natural Health Product Regulations*, which means that a product that contains *Salvia divinorum* must be approved by Health Canada prior to being sold in Canada. Health Canada has, however, not approved any Salvia products for sale in Canada.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. A number of

Cheryl Tremblay - Comments

individual U.S. states have done this as well, but *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

### **Risks associated with using *Salvia Divinorum***

The use of *Salvia divinorum* distorts reality. The effects vary from person to person, and may include the following:

- hallucinations (~~“seeing” objects that are not there~~)
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- loss of ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one experience to the next, depending on such factors as the potency of the product, how much was used, whether it was ingested or smoked, and the user's mood and expectations.

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- whether it is toxic
- precisely how it acts on the brain
- how long it acts on the brain and whether there are permanent effects
- whether it causes physical or psychological dependence
- ~~how it interacts with other substances (including drugs and alcohol)~~

Also, since no *Salvia divinorum* products have been approved for sale in Canada, ~~products that claim to contain this substance~~ and thus have not been reviewed by Health Canada. ~~As such, they may be counterfeit or may contain other ingredients that pose risks to health.~~ In cases like this, it is always a matter of “buyer beware.”

### **The Legal Status of *Salvia Divinorum***

From time to time, Health Canada is asked why *Salvia divinorum* and Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)

Cheryl Tremblay - Comments

- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage risks. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.

~~Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.~~

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *Salvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Drug Identification Number - Homeopathic Medicine (DIN-HM) or
- a Natural Product Number (NPN)

~~These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *Salvia divinorum* products have been approved by Health Canada.~~

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum* and to control the availability of this substance.

## **Salvia Divinorum**

### **The Issue**

Certain Web sites are promoting the use of *Salvia divinorum* as a “legal” alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make tea to treat such conditions as headache or stomach upset, or to produce “mystical” or hallucinogenic experiences.

Products that claim to contain *Salvia divinorum* – or its main active ingredient, Salvinorin A – are widely available on the Internet and are sold in various “head shops” and corner stores. These products are sold in a number of formats, including seeds; and plant cuttings for propagation purposes. ~~†Fresh or dried leaves and liquid extracts;~~ are intended to be either chewed, swallowed or smoked; liquid preparations are also available for consumption. Street names for *Salvia divinorum* include: diviner’s sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

~~Recently, there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* to get “high,” but so far, there has been no solid research in Canada on actual use.~~

Health Canada has not approved any ~~Salvia~~ *Salvia divinorum* products for sale in Canada.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. ~~A number of individual states have done this as well, but~~ *Salvia divinorum* It is not regulated under the *Controlled Substances Act* in the United States but a number of individual states have placed restrictions on its sale.

### **Risks associated with using *Salvia Divinorum***

The use of *Salvia divinorum* distorts reality. The effects vary from person to person, are often described as unpleasant, and may include the following:

- hallucinations (“seeing” objects that are not there);

### Valerie Hurry - Comments

- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one experience to the next, depending on such factors as the potency of the product, how much was used, whether it was ingested or smoked, and the user's mood and expectations. It does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- whether it is toxic;
- precisely how it acts on the brain;
- how long it acts on the brain and whether there are permanent effects;
- whether it causes physical or psychological dependence (unlikely according to the evidence available so far);
- how it interacts with other substances (including drugs and alcohol).

Also, since no *Salvia divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware."

---

### The Legal Status of *Salvia divinorum*

From time to time, Health Canada is asked why *Salvia divinorum* and Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits);
- the potential for addiction and abuse/misuse of the substance;
- the extent of actual abuse and misuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage risks. ~~To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public~~

## Valerie Hurry - Comments

~~safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.~~

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *Salvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

reversed order of NPN and DIN-HM

These numbers indicate that the product's quality, safety and efficacy, including labelling and instructions for use, have been reviewed. As stated earlier, no *Salvia divinorum* products have been approved by Health Canada.

---

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum* and to control the availability of this substance.

### **Need More Info?**

For information about Health Canada's Drug Strategy and Controlled Substances Programme, go to: <http://www.hc-sc.gc.ca/ahc-asc/branch-dirigen/hecs-dgsesc/dscsp-psasc/index-eng.php>

Also, see the section on Prevention on the Government of Canada's National Anti-Drug Strategy Web site at: <http://www.nationalantidrugstrategy.gc.ca/>. This site has a number of helpful resources for parents, including "Tips on Talking to Your Teenager" and "What to do if Your Teen is using Drugs."

Some reports indicate that the consumption of salvia can ~~cause~~ adverse effects like

Q: What network about some comment like "A street" names Salvia Ann, Diviner's Sage, Nir

### Salvia Divinorum

#### The Issue

① Add websites (alone word)   
 ② Certain websites are promoting the use of *Salvia divinorum* (*S. divinorum*) as a "legal" alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about ~~the extent of adverse effects~~, and there is no way to predict how it will affect you.   
 how it acts on the brain,

#### Background

*Salvia divinorum* is a species of sage that belongs to the mint family. ~~It is known to have psychotropic effects, these are effects on the mind.~~

Wait bring water

The leaves of this plant ~~are~~ used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to produce a "mystical" or hallucinogenic experiences.   
 induce what about natural stores etc?

① Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops". These products are sold in a number of formats, including seeds, plant cuttings for propagation purposes. Fresh or dried leaves are intended to be either chewed, swallowed or smoked; liquid preparations are also available for consumption. Street names for *S. divinorum* include: diviner's sage, magic mint, maria pastra, puff encens special, ska pastora, ska maria pastora, sally D, lady sally and salvia.

this could not be a statement in place of other line

Recently, there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* specifically for its ability to produce hallucinations (i.e. "seeing" objects that are not there), but so far, there has been no solid research in Canada on its actual use.

Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not be available until 2010. (2008 Canadian Alcohol and Drug Use Monitoring Survey too?)   
 to HC role

see note below

Health Canada has not approved any *Salvia divinorum* products for sale in Canada. In Canada, neither *S. divinorum* nor salvinorin A are controlled, under the *Controlled Drugs and Substances Act*. *Salvia divinorum* does meet the definition of a natural health product under the *Natural Health Product Regulations*, which means that a product that contains *Salvia divinorum* must be approved by Health Canada prior to being sold in Canada. Health Canada has, however, not approved any *Salvia* products for sale in Canada.

para is repetitive and quite frankly confusing also goes better with the legal status   
 Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. A number of individual

Note: Order of background is very confusing and has no "flow" to it ... would suggest starting with eliminating some info that is really not background but more about HC's role etc/ legal status   
 (can't see SWEL questions like this!!)

Move 1 and 2 to Legal Status

1  
2

U.S. States have done this as well, but *S. divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

In the United States, salvia is ~~not regulated under the *Controlled Substances Act* in the United States~~ although a number of individual states have placed restrictions on its sale and/or import, e.g. add

**Risks Associated with Using *Salvia Divinorum***

*Salvia divinorum* acts as a hallucinogen which means that it distorts reality. The effects vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- how it is taken (e.g. ingested or smoked)
- the person's mood and expectations

It does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction (unlikely according to the evidence available so far)
- how it interacts with other substances (including drugs and alcohol)

Also, since no *S. divinorum* products have been approved for sale in Canada, and thus have not been reviewed by Health Canada, they may be counterfeit or may contain other ingredients that pose risks to health.

**The Legal Status of *Salvia Divinorum***

From time to time, Health Canada is asked why *S. divinorum* and salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

Salvia

too complicated for this doc

would start with clear statement about fact that not regulated as uncontrolled substance at the present time. States in other countries then move to

Also need to explain whole meets a

factors:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not be available until 2010.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *S. divinorum* products have been approved by Health Canada.

### Health Canada's Role

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum* and to control the availability of this substance.

### Risks Associated With Using *Salvia Divinorum*

*S.* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- how it is taken (e.g. ingested or smoked)
- the user's mood and expectations.

*S. divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

Also, since no *S. divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware." (Remove)

### The Legal Status of *Salvia Divinorum*

Note: Would start with a clear statement about the fact that *Salvia divinorum* is not regulated as a controlled substance in Canada at the present time and then would move to status in other countries. We also need to explain the fact that *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations*, but no NHPs containing *Salvia divinorum* have been approved.

From time to time, Health Canada is asked why *S. divinorum* and salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a

substance under the *Controlled Drugs and Substances Act* (CDSA), Health Canada considers the following factors:

Deleted: many factors, including

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use. (Remove)

Deleted: alvia

Comment: Suggest removing this sentence as it is not just law enforcement that is responsible for judging public safety.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010. (HC's Role)

Comment: Suggest moving to HC's Role section.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject Re: Fw: Top 5 Recreational Drug Experiments-Salvia 

History:

 This message has been forwarded.

Yeah, I remember going over that in my head the last chance we got before these were finalized and what I should do in regards to that... But in hindsight, I would take it out. See my comments below.

**Q1 – If Health Canada is aware of *Salvia divinorum* 's ill-effects, why isn't it illegal?**

A - Human studies that demonstrate reliable, systematic and controlled observations on the physical and psychotropic effects of *Salvia divinorum* are sparse, and using these studies to predict its potential for addiction and abuse is difficult . The information currently available to Health Canada indicates that the likelihood of abuse/misuse of *Salvia divinorum* is unknown? (if we want to be really picky, I also addressed this in my report... and based on its pharmacology, this is not *unknown*. We know that it is a KOR agonist and by virtue of that should be a low abuse liability), ~~t hat the mechanism of action by which *Salvia divinorum* works is still not fully understood~~, and that more controlled systematic research in this area is needed.

~~The mechanism of action by which *Salvia divinorum* works is not fully understood.~~ (It was in this context that I felt there was some play... because people have very different experiences on the drug which have led to the idea that there might be more than just KOR at play.. .or salviorin... But yes, just take it out). While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens such as LSD and phencyclidine, the overall experience is quite unique.

Subject Re: Fw: Top 5 Recreational Drug Experiments-Salvia

History: This message has been forwarded.

Yes, I know where you are coming from. This is something that I have struggled with too as it's an oversimplification of the information. In my report you will see that I say that the mechanism of action of salvinorin A is as a potent KOR agonist. This is not really new information... the paper you send reinforces its action as an agonist on that receptor. What is unknown is if this exactly how it exerts its action as a psychomimetic... that is still up in the air... given people's individual responses/experiences on the drug.

I will have a look at this... I know that it was in the media lines and I questioned whether or not it should stay that way. I don't believe I took it out... Upon looking at it again, I think that you might be right... it might be an oversimplification that leads people to think that there is no information around this that exists... when for salvinorin A the information is clear.

When i review the document I will decide how to present that...

Thank you for the question... it's definitely an issue... and plain language is never kind to our scientific documents!

Received 2 April 2007; received in revised form 4 June 2007; accepted 8 June 2007

### Abstract

Data from clinical and preclinical studies converge implicating the plant-derived hallucinogen salvinorin A as an important pharmacologic tool; this psychoactive compound may expand scientific understandings on mammalian  $\kappa$ -opioid receptor systems. Human salvinorin A effects, consistent with  $\kappa$ -opioid receptor agonism, include antinociception, sedation, dysphoria and distorted perceptions. The experiments reported here measured salvinorin A (1–3 mg/kg, i.p.) discriminative stimulus properties in male Sprague–Dawley rats conditioned to recognize the discriminative stimulus cue generated by the well characterized  $\kappa$ -opioid agonist U-69593 (0.56 mg/kg, i.p.). At three distinct active doses, salvinorin A fully substituted for U-69593 without altering response rates. The lever choice pattern in U-69593 trained animals reverted to vehicle lever responding when a kappa selective antagonist compound, nor-BNI (4.5 nM, i.c.v.) was administered 1 h prior to salvinorin A, yet nor-BNI alone failed to impact the rate or pattern of subject responses. These findings confirm and extend results published after similar drug discrimination tests were performed in rhesus monkeys. The discussion section of this article highlights public concern over salvinorin A misuse and emphasizes several potential pharmacotherapeutic applications for salvinorin A or analogue compounds.

**Keywords:** Salvinorin A; *Salvia divinorum*; Kappa opioid; Drug discrimination; Operant conditioning

### 1. Introduction

Salvinorin A is a structurally unique furanolactone neoclerodane diterpene and is the main active drug in *Salvia divinorum*, a ‘Mexican-mint’ sage plant belonging to the Lamiaceae family. Salvinorin A is both pharmacologically and chemically unique in that it represents the first non-nitrogenous, naturally occurring  $\kappa$ -opioid receptor selective agonist and the only known non-alkaloidal hallucinogen (Roth et al., 2002). *Salvia divinorum* has a long history of use for traditional spiritual purposes by Mazatec shamans of Oaxaca, Mexico (Valdés, 1994). More recently, the leaves and extracts of *S. divinorum*

have been misused for hallucinatory and mind-expanding effects (Bucheler et al., 2005). Cultivation and purchase of *Salvia divinorum* first appeared in young people from Mexican cities and has since spread through Europe, showing that global abuse of the drug is increasing. The use or possession of *Salvia divinorum* is not banned by most countries, which draws appeal from drug users. Attraction to the drug among recreational users can be attributed to hallucinogenic effects, which in doses above 200  $\mu$ g rival the synthetic hallucinogen lysergic acid diethylamide (LSD) in doses of 50–250  $\mu$ g (Bucheler et al., 2005). *Salvia* product abusers experience a psychic depersonalization condition, a unique sensation of being disconnected from one’s body.

Currently, few studies with salvinorin A have been performed in vivo. In mice, antinociceptive effects of the drug

\* Corresponding author. Tel.: +1 419 772 2287; fax: +1 419 772 1917.  
E-mail address: [c-willmore@onu.edu](mailto:c-willmore@onu.edu) (C.B. Willmore-Fordham).

were shown using tail-flick and hot plate thermal nociceptive assays (McCurdy et al., 2006). Sedation and motor incoordinating effects of the drug were also shown in mice as disrupting climbing strategies in an inverted screen task (Fantegrossi et al., 2005). A forced swim test (Carlezon et al., 2006) revealed increased immobility accompanied by decreased swimming behaviors in rats, opposite to that seen by SSRIs, suggesting that salvinorin A produces pro-depressant like effects; however, salvinorin A elicits a complex spectrum of effects on mood-related variables. Indeed, clinic data suggest salvinorin A abuse is growing *because* of the complex mindset and mood changes invoked (Bucheler et al., 2005; National Drug Intelligence Center, 2007; Halpern, 2004). When leaves of *Salvia divinorum* are chewed or smoked, exposed individuals describe an intensely positive hallucinogenic experience (e.g., altered depth perception, heightened sensual and aesthetic appreciation, creative dream-like state). At least one case report secures mood-elevating effects from salvinorin A. This case documented a 26-year-old woman, depressed according to HAM-D scores, who remitted the symptoms of her depression with *Salvia divinorum* bought through a mail-order herbalist (Hanes, 2001). In line with the clinic report of a *Salvia* derivative's mood-elevating effects, Braida et al. (2007) showed reinforcing effects in a conditioned place preference test after injecting zebra fish with salvinorin.

Drug discrimination has long proven to be a reliable, robust, and selective model to discover the behavioral effects of various compounds. Drug discrimination is also endorsed as a test to infer neurological underlays and/or receptor mediation pathways for psychoactive drugs. Drug discriminating animals are rewarded for responding appropriately (i.e., correct lever-press sequence) after either a 'training' drug or its vehicle is administered. The discriminative stimulus properties of salvinorin A were studied in rhesus monkeys by Butelman et al. (2004). The Butelman study used a well characterized  $\kappa$ -opioid agonist, U-69593, to train responses under distinguishable stimulus conditions (i.e., training drug versus vehicle sessions). Butelman et al. (2004) reported  $\kappa$ -opioid receptor mediation of salvinorin A's psychotropic effects when subcutaneous injections of salvinorin A cross generalized to U-69593. Our search of the published literature revealed no rodent drug discrimination studies to verify  $\kappa$ -opioid receptor mediation of salvinorin A's effects. To fill this research gap, a group of ten Sprague–Dawley rats were trained to recognize the discriminative stimulus effects of U-69593, and generalization tests followed to discover whether or not rats would respond similarly to the interoceptive cue generated by salvinorin A (1–3 mg/kg, i.p.). In a second series of experiments, a subgroup of the U-69593 discriminating rats received pre-session injections (i.c.v.) with the  $\kappa$ -opioid antagonist nor-BNI, before being injected with salvinorin A, to verify the proposed pharmacologic mode of action. Our expectation, as this experimental series started, was to note salvinorin A substitution for U-69593. While most in vivo and in vitro research data have supported  $\kappa$ -opioid receptor mediation of salvinorin A's central nervous system effects (Chavkin et al., 2004; Fantegrossi et al., 2005; McCurdy et al., 2006; Roth et al., 2002),

pause is taken while interpreting the findings in two non-human primate experiments where an incomplete reversal of salvinorin A effects was reported for monkeys pretreated with a  $\kappa$ -opioid receptor selective antagonist (Butelman et al., 2004, 2007).

## 2. Materials and methods

### 2.1. Subjects

Ten male Sprague–Dawley rats (Harlan Laboratories, Indianapolis, IN), weighing 280–340 g at the beginning of the experiments were subjects for this study. The rats were housed individually in plexiglass cages with free access to water in a temperature controlled room ( $23 \pm 1^\circ\text{C}$ , with humidity  $50 \pm 10\%$ ) scheduled for 12 h light/dark exposure cycles. Subjects for these experiments were drug naive and were maintained in facilities accredited by the Institutional Animal Care and Use Committee at Ohio Northern University. Rats were maintained at  $\sim 80\%$  of their free feeding body weight in order to motivate operant responding for food rewards. Effort was expended to minimize animal suffering over the course of these experiments.

### 2.2. Apparatus

Operant conditioning chambers (Lafayette Instruments) constructed with left- and right-mounted response levers and a central food cup were used. Research Diet<sup>®</sup> (Natick, MA) 45-mg rat pellets rewarded conditioned behaviors. A 15-W white house light above the chamber's transparent ceiling was lit for all sessions. Chambers were set in sound-attenuating wooden cubicles with a fan motor to provide ventilation and mask noise. ABET<sup>™</sup> software controlled the experimental environment. Repeat conditioning induced a pairing of right chamber levers (red cue-light) to drug (U-69593) injection and left chamber levers (amber cue-light) to vehicle injection.

### 2.3. Drugs

U-69593 ((5 $\alpha$ ,7 $\alpha$ ,8 $\beta$ )-(–)-N-methyl-N-[7-(pyrrolidinyl)-1-oxaspiro[4,5]-dec-8-yl]-benzeneacetamide; Sigma-Aldrich, St. Louis, MO) was dissolved in isotonic saline with 10  $\mu\text{l}$  of glacial acetic acid. Salvinorin A (isolated and purified from *Salvia divinorum* in Oxford, Mississippi (McCurdy laboratory)) was first dissolved in dimethylsulfoxide and then dissolved in isotonic saline for injection. Norbinaltorphimine dihydrochloride (nor-BNI) (Sigma-Aldrich, St. Louis, MO) was dissolved in isotonic saline. All drugs except nor-BNI were administered in a volume of 1 ml/kg. Doses were calculated as those of the bases. The doses and pre-injection intervals for U-69593, salvinorin A, and nor-BNI were selected from pilot studies or from previously published reports (McCurdy et al., 2006).

### 2.4. Administration of norbinaltorphimine into the right lateral ventricle

Six rats were anesthetized with a mixture of ketamine plus xylazine (80 mg/kg plus 12 mg/kg, i.p.; Sigma-Aldrich, St. Louis, MO) and given diazepam (10 mg/kg, i.m.). Guide cannulae were then implanted using a Stoelting (model 51400) stereotaxic frame, but coordinate measurements were taken manually with a plastic ruler. The skull was exposed, and a small hole was drilled unilaterally. The cannula was lowered to 1 mm above the target site (coordinates relative to bregma: A, –1.3; L, 1.0; V, 4.0), and, together with two additional screws, was embedded in dental cement.

The tips of the guide cannulae (25 gauge, Plastics One, VA, USA) extended beyond the skull by 1 mm. Microinjection of nor-BNI was done manually, with a Hamilton syringe, in a volume of 3  $\mu\text{l}$ . Intracerebroventricular injection (i.c.v.) doses were instilled over a 60 s period, and followed by a 2  $\mu\text{l}$  of saline flush. The injection cannula was left in place for 60 additional seconds. Although six of the ten U-69593 discriminating animals underwent surgery to implant intracerebroventricular cannulae, a nor-BNI-blocked dose effect curve for

salvinorin A was only determined in five subjects because the i.c.v. cannula dislodged from supportive dental cement in one surgically prepared animal.

## 2.5. Experimental procedure

### 2.5.1. Training with U69,593 as a discriminative stimulus

Training sessions occurred from Monday to Saturday, between 1100 and 1800 h. Early training was arranged on a double alternation schedule—daily sessions exposed all subjects three times per week to U-69593 (0.56 mg/kg) injections and three times per week to saline injections. As the right lever was arbitrarily paired with training drug, consecutive responses at the right lever (FR-10) were reinforced by the delivery of a food pellet on the days designated for U-69593 injection. Responses emitted on the opposite lever (FR-10) produced food pellet rewards on the days designated for saline injection. Injections of U-69593 or saline were given i.p. 10 min before subjects were placed into operant chambers. Responses on the incorrect lever reset the response count on the correct lever. All training sessions ended after 20 min, when animals were returned to home cages and given a sufficient quantity of Purina Laboratory Chow to sustain ~80% of their expected free-fed weight.

Drug-induced stimulus control was assumed to be present when the animals consistently selected the appropriate lever (U-69593 or vehicle) first in three vehicle plus three training-drug consecutive sessions. Our training procedure also stipulates rats must emit 80% of all lever press responses at the correct lever and a minimum of 80 lever presses must be emitted for a training session to be counted. Once this level of performance was achieved, testing with various doses of salvinorin A was initiated.

### 2.5.2. Pilot tests to resolve salvinorin A dose range

The sparse literature describing salvinorin A effects in rats made it difficult to specify an appropriate salvinorin A dosage range for substitution tests. Therefore, pilot tests were conducted to scrutinize salvinorin A effects on spontaneous locomotion and to detect dose-dependent influences on treated subjects' responsiveness to stimuli. The pilot test series consisted of six open-field observing sessions, 30 min in duration, to assess salvinorin A influences in a separate group of naive female rats with no operant conditioning history. Pilot test rats were watched in an open field environment—an exploratory environment wherein experimenters introduced cues to elicit a variety of spontaneous reactive behaviors (e.g., righting reflex, response to pencil-pokes, reaction to food stimuli). Six discrete doses of salvinorin A were assessed during pilot tests: (i) 0.1 mg/kg, (ii) 0.3 mg/kg, (iii) 1.0 mg/kg, (iv) 3.0 mg/kg, (v) 5.6 mg/kg, (vii) 10 mg/kg. Data from pilot tests suggested 0.1 mg/kg and 0.3 mg/kg as “no-effect” doses, and all doses above the 1.0 mg/kg dose produced motor incoordination during the last 15 min of observation plus dose-dependent catalepsy at times proximal to i.p. drug administration. The 5.6 mg/kg and 10 mg/kg doses also produced salivation/drooling and forelimb tremor. After completing the pilot tests and consulting the relevant literature, the 1.0–3.0 mg/kg range was considered optimal to reflect salvinorin A discriminative stimulus effects.

### 2.5.3. Discrimination tests with salvinorin A

When a rat met testing criteria for consistent U-69593 discrimination performance, test sessions were planned to present salvinorin A doses in an irregular order. Ultimately, all subjects received the range of salvinorin A doses (1.0 mg/kg, 1.9 mg/kg, and 3.0 mg/kg), but the order of dose presentations varied among subjects. Test sessions were identical to training sessions with the exception that 10 consecutive responses on either lever produced food delivery. When salvinorin A substitution tests commenced, a single alternation schedule between training drug, saline vehicle, and salvinorin A was followed. Rats were considered eligible for substitution testing only after completing two prior training sessions (U-69593 plus vehicle) at an accuracy level of at least 80% and after emitting their first response (FR10) at the correct lever. If the accuracy of trained animals deteriorated relative to stated criteria, further training sessions were given before testing was reinstated.

### 2.5.4. Discrimination tests with nor-BNI pretreatment

Following the discrimination tests with salvinorin A, similar tests were done with a pretreatment of the  $\kappa$ -opioid antagonist nor-BNI. Rats were given

nor-BNI (10 mg/ml solution, 3  $\mu$ l, i.c.v.) 60 min before the administration of salvinorin A. The discrimination tests then preceded as described above. To demonstrate stimulus control from the same training dose of U-69593, probe tests (2 min at the start of each training session) were performed with U-69593 or saline. In order to rule out the possibility that behavioral changes were due to nor-BNI during sessions of  $\kappa$ -opioid antagonist and salvinorin A co-administration, extra control sessions were scheduled for each test animal. Thus, a preliminary control session measured nor-BNI (10 mg/ml solution, 3  $\mu$ l, i.c.v.) against nor-BNI's vehicle (saline, i.c.v.). After noting that nor-BNI failed to alter behavior relative to its vehicle, a second i.p. saline control session was scheduled. Data from the i.p. saline control session was statistically analyzed against data collected in sessions of nor-BNI and salvinorin A co-administration.

## 2.6. Data analysis

Data from salvinorin A test sessions were analyzed for similarity to U-69593 by determining the mean percentage of responses on the U-69593-associated lever. An a priori decision was made to deem 80% or more U-69593-lever responding, during salvinorin A test sessions, as full generalization. In addition to monitoring U-69593 appropriate responding, the total number of lever presses in each session was recorded and response rates were tabulated to reflect non-specific effects on behavior. The response rate data were graphed after conversion to a percentage of the average saline session response rate (mean in 5 saline injection sessions). Finally, reinforcement pellets earned in each 20 min testing session was recorded and caloric equivalent tabulated to adjust post-session feedings.

The data of primary interest are the proportion of responses made on the drug-state appropriate lever during salvinorin A test sessions. Because the drug-lever selection data is difficult to interpret when the subject is severely impaired, data from sessions in which responding was less than 0.06 responses/min were excluded from determination of the mean percentage of U-69593-lever responding. Data from sessions exceeding the 0.06 responses/min threshold were used in a General Linear Model (GLM) analysis to distinguish any significant effects related to salvinorin A dose. This GLM statistical analysis was applied for salvinorin A testing sessions both with and without prior nor-BNI injection. The variance of GLM mean measures was further examined in Dunnett's *t* posteriori comparison tests where appropriate. Calculations were performed using SPSS, version 10 software. A similar GLM analysis was undertaken to discover whether or not salvinorin A significantly affected rats' responding rates.

## 3. Results

Drug discriminative stimulus control was shown unequivocally for U-69593, and the mean number of training periods to establish discrimination was 85 ( $\pm$ 3) sessions. At all three active doses, salvinorin A displayed a rapid onset of action (i.e., 10 min for visible effects). Results from substitution tests with salvinorin A are shown in Fig. 1. Salvinorin A fully substituted for the U-69593 interoceptive cue. Salvinorin A, administered at either the 1 mg/kg or 3 mg/kg dosage resulted in 96% subject responding at the drug appropriate lever, while the middle dose of salvinorin A, 1.9 mg/kg, yielded 88% drug appropriate responding in U-69593-trained rats. A GLM statistical analysis confirmed cross generalization of salvinorin A to U-69593 [ $F(3,18) = 8.37$ ,  $p < 0.01$ ], and post hoc tests proved all salvinorin A doses were statistically different from vehicle ( $p < 0.05$ ).

The effects of salvinorin A on response rates are shown in Fig. 2. While specific doses of salvinorin A had influence over bar press rates, no statistically significant change in rats' responding rates was revealed [ $F(3,18) = 0.23$ ,  $p > 0.98$ ].

Fig. 1. Stimulus generalization (% DBR) following three doses of salvinorin A (1.0–3.0 mg/kg, i.p.) in male rats ( $n = 10$ ) trained to discriminate U-69593 (0.56 mg/kg, i.p.) from saline. Lever selection data are plotted as group mean; error bars show standard error of the mean. Data points above Veh and TD represent the results of control tests with saline and training drug (U-69593). Significant differences from vehicle session choice patterns are designated by an asterisk.

Visual inspection of graphed means for rats' percent control response rate shows salvinorin A provoked a slight decrease in the rate of bar pressing at the 1 mg/kg and the 3 mg/kg dose levels, but no rate change was apparent in sessions testing the middle dose (1.9 mg/kg).

The discriminative effects of salvinorin A were blocked by nor-BNI (4.5 nM, i.c.v.) in all subjects. In support of this, pre-session injections of nor-BNI completely reverted the lever selections of rats that later received salvinorin A (1 mg/kg, 1.9 mg/kg, 3 mg/kg, i.p.). As shown in the upper panel of Fig. 3, during the sessions of nor-BNI and salvinorin A co-

Fig. 2. Mean response rates, expressed as a percentage of vehicle control response rates (% CRR) in male rats ( $n = 10$ ) trained to discriminate U-69593 (0.56 mg/kg, i.p.) from saline during salvinorin A substitution tests. The total number of responses emitted on both levers during salvinorin A test sessions was divided by the session duration (1200 s) for each rat, and data from individual rats were averaged for each test condition. Data points above Veh and TD represent the results of control tests with saline and training drug (U-69593; 1.0 mg/kg). Data points show group mean; error bars show standard error of the mean.

Fig. 3. Upper panel: the left series of bars plots antagonism of the discriminative stimulus effects of salvinorin A (1.0–3.0 mg/kg, i.p.; expressed as % DBR), and salvinorin A vehicle, during nor-BNI (4.5 nM, i.c.v.) co-administration sessions. The right side plots % DBR data during sessions without nor-BNI pre-administration. Salvinorin A cross generalization tests used male rats trained to discriminate U-69593 (0.56 mg/kg, i.p.) from saline. Lever selection data are plotted as group mean; error bars show standard error of the mean. Lower panel: the left series of bars shows response rates tabulated during salvinorin A generalization tests (1.0–3.0 mg/kg, i.p.; expressed as % CRR) and indicates a salvinorin A vehicle session rate, while nor-BNI (10 mg/kg, i.c.v.) co-administration was stipulated. The right side plots % CRR data during sessions without nor-BNI pre-administration. Salvinorin A cross generalization tests used male rats trained to discriminate U-69593 (0.56 mg/kg, i.p.) from saline. % CRR is plotted to show group mean; error bars show standard error of the mean.

administration, subjects overwhelmingly emitted vehicle lever responses. However, data collected while concomitantly dosing antagonist and agonist do not indicate differences in bar press rates (Fig. 3, lower panel). In other words, pre-treatment with the  $\kappa$ -opioid selective antagonist compound revoked drug appropriate responding but had no impact on the rate of lever pressing.

#### 4. Discussion

The present study targets a broader general awareness of the sage plant-derived hallucinogen, salvinorin A. The illicit use of easy access hallucinogenic compounds, like salvinorin A, is a reemerging health problem, particularly among well-educated young adults and teenagers (Hunt, 1997; Schuster et al., 1998). Salvinorin A is misused because intake of this

herb, by smoking or leaf-chewing, produces a short-lived inebriant state with intense, bizarre feelings of depersonalization (Halpern and Pope, 2001). Readers may view it odd that any 'out-of-body' or depersonalized state would be desired; on the other hand, the cohort groups sanctioning use of this drug defend it vigorously. Supporters of recreational *Salvia divinorum* use claim, while certain elements in the drug trip may cause discomfort, bad trip experiences are likely to be trumped by positive experiences (Giroud et al., 2000; Sheffler and Roth, 2003). Since *Salvia divinorum* extracts are hallucinogenic and act principally through opioid receptors, experts in this field of study view *Salvia* products as 'narcotic'.

Behavior analysts define a narcotic 'cue' as, "the discriminative stimulus complex which is exclusively associated with the specific central actions of a narcotic drug" (Colpaert et al., 1975). Results from the present study show salvinorin A produces a discriminative stimulus complex in rats similar to that of the  $\kappa$ -opioid agonist U-69593. This finding, together with salvinorin A's high and selective affinity at  $\kappa$ -opioid receptors in vitro (Roth et al., 2002) and replicate demonstrations of salvinorin A's  $\kappa$ -opioid like signal transduction cascade (Vortherms et al., 2007; Wang et al., 2005) support  $\kappa$ -opioid receptor mediation of the subjective effects of salvinorin A. In this experimental series, we showed salvinorin A induction of drug appropriate lever selections in U-69593 trained rats, but lever selections reverted to the vehicle designated lever when the kappa selective antagonist compound nor-BNI was administered by intracerebroventricular injection. The possibility that non-specific effects of nor-BNI were responsible for its surmounting salvinorin A substitution for U-69593 can be ruled out, since nor-BNI alone provoked responses at the vehicle designated lever. The antagonist reversal of conditioned responses reported here is consistent with results published by Zhang et al. (2005), showing nor-BNI blockade of salvinorin A-induced place aversion and a decrease in dopamine levels in the nucleus accumbens. Likewise, reversal of conditioned responses in this experimental series falls in line with a report describing zebra fish swim pattern changes after intramuscular injection of salvinorin A in a conditioned place preference test when paired with nor-BNI (Braidia et al., 2007). More data to bolster the scientific claim that salvinorin A's effects are  $\kappa$  opioid receptor mediated were published from a series of experiments that used  $\kappa$  opioid receptor knockout mice as subjects. Ansonoff et al. (2006) showed  $\kappa$  opioid receptor knockout mice do not respond to salvinorin A when analgesia and temperature are used as readouts. On the other hand, a partial (~66%) block of salvinorin A substitution for U-69593 in drug discriminating monkeys was reported by Butelman et al. (2004). A different antagonist was used in the Butelman study, namely GNTI. GNTI resembles nor-BNI pharmacologically by virtue of its  $\kappa$ -opioid selectivity (Jones and Portoghese, 2000). However, Butelman and colleagues injected GNTI peripherally before measuring cross generalization between salvinorin A and U-69593. Even while granting GNTI likeness to nor-BNI, differences in the species used and routes of administration distinguish our experiments from the discrimination tests in Butelman et al. (2004), which rationalizes an outcome disparity.

Salvinorin A did not systematically decrement rats' response rates as dose increased. Visual inspection of the graphed response rate data (Fig. 2) shows an inverted U shaped dose effect curve. Our search of the drug discrimination literature revealed precedence for this type of response rate curve, exemplified when the  $\kappa$ -opioid agonist probes E-2078 and R-84760 were administered to ascertain cross substitution in U 50488-trained and TRK-820-trained animals, respectively (Mori et al., 2004). Another aspect of the salvinorin A precipitated changes to bar press rates warrants mention because, in the pilot segment of our investigations, non-specific motor impairment (e.g., motor incoordination, motor depression, catalepsy) was specified for naïve rats that received salvinorin A injections in the 3–10 mg/kg dosing range. Since a systematic response rate decrement was not concluded during salvinorin A drug discriminating sessions, the possibility remains open that discordant motor effects, in discriminating relative to naïve rats, are reflecting cross-tolerance (Colpaert, 1978). If acceptance is granted for this interpretation, then the analyst asserts that animals receiving daily doses of U-69593 may manifest tolerance to the motor sedative effects of many  $\kappa$ -opioid receptor agonists. Further, tolerance to the motor effects of *Salvia* products seem to manifest in dosing ranges lower than that required for tolerance to narcotic cuing. Finally, the slow and uncoordinated motor performance we detected after administering 3–10 mg/kg salvinorin A to naïve animals is consistent with the test outcomes reported for salvinorin A when mice were examined (Fantegrossi et al., 2005; Zhang et al., 2005).

Together, these data provide empirical verification that the salvinorin A discriminative stimulus cue is  $\kappa$ -opioid receptor mediated in rats. These findings corroborate conclusions about the central origin of salvinorin A's narcotic cue in monkeys (Butelman et al., 2004). An important question arises when  $\kappa$ -opioid receptor mediation of salvinorin A effects is contemplated: how can research teams, focused on medicinal product development, harness a therapeutic effect from *Salvia* plant extracts or related synthetic analogues? It is instructive to recall the ubiquity of  $\kappa$ -opioid receptor expression in central and peripheral neural circuits (Barry and Zuo, 2005). Moreover, recent data critically implicate distinct  $\kappa$ -opioid receptor isotypes (e.g.,  $\kappa_1$ ,  $\kappa_2$ ,  $\kappa_3$  opioid receptors) in pain signaling (McCurdy et al., 2006; Przewlocki et al., 1983), food intake (Morley and Levine, 1983), mood (Carlezon et al., 2006; Pfeiffer et al., 1986) and drug seeking behaviors (Glick et al., 1995; Kuzmin et al., 1997; Schenk et al., 1999; Walsh et al., 2001). Therefore, a proliferation of interest in *Salvia divinorum* should soon emerge to identify  $\kappa$ -opioid agonist and/or antagonist compounds as antinociceptive, antidepressant, and addiction therapies.

pls review carefully- I see that we may need to talk to HPFB again as they still have that content in there

about being an NHP under certain conditions of use, which goes against the legal opinion from Simon Carvalho.....

Hi Cheryl and Jocelyn,

HPFB has finally sent the salvia media lines back with their additions. Could you look at it and make sure you're OK with them? Then, I'll get Andrew's approval again.

Hi Stephanie,

Here are the lines, revised with input from HPFB program areas. Sorry it has taken so long. Lots of

competing priorities these days, and one of my program areas in particular was being difficult. I have noted a concern about the answer in the first Q&A for your consideration.

Do you want to run these by your program areas for a look at the changes before we send them for DG approval?

Subject Re: Fw: Media Lines for Salvia Divinorum

What you say makes a lot of sense. Since they are mainly HPFB issues, could you and your clients take a stab and updating/adding to the lines before we get legal approval? I hadn't realized so many changes were still necessary.

Thanks,

Stephanie Mitchell

Subject Re: Fw: Media Lines for Salvia Divinorum

Hi Stephanie

I have no problem sharing it with Legal now, but I think from a communications point of view there are also things I would change about the lines. The language is very bureaucratic. We don't address the adverse reaction reports we've got on file (reporters always ask), or why we've never acted on the the MHPD report that recommended the substance be scheduled under the CDSA (which media keeps bringing up). We don't really explain how it is that we would regulate a product made from salvia, but not salvia itself. I hope we'll be able to address some of these issues in the approvals process as well before it goes to DGs.

Cheers,  
Darrin

Hi Stephanie,

Chantal Trépanier will review the media lines. The Controlled Drugs and Substances legal team is made up of four lawyers: Chantal Trépanier, Caroline Mercier, Mélanie Poirier and Christine Evans. FYI, Jason Brannen does litigation related work, and we call on his help (or Mary Ormerod's) when a matter is being litigated, which is not the case here.

As head of the team you can always contact me.

Cheers,  
Diane

Subject Media Lines for Salvia Divinorum

Hi Stephanie,

Further to inter-branch meetings between HPFB (NHPD, MHPD, HPFBI) and HECSB (DSCSD) in September, 2007, which were held to discuss *Salvia divinorum* and reach a consensus on next steps, and recent discussions concerning Salvia among the Director Generals of the above

mentioned Directorates in September 2008, DSCSD is working to finalize the latest version of the media lines on *Salvia divinorum* . These lines have been distributed to the HPFB Directorates for comment at the working level and have been approved by:

Andrew Adams, Director, Office of Controlled Substances, DSCSD, and  
Suzanne Desjardins, Director, Office of Research and Surveillance, DSCSD

Please find attached, a copy of the media lines for *Salvia divinorum* for your coordination of senior management approvals with HPFB communications.

DRAFT – HPFB Communications Comments  
February 3, 2009

**Media Lines**  
**Regulatory Control of Salvia Divinorum**

Issue

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Key Messages:

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media has reported that the use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

**Comment:** This bullet was moved to supplementary messages.

**Deleted:** <#>In Canada, neither the herb, *Salvia divinorum*, nor its main active ingredient, Salvinorin A, is controlled under the *Controlled Drugs and Substances Act* (CDSA). ¶

**Deleted:** <#>Health Canada has not approved any *Salvia divinorum* products for sale in Canada. ¶

**Deleted:** is, therefore, not required

Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- In Canada, *Salvia divinorum* under some conditions of use meets the definition of a natural health product under the *Natural Health Product Regulations*. This means that a product making health claims that contains *Salvia divinorum* must be approved by Health Canada prior to being sold in Canada. Products that don't comply with the regulations may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not approved any *Salvia divinorum* products for sale in Canada.

**If asked for specifics on when the survey data will be available:**

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 - There are very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans, and using these studies to predict its potential for addiction and abuse is difficult. The mechanism of action by which *Salvia divinorum* works is still not fully understood from the existing information, and more controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 - How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

- Deleted: Human studies that demonstrate reliable, systematic and
- Deleted: observations
- Deleted: n
- Deleted: are sparse
- Deleted: The information currently available to Health Canada indicates that the likelihood of abuse/misuse of *Salvia divinorum* is unknown, that t
- Deleted: that
- Formatted: Font: Italic
- Formatted: Font: Italic
- Formatted: Font: Italic
- Formatted: Font: Italic
- Deleted: 2

A3 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

Deleted: carefully

- International requirements and trends in control and scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Addiction liability and potential for abuse/misuse of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally;
- and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

Deleted: or not

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – Health Canada maintains an active file on this topic. Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

**Q5 – Has Health Canada received any reports of adverse reactions related to the use of *Salvia divinorum*?**

A5 -- Since 2005, Health Canada has received four reports of adverse reactions associated with the use of *Salvia divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required).

Where did these reports come from?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

Deleted: , which

Deleted: , are short-acting in nature

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were 3 times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely touted on the Internet as a "legal" alternative to street drugs.

The mechanism of action by which *Salvia divinorum* works is not fully understood. While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience is quite unique.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

**Comment:** CT - ✓ Agree, however, this line is included under A4 as well. Suggest removing from A3.

**Deleted:** or not

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – Health Canada maintains an active file on this topic. Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available, in order to determine whether the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum*'s use and controlling its availability.

**Comment:** CT - This line is under A3 as well suggest removing from A3.

**Comment:** CT - ✗ Disagree. Counterintuitive to emphasize importance of ADR's when HRA states "it is important to note that accumulated case reports cannot be used to determine the incidence of a reaction, nor the risk associated with the use of a product, because of the unknown number of individuals exposed to the product and because of the significant under-reporting of ADR's. The CADRMP is not an appropriate tool to obtain information concerning adverse reactions associated with the use of *Salvia divinorum* as a street drug." and non-serious nature of 3 of the events and concomitant use of alcohol and ADD in 4<sup>th</sup> case.

**Q5 – Has Health Canada received any reports of adverse reactions related to the use of *Salvia divinorum*?**

A5 -- Since 2005, Health Canada has received four reports of adverse reactions associated with the use of *Salvia divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required).

Where did these reports come from?

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

**Comment:** CT - ✓ Agree.

**Deleted:** , which

**Comment:** CT - ✓ Agree,

**Deleted:** , are short-acting in nature

**Formatted:** English (U.K.)

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were 3 times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely touted on the Internet as a "legal" alternative to street drugs.

The mechanism of action by which *Salvia divinorum* works is not fully understood. While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience is quite unique.

**Comment:** CT - This line appears under background as well and Brittany has suggested that we remove this line after reading the Willmore et al. article. "It was in this context that I felt there was some play...because people have very different experiences on the drug which have led to the idea that there might be more than just KOR at play....or salvinorin...but yes, just take it out" - Brittany

Hi Valerie,

Just wondering if you've had an opportunity to review the It's Your Health Article on *Salvia divinorum*? I don't think that Sue Lumsden gave us a particular deadline, but we're hoping to have our comments to her mid-week next week.

Thanks,

Subject It's Your Health - Salvia divinorum - Draft One

Good afternoon,

With apologies for the delay since we spoke about this issue, I'm forwarding a first draft of the It's Your Health (IYH) article on Salvia Divinorum.

When reviewing this document, please keep in mind that IYH is geared towards an audience with grade 10-12 literacy skills. We try to use plain language and a conversational tone. I realize this draft is quite simplistic in content, especially when compared to Brittany's research paper.

The usual process with IYH is for the draft to go back and forth between the writer and the Program contacts until you are satisfied with the content and tone of the article, at which point it is forwarded to the IYH Manager (Lisa Mackay) to begin the formal approvals process.

I'll be happy to work with you on revisions via e-mail or telephone, whichever you prefer.

Thank you. I look forward to seeing or hearing your comments on this first draft.

Sue

**s.19(1)**

  - IYH - Salvia Divinorum - Draft One.wpd

Valerie Hurry - Comments

## **Salvia Divinorum**

### **The Issue**

Certain Web sites are promoting the use of *Salvia divinorum* as a “legal” alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make tea to treat such conditions as headache or stomach upset, or to produce “mystical” or hallucinogenic experiences.

Products that claim to contain *Salvia divinorum* – or its main active ingredient, Salvinorin A – are widely available on the Internet and are sold in various “head shops” and corner stores. These products are sold in a number of formats, including seeds; and plant cuttings for propagation purposes. Fresh or dried leaves and liquid extracts; are intended to be either chewed, swallowed or smoked; liquid preparations are also available for consumption. Street names for *Salvia divinorum* include: diviner’s sage, Magic mint, Maria pastra, puff encens special, ska pastora, ska Maria pastora, Sally D, Lady Sally and Salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *Salvia divinorum* to get “high,” but so far, there has been no solid research in Canada on actual use.

Health Canada has not approved any ~~Salvia~~ *Salvia divinorum* products for sale in Canada.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. ~~A number of individual states have done this as well, but~~ *Salvia divinorum* It is not regulated under the *Controlled Substances Act* in the United States but a number of individual states have placed restrictions on its sale.

### **Risks associated with using *Salvia Divinorum***

The use of *Salvia divinorum* distorts reality. The effects vary from person to person, are often described as unpleasant, and may include the following:

- hallucinations (“seeing” objects that are not there);

## Valerie Hurry - Comments

- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one experience to the next, depending on such factors as the potency of the product, how much was used, whether it was ingested or smoked, and the user's mood and expectations. It does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

A major concern about *Salvia divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following issues:

- whether it is toxic;
- precisely how it acts on the brain;
- how long it acts on the brain and whether there are permanent effects;
- whether it causes physical or psychological dependence (unlikely according to the evidence available so far);
- how it interacts with other substances (including drugs and alcohol).

Also, since no *Salvia divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware."

## The Legal Status of *Salvia divinorum*

From time to time, Health Canada is asked why *Salvia divinorum* and Salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits);
- the potential for addiction and abuse/misuse of the substance;
- the extent of actual abuse and misuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage risks. ~~To date, no law enforcement agencies have advised Health Canada that the use of *Salvia divinorum* poses any particular threat to public~~

## Valerie Hurry - Comments

~~safety. However, as noted earlier, very little is known about the potential for addiction or the extent of actual use.~~

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

### Minimizing Your Risk

Health Canada recommends that you avoid using *Salvia divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

reversed order of NPN and DIN-HM

These numbers indicate that the product's quality, safety and efficacy, including labelling and instructions for use, have been reviewed. As stated earlier, no *Salvia divinorum* products have been approved by Health Canada.

### Health Canada's Role

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum* and to control the availability of this substance.

### Need More Info?

For information about Health Canada's Drug Strategy and Controlled Substances Programme, go to: <http://www.hc-sc.gc.ca/ahc-asc/branch-dirgen/hecs-dgsesc/dscsp-psasc/index-eng.php>

Subject It's Your Health - Salvia divinorum - Draft One

Good afternoon,

# Salvia Divinorum

## The Issue

Certain Web sites are promoting the use of *Salvia divinorum* (*S. divinorum*) as a "legal" alternative to street drugs. Health Canada recommends that you avoid using this substance because very little is known about the extent of adverse effects, and there is no way to predict how it will affect you.

## Background

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, these are effects on the mind.

The leaves of this plant are used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to produce a "mystical" or hallucinogenic experiences.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops". These products are sold in a number of formats, including seeds, plant cuttings for propagation purposes. Fresh or dried leaves are intended to be either chewed, swallowed or smoked; liquid preparations are also available for consumption. Street names for *S. divinorum* include: diviner's sage, magic mint, maria pastra, puff encens special, ska pastora, ska maria pastora, sally D, lady sally and salvia.

Recently, there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* specifically for its ability to produce hallucinations (i.e. "seeing" objects that are not there), but so far, there has been no solid research in Canada on its actual use.

Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not be available until 2010. (2008 Canadian Alcohol and Drug Use Monitoring Survey too?)

Health Canada has not approved any *Salvia divinorum* products for sale in Canada. In Canada, neither *S. divinorum* nor salvinorin A are controlled, under the *Controlled Drugs and Substances Act*. *Salvia divinorum* does meet the definition of a natural health product under the *Natural Health Product Regulations*, which means that a product that contains *Salvia divinorum* must be approved by Health Canada prior to being sold in Canada. Health Canada has, however, not approved any Salvia products for sale in Canada.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. A number of individual

**The Legal Status of *Salvia Divinorum***

From time to time, Health Canada is asked why *S. divinorum* and salvinorin A are not prohibited under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers many factors, including the following:

Deleted: In cases like th [26]

Deleted: alvia... S [27]

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not be available until 2010.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a product is "natural," this does not mean it is safe. Natural Health Products that have been approved by Health Canada will have one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that the products have undergone and passed a review of their formulation, labelling and instructions for use. As stated earlier, no *S. divinorum* products have been approved by Health Canada.

### Health Canada's Role

Health Canada continues to collect and consider information regarding *Salvia divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum* and to control the availability of this substance.

### Need More Info?

For information about Health Canada's Drug Strategy and Controlled Substances Directorate, go to: <http://www.hc-sc.gc.ca/ahc-asc/branch-dirgen/hecs-dgsesc/dscsp-psasc/index-eng.php>

Also, see the section on Prevention on the Government of Canada's National Anti-Drug Strategy Web site at: <http://www.nationalantidrugstrategy.gc.ca/>. This site has a number of helpful

DRAFT  
February 24, 2009

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media has reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### **Supplementary Messages:**

#### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- *Salvia divinorum* does however meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Number's (NPN) or Drug Identification Number's (DIN) - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

no apostrophes

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

## **Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. The mechanism of action by which *Salvia divinorum* works is still not fully understood from the existing information, and more research is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A3 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;

- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- ~~Addiction liability and potential for abuse/misuse~~ <sup>Abuse</sup> of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with *Salvia divinorum* ~~use~~.

Health Canada will however continue to collect and consider information regarding <sup>the use of</sup> *Salvia divinorum* as it becomes available.

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – See A3

**Q5 – Has Health Canada received any reports of adverse reactions related to the use of *Salvia divinorum*?**

A5 – Since 2005, Health Canada has received four reports of adverse reactions associated with the use of *Salvia divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required).

Delete Q5&A5 OR...

~~① Health Canada has received reports related to~~  
 A5 - ~~Four adverse reactions associated with the use of *Salvia divinorum* as a hallucinogen have been reported to Health Canada through the Canadian Adverse Drug Reaction Monitoring Program (CADRMP). Three of these reports were considered non-serious (requiring no medical attention) and the fourth was considered serious (medical intervention was required). The CADRMP was, however, designed to receive reports concerning adverse drug reactions to marketed health products that have been reviewed and approved for sale in Canada, and not for adverse reactions associated with the use of *Salvia divinorum* as a street drug. As a result, some concerns regarding the significance of this information have been raised as it cannot be used to determine the incidence of a reaction, nor the risk associated with the use of *Salvia divinorum*, because of the unknown number of individuals exposed to this product and the significant under-reporting of adverse reactions.~~

~~② The number of reports and even the types of reactions, <sup>Health Canada does not have any information</sup> ~~reported e.g., XXX, not~~ is not significant however given that CADRMP is~~

I prefer my revised question what is the significance of ...  
 A: of which *Salvia* is not ...

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were 3 times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely touted on the Internet as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Do you feel comfortable taking this one on? I think you should feel free to tell him that he is always welcome to keep us informed via the PRAD account.....and that we are always interested in reports of abuse/misuse/inappropriate sale etc. Specific info about retailers is also of interest.

In terms of regulating, I think you should be honest and say that at the moment, we have not yet made a decision as to whether prohibition under the CDSA is appropriate.....

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media has reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### **Supplementary Messages:**

#### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- *Salvia divinorum* does however meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A3 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;

- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Abuse liability and addiction potential of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*.

Health Canada will however continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – See A3

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through its Canadian Adverse Drug Reaction Monitoring Program (CADRMP). However, the number of reports and even the type of reactions reported (e.g. non serious – requiring no medical intervention or serious – medical intervention was required) is not significant given that the CADRMP is designed to receive adverse drug reaction reports related to health products that have been reviewed and approved for sale in Canada of which *Salvia divinorum* is not. [Health Canada ~~also~~ does not have any information about the number of individuals using or who have used *Salvia divinorum*.]

In this regard, and because [ ], these adverse ~~drug~~ reaction reports cannot be deemed to be significant.

As a result, some concerns regarding the significance of this information have been raised as it cannot be used to determine the incidence of a reaction, nor the risk associated with the use of *Salvia divinorum*, because of the unknown number of individuals exposed to this product and the significant under-reporting of adverse reactions.

### Background

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data

from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were 3 times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely touted on the Internet as a “legal” alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Subject Phone Enquiry - Salvia w/phone number

Cheryl,

Not that I'm aware of. Last week, I asked her and she said she would try, but I doubt she did because she was swamped and did not get back to him. He called back and was expecting a call last week.

Please let me and Jennifer know when you have contacted him.

Thanks,  
Carmen

Hi Carmen,

I just got back into the office today.

Do you know whether or not Jocelyn had a chance to call Const. Caruso back last week? If not, I will call him today. I had tried him on Friday, February 27th with no luck.

Thanks,

Cheryl Tremblay

Constable Caruso can be reached today before 10:15 or from 4:00 PM on or tomorrow and Friday. He can be reached at 450-536-3334 x 232.

Please let me and Jennifer know once you have responded for our tracking purposes.

Thank you,  
Carmen

## PRAD Telephone Enquiry

Date of Call: Tuesday, March 10, 2009  
Subject: *Salvia Divinorum*  
Language of Correspondence: English/French

Caller Name: Constable Richard Caruso  
Caller Origin: Québec  
Caller Telephone Number: 450-536-3334 x 232  
Caller Email Address: rcaruso@police-rsl.qc.ca

### CALL SUMMARY:

I spoke to Constable Richard Caruso of the Richelieu Saint-Laurent Regional Police Service today. Constable Caruso had called to notify the Office of Controlled Substances (OCS) that he is receiving a lot of complaints from citizens indicating that *Salvia divinorum* is readily available, advertised in some stores, and sold to school-aged kids in his community. Const. Caruso had been told that Health Canada is working on regulating this substance and wanted to know whether he should report these complaints to OCS.

I confirmed with Const. Caruso that Health Canada is collecting relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed. I informed Const. Caruso that he is more than welcome to forward any information he has with respect to *Salvia divinorum* via [ocs\\_policy\\_and\\_regulatory\\_affairs@hc-sc.gc.ca](mailto:ocs_policy_and_regulatory_affairs@hc-sc.gc.ca) or fax at (613) 946-4224.

Upon the recommendation of Michelle Gillespie at the Health Products and Food Branch Inspectorate, I also sent Const. Caruso a follow-up email with contact information for Francine Menard, Supervisor of the Operational Centre for the Québec Region.

I told him to please not hesitate to contact us should he have any further questions.

Cheryl Tremblay  
Policy Analyst

DRAFT  
March 10, 2009

### Media Lines Regulatory Control of Salvia Divinorum

**Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* and media sources suggesting that *Salvia divinorum* is specifically for its hallucinogenic properties.

Cheryl

**Key Messages**

- ① Date of this version? (if includes MHPD changes)
- ② one small change Pg 3
- ③ Good job - so what next -> four ADM via Commes?
- ④ Where are we at with our IAS?

**Supplementary**

J/K

**On the**

- Is *Salvia divinorum* a psychoactive ingredient, as defined in the *Controlled Substances Act*?
- Is *Salvia divinorum* a controlled substance under the *Control Conventions* and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

DRAFT  
March 10, 2009

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media has reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### **Supplementary Messages:**

#### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- *Salvia divinorum* does, however, meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A3 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;

- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Abuse liability and addiction potential of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*.

Health Canada will, however, continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q4 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A4 – See A3

**Q5 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A5 – Health Canada has received four adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through its Canadian Adverse Drug Reaction Monitoring Program (CADRMP). However, the number of reports and even the type of reactions reported (e.g., non serious – requiring no medical intervention or serious – medical intervention was required) is not significant given that the CADRMP is designed to receive adverse drug reaction reports related to health products that have been reviewed and approved for sale in Canada of which *Salvia divinorum* is not. In this regard, and because Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*, these adverse reaction reports cannot be deemed to be significant.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.

have

- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely touted on the Internet as a “legal” alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Subject Heads Up: Salvia Divinorum

Good Afternoon Francine,

The Office of Controlled Substances recently received a phone call from a Constable Richard Caruso of the Richelieu Saint-Laurent Regional Police Service, to notify us that he is receiving a number of complaints from citizens indicating that *Salvia divinorum* is readily available, advertised in some stores, and sold to school-age children in his community, Beloeil, QC. Constable Caruso would like to know whether there is anything that can be done about this situation.

I just spoke with Michelle Gillespie at the Inspectorate and she suggested providing Constable Caruso with your contact information as this request should be handled at the regional level.

Thanks,

Subject Re: It's Your Health - Salvia divinorum - Draft One

Hi Jocelyn,

I spoke to Sue this am regarding our comments on the IYH for Salvia and she is in agreement with the majority of our suggestions, but would like us to consider the following:

(1) We had suggested removing the following paragraph from the Risks section as it was deemed too complicated for this document. We do address the fact that NHPs that have been approved by HC are labelled as (...) and have undergone a rigorous review, however, Sue still thinks that it is important that we capture the "buyer-beware" notion.

Also, since no *S. divinorum* products have been approved for sale in Canada, products that claim to contain this substance have not been reviewed by Health Canada. As such, they may be counterfeit or may contain other ingredients that pose risks to health. In cases like this, it is always a matter of "buyer beware".

(2) We had suggesting moving the following paragraph from the Legal Status section to the HC's Role section. Sue has suggested that we either (1) re-consider the move as the paragraphs before this one speak to the scheduling factors and the fact that we don't have enough information to determine whether scheduling is the best option, and thus beg the question, "well then what is being done to get more information." and flows nicely, OR (2) move to HC's Role section and elaborate on what exactly HC's Role is with respect to these surveys (i.e. funding, etc.) or how HC is going to use the information obtained from these surveys.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

(3) We inserted the following sentence under the Risks section, however, the term psychoactive drugs has not been described elsewhere in the document and Sue has suggested that either (1) change the term to hallucinogens, which has been described previously in the document, or (2) provide some examples of psychoactive drugs (i.e. LSD and PCP perhaps)

*S. divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

Sue also wanted to let us know that her contract expires on March 31st and the RFP for the competition to refill the contract has not gone out yet. So....if we want to ensure that there is not a hiatus on the publication of this article she suggested that we request a rush to Lisa MacKay.

I have attached the comments that we had sent to Sue below for your reference.

Hi Jocelyn,

I spoke to Sue this am regarding our comments on the IYH for Salvia and she is in agreement with the majority of our suggestions, but would like us to consider the following:

(1) We had suggested removing the following paragraph from the Risks section as it was deemed too complicated for this document. We do address the fact that NHPs that have been approved by HC are labelled as (...) and have undergone a rigorous review, however, Sue still thinks that it is important that we capture the "buyer-beware" notion.

Also, <sup>as</sup> ~~since~~ no *S. divinorum* products have been approved for sale in Canada, products that ~~claim~~ contain this substance have not been reviewed ~~by Health Canada~~. As such, they may be ~~counterfeit~~ or may contain other ingredients that pose risks to health. ~~In cases like this, it is always a matter of~~ "buyer-beware".

for safety, efficacy or quality.

and consumers should heed the buyer beware principle

(2) We had suggesting moving the following paragraph from the Legal Status section to the HC's Role section. Sue has suggested that we either (1) re-consider the move as the paragraphs before this one speak to the scheduling factors and the fact that we don't have enough information to determine whether scheduling is the best option, and thus beg the question, "well then what is being done to get more information." and flows nicely, OR (2) move to HC's Role section and elaborate on what exactly HC's Role is with respect to these surveys (i.e. funding, etc.) or how HC is going to use the information obtained from these surveys.

Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

(3) We inserted the following sentence under the Risks section, however, the term psychoactive drugs has not been described elsewhere in the document and Sue has suggested that either (1) change the term to hallucinogens, which has been described previously in the document, or (2)

can't condemn all the products out there until we know/ have evidence

well what is your recommendation?

again what do you think I don't have a firm view

provide some examples of psychoactive drugs (i.e. LSD and PCP perhaps)

S. divinorum does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

Sue also wanted to let us know that her contract expires on March 31st and the RFP for the competition to refill the contract has not gone out yet. So....if we want to ensure that there is not a hiatus on the publication of this article she suggested that we request a rush to Lisa MacKay.

who is this?

## Salvia Divinorum

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations (i.e., “seeing” objects that are not there). Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has ~~how it acts~~ (we know how it acts on the brain... salvinorin A on the k-opioid receptor) on the brain and there is no way to predict how it will affect you.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects ~~is capable of acting on~~ the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores, etc. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked, and liquid preparations are also available for consumption. Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ~~ska Maria pastora, ska pastora~~, diviner’s sage, magic mint, puff encens special, and salvia.

### Risks of using *Salvia Divinorum*

*S. divinorum* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product

- how much is used
- how it is taken (e.g., ingested or smoked)
- the user's mood and expectations

~~*S. divinorum* does not appear to cause the euphoria often associated with other hallucinogenic drugs, so many people who try it do not repeat the experience. (While this is true, due to some of the scary experiences some people have, I don't think it's a good idea to put it. People may understand that they can try this drug once without consequence... )~~

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural" does not mean it is safe. *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means that products which that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle. X

Natural health products that have been approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that a product has undergone a rigorous review of formulation, labelling and instructions for use.

### **The Legal Status of *Salvia Divinorum***

Neither *S. divinorum* nor salvinorin A is controlled in Canada under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance

discussed  
in.

- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance
- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, *S. divinorum* is not regulated under the *Controlled Substances Act*, although a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

## Salvia Divinorum

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations (i.e., "seeing" objects that are not there). Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about how it acts on the brain and there is no way to predict how it will affect you.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

could we say "acts on the brain"? just capable

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to induce a "mystical" or hallucinogenic experience.

acting sounds kind of probal rather than known

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinin A – are widely available on the Internet and are sold in various "head shops" and natural food stores, etc. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked, and liquid preparations are also available for consumption. Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

start new para? just didn't flow all in one para?

### Risks of Using *Salvia Divinorum*

*S. divinorum* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations – seems weird to include when substance is listed as hallucinogen
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used

- how it is taken (e.g., ingested or smoked)
- the user's mood and expectations

*S. divinorum* does not appear to cause the euphoria often associated with other hallucinogenic drugs, so many people who try it do not repeat the experience.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is <sup>that</sup> plant-based or "natural", <sup>it</sup> does not mean it is safe. *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that a product has undergone a rigorous review of formulation, labelling and instructions for use.

### The Legal Status of *Salvia Divinorum* in Canada

Neither *S. divinorum* nor salvinorin A ~~is controlled~~ <sup>are currently regulated</sup> in Canada under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to ~~regulate~~ <sup>add</sup> a substance ~~under~~ <sup>to one of the Schedules</sup> the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse <sup>liability?</sup> of the substance

Potential for abuse (accessibility) stability

can use use dependence? or is she suggesting that

use in manufacturing

(str.)

the use of that technology

- the extent of actual abuse ~~and misuse~~ of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

we are moving away from a misuse of as covers more than what we are interested in

regulation under the CDSA

In the case of *S. divinorum*, there is simply not enough information available to determine whether ~~prohibition~~ is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, *S. divinorum* is not regulated under the *Controlled Substances Act*, although a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject It's Your Health - Salvia Divinorum - Draft Two

Good afternoon,

Thank you for your thoughtful comments on the first draft of this IYH article. Some of the comments could not be incorporated due to IYH format issues, but I've discussed matters with Cheryl, and we think this version, Draft Two, is a good compromise in terms of the order in which various bits of information are presented. Valerie, you'll see that I added a link to HC's NHP Web site in the "Need More Info?" section.

If you have any questions about why a specific comment was not incorporated, please contact me directly so we can chat about it.

Otherwise, I look forward to hearing back from you with your thoughts on this version.

The draft article will not be sent into the formal IYH approvals process until you are satisfied with the content and tone.

Thanks again,  
Sue

## **Salvia Divinorum**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations (i.e., “seeing” objects that are not there). Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about how it acts on the brain and there is no way to predict how it will affect you.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it is capable of acting on the mind.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to induce a “mystical” or hallucinogenic experience.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores, etc. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked, and liquid preparations are also available for consumption. Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

### **Risks of using *Salvia Divinorum***

*S. divinorum* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used

- how it is taken (e.g., ingested or smoked)
- the user's mood and expectations

*S. divinorum* does not appear to cause the euphoria often associated with other hallucinogenic drugs, so many people who try it do not repeat the experience.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural" does not mean it is safe. *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that a product has undergone a rigorous review of formulation, labelling and instructions for use.

### **The Legal Status of *Salvia Divinorum***

Neither *S. divinorum* nor salvinorin A is controlled in Canada under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to regulate a substance under the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits)
- the potential for addiction and abuse/misuse of the substance

- the extent of actual abuse and misuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether prohibition is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, *S. divinorum* is not regulated under the *Controlled Substances Act*, although a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject Re: Fw: Media Lines for Salvia Divinorum

Hi Stephanie,

We're fine with the changes that HPFB has proposed to the media lines on *Salvia divinorum*. One more small change on our end under the Background section...

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.

Just wondering what the next step is approval process wise? To our ADM via communications?

Thanks,

## Salvia Divinorum

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations (i.e., "seeing" objects that are not there). Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain and there is no way to predict how it will affect you.

**Comment:** We know how it acts on the brain...salvinorin A on the k-opioid receptor

**Deleted:** how it acts

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

**Comment:** "capable" sounded probable rather than known.

**Deleted:** is capable of acting on

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for medicinal and spiritual purposes. Traditional use involves chewing the leaves or using them to make a tea to treat such conditions as headache or stomach upset, or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores, etc. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked, but liquid preparations are also available.

**Deleted:** and

**Deleted:** for consumption

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

**Comment:** New paragraph

### Risks of Using *Salvia Divinorum*

**Deleted:** u

*S. divinorum* acts as a hallucinogen, which means that it distorts reality. The effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations
- out-of-body experiences
- loss of consciousness
- short-term memory loss
- uncontrollable laughter
- impaired ability to speak

**Comment:** Do we need to list when we already describe substance as a hallucinogen?

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product
- how much is used
- how it is taken (e.g., ingested or smoked)
- the user's mood and expectations

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage
- whether it causes physical dependence or addiction
- how it interacts with other substances (including other drugs and alcohol)

**Comment:** May be misinterpreted as drug could be tried once without consequence.

**Deleted:** *S. divinorum* does not appear to cause the euphoria often associated with other hallucinogenic drugs, so many people who try it do not repeat the experience.¶

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural", it does not mean it is safe. *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means that products which contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

**Deleted:** that

Natural health products that have been approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN) or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM)

These numbers let you know that a product has undergone a rigorous review of formulation, labelling and instructions for use.

### The Legal Status of *Salvia Divinorum* in Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

**Deleted:** controlled in Canada

**Deleted:** regulate

**Deleted:** under

- international requirements and trends in controlling the substance
- similarity to other substances already regulated under the CDSA
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.)
- the abuse liability and potential for addiction of the substance

**Deleted:** and abuse/misuse

- the extent of actual abuse of the substance in Canada and elsewhere
- overall risk to public health and safety posed by the substance

Deleted: and misuse

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

Deleted: prohibition

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, *S. divinorum* is not regulated under the *Controlled Substances Act*, although a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

### 3. PURPOSE

To assess *Salvia divinorum* against the criteria for the addition of a substance to one of the Schedules to the *Controlled Drugs and Substances Act* (CDSA), in order to determine whether or not *S. divinorum*, and/or its psychoactive ingredient, salvinorin A, should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup>

In Canada, neither the herb *S. divinorum* nor its main active ingredient, salvinorin A, are controlled under the CDSA. *S. divinorum* does however meet the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that ~~these~~ products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market. ~~As such,~~ it is difficult to ascertain how much *S. divinorum* is currently sold or consumed in Canada at the present time. Several challenges also arise with respect to the importation and domestic movement of such products as they are often declared as incense and therefore cannot be considered non-market natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling clearly indicates that the product is to be used for consumption and/or pharmacological effects (ie. statements regarding contraindications or restrictions on use) upon which the product will no longer meet the definition of a consumer product (i.e. incense) and will meet the definition of a NHP. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above. While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc. *OK*

but it is also hard to know because no have tool to track or cant find but can relate two ideas so clear

1 U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

2 Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

SR wonder whether all this detail re. NHP status shouldn't go under description or

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction event reports (ADRs) associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol ~~and the concomitant condition of~~ Attention Deficit Disorder.

*in a person diagnosed with*

Further to the receipt of the aforementioned ADRs ~~and with due regard to the limitations of the NHPR with regards to the regulation of *S. divinorum*~~, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* be regulated as a controlled substance. This recommendation was maintained when the IAS was updated in November 2006.

Later, in June 2007, MHPD and NHPD developed a Signal Assessment (SA) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that products containing *S. divinorum* should be restricted from over the counter sale because they constitute a Type II health risk (reasonable probability that the use of or exposure to the product will have mild or moderate adverse health consequences).

*But if you are going to go through history need to complete story i.e. rec that*

#### 4.1 Legislative Frameworks for Drug Control in Canada

*regulate as cont. subst.*

##### 4.1.1 Food and Drug Regulations

*+ meetings between HPFB and HFECSB; clarification of CDSA and*

*Add left of drug*

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned. *If agreement to do this sched. assessment*

##### 4.1.2 Natural Health Product Regulations

*Add line on what eye led*

The definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR) has both a function and substance component.

The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or

*4.1.1 + 4.1.2 - sections shld have consideration L 1 1 000228  
So why no definition in 4.1.1*

- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein, is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The ~~Controlled Drugs and Substances Act~~ (CDSA) provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule to the CDSA is should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Abuse liability and potential for addiction of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

#### 4.2 **Assessment of *Salvia Divinorum* for Scheduling Purposes**

##### 4.2.1 International Requirements and Trends in Control/Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A <sup>are</sup> listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of November 2008, thirteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Mississippi, Missouri, North Dakota, Oklahoma, and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law. California, Louisiana, Maine and Tennessee have

consisting of what is

meaning what

eighteen years of New para  
age or over

enacted other forms of legislation restricting the distribution of the plant. For example, effective January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than 6 months, by a fine of no more than \$1,000, or both. In 2005, Louisiana passed a bill, which made 40 plants, including *S. divinorum*, illegal if sold for human consumption. In Maine, *S. divinorum* and salvinorin A are regulated similar to how tobacco products are controlled. Adults 18 and over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of 18 is a criminal offense. Possession by a minor is a civil violation, punishable by a fine, community service, or both. On July 1, 2006, Tennessee classified the knowing production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is however not a criminal offense to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes, and does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug. Legislative bills proposing regulatory controls are pending in Michigan, New Jersey, New York, Ohio, Pennsylvania, Texas and Wisconsin. In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implication.

should go with so federal consent i.e. after sentence about CSA...

Although

possession of?  
sentence - is not clear

deliberate

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", but no substantiation of this risk was provided at the time of this scheduling decision.

Shortly after, in 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Possession carries a penalty of up to two years in prison.

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum*, and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella I" of the *Tabella Sostanze Stupefacenti o Psicotrope*. (only possession?)

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other alleged "toxic" herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use is not subject to criminal offences.

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances.

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of

selection should be chronological so more ahead of text on US situation

are considered to be

text is before to

controlled substances. Salvinorin A ~~was one of the newly listed substances.~~ The drugs will be banned under a revised pharmaceutical law, under which their import, production, and sale, ~~except for~~ <sup>ie., that</sup> medical treatment or research purposes, will be subject to up to 5 years imprisonment or to a fine of up to five million yen. <sup>beyond</sup>

*S. divinorum* (plant and plant parts) was added to Appendix I of the Narcotics Act in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A. <sup>italies</sup>

In Norway, Finland, Estonia, and Iceland *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

possession too?

#### 4.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoid <sup>are</sup> *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>3</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens, <sup>and</sup> affects the brain in a way that is quite unique.<sup>4</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>5</sup> <sup>IT laws</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by LSD or PCP.<sup>6</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>7</sup> Its strong dissociative effects are often compared to those of ketamine. Users ~~felt~~ <sup>have</sup> that the psychedelic effects of *S. divinorum* were most similar to psilocybin mushrooms.<sup>8</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical <sup>reported</sup>

those caused by

swelling of the stomach.<sup>16</sup> Its main use is for its psychoactive properties in the aid of ~~spiritual~~ ~~rituals~~ to produce "mystical" or hallucinogenic experiences.<sup>17</sup> *is however* *as part of spiritual rituals*

②

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>18</sup>

①

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

Dependence and Abuse  
4.2.4 Abuse Liability and Potential for Addiction

The onset and intensity of the effects of *Salvia divinorum* are related to the route of administration by which it is taken. Traditional uses generally produce mild effects because the leaves are rolled *and* *chewed* ~~masticated and swallowed~~ or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on ~~the~~ contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. Onset of effect generally takes 5-10 minutes which build over the next hour and last for another hour before the effects begin to subside.<sup>19</sup> *appear to be*

Routes that avoid the hepatic first-pass effect are the quickest and most intense.<sup>20</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500µg of salvinorin A powder to produce an effect. ~~Its effects are identical to those of the fresh leaves.~~ The onset of effect felt from vaporizing ~~the~~ salvinorin A powder is about 30 seconds and last for about 5-10 minutes and subside over the next 30 minutes.<sup>21</sup> *effects*

*the same can't say this implies that any use is abuse*

~~For abuse purposes.~~ Smoking is by far the most popular method of administration.<sup>22</sup> ~~People~~ *and this is accomplished by smoking* smoke the dried leaves or a concentrated extract using a pipe or bong. ~~The~~ dried leaves may be *also*

What powder?

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming.<sup>24</sup> ~~Therefore, while these opioid drugs are effective pain relievers, activation of the MORs causes euphoria which implicates these drugs in the development of dependence. An increase in dopamine release in the brain's reward pathway mediated by MOR activation is thought to play a role in the process of addiction.~~<sup>25</sup> As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR). In contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression, however, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>27</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

Few studies have looked at salvinorin A and its abuse liability. Recent animal studies have attempted to address the aversive and dysphoric effects that are induced from salvinorin A use, however, there are some inconsistencies as these studies were performed in different animal models and various evaluation tools were used, therefore, it is difficult to assess the nature of the conflicting results. Further studies on the mediated decrease of dopamine as well as the impact of dose on the reward and aversive effects are warranted.

agonists would predict that the risk of addiction to *S. divinorum* is negligible. However, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Therefore it is sometimes difficult to predict abuse liability in humans from animal studies. More controlled, systematic research in this area is needed.

X

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>29</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>30</sup> Interestingly though, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>31</sup> Unfortunately, to our knowledge, there is no current prevalence data on *S. divinorum* use.

Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 µg had profound hallucinogenic effects.<sup>32</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, even poor yields of a gram per kilograms of dried leaves would provide a dose for 2000 human doses.<sup>33</sup>

ok  
but  
place  
men  
?

This easy isolation makes buying the drug quite affordable. *S. divinorum* leaves sell for \$0.50-7 per gram, plants for \$20-45 and the liquid extract for \$4-10 per millilitre.<sup>34</sup>

#### 4.2.5 Extent of Actual Abuse in Canada and Internationally

- ① Health Canada does not currently have statistics on the actual population use of *Salvia divinorum* across the Canadian population. In an effort to address this lack of data, questions regarding the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. <sup>20</sup> <sup>21</sup> But data from these surveys will not likely be available until 2010. <sup>22</sup> In addition, a general open-ended question about the use of other substances has been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. Results from that survey will be available in the summer of 2009.

however.

Health Canada has only received a limited number of communications regarding *S. divinorum*

<sup>29</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.reserach.hazelden.org](http://www.reserach.hazelden.org).

from law enforcement agencies, and none has advised that the use of *S. divinorum* poses any particular threat to public safety.

As mentioned above, Health Canada received four adverse drug reaction event reports (ADRs) in 2004 associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol and the concomitant condition of Attention Deficit Disorder.

In the United States, a 2006 National Survey on Drug Use and Health Report, published in February 2008 by the Substance Abuse and Mental Health Administration estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* in their lifetime, with approximately 750,000 having done so in the past year;
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (> 26 years of age);
- Young adults were nearly three times more likely than youths, aged 12 to 17, to have used *Salvia divinorum* in the past year; and
- Use was more common in males than in females.

Two reports regarding the abuse of *S. divinorum* have been published in the academic literature. The first was an international case report in which a young man (19 years of age) described his perceptions after inhaling the smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves.<sup>35</sup> The second case involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of *Salvia* use.<sup>36</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case ~~report~~ was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for unknown period of time.<sup>37</sup> It should be noted that alcohol and general depression were the main confounders in this case. This case did, however, result in the state of Delaware passing a law outlawing *S. divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances.

<sup>35</sup> **Error! Main Document Only.** Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? <sup>36</sup> **Error! Main Document Only.** Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

<sup>37</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

this is not about ab 4  
my it is not understanding  
not reports did not  
when so de for  
abuse ?

again this is good info not specific to abuse (extent of)

is descriptive effects abuse?

might fit better overall risk to health and safety

It has been suggested that *S. divinorum* is the most marketed herbal substances available for use as a legal alternative to illicit drugs of abuse, among adolescents and young adults.<sup>38</sup> In 2000, a large number of *S. divinorum* plants were seized at a large scale plantation in Switzerland, which may suggest that its use as a recreational drug in Europe may be increasing.<sup>39</sup>

Again pieces in this section need to flow better - is this what you meant?

#### 4.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen may be on the rise in Canada. It is, however, premature to make this assumption as Health Canada presently does not have any viable statistics on the actual population use of *S. divinorum* across the Canadian population.

so why in this section?

Part of *S. divinorum*'s abuse potential stems from its availability. As previously mentioned it is widely available for purchase on the Internet through drug promotional sites and is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling the drug quite affordable and attractive.

not here!

It is difficult to determine the abuse liability of *S. divinorum* as human studies on its use are scarce, and while most websites tout the drug as being "nothing for beginners", recommend that one has a 'sitter' to watch him/her while on the drug due to its profound dissociative effects,<sup>40</sup> and experiences are described by users as being "intense", "very intense" or "extremely intense"<sup>41</sup> there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>42</sup> however, this aversion to the drug is not an effect being echoed in other studies and reports.<sup>43</sup> Moreover, over eighty percent of users surveyed on a web-based questionnaire about their

<sup>38</sup> **Error! Main Document Only.** Siemann et al., *Salvia divinorum*-representation of a new drug in the internet. 2006; *Gesundheitswesen*, 68(5):323-7 and **Error! Epub 2005 Sep 13.

<sup>39</sup> **Error! Main Document Only.** Giroud C, Felber F, Augsburg M, Horisberger B, Rivier L, Mangin P. 2000. *Salvia divinorum*: an hallucinogenic mint which might become a new recreational drug in Switzerland. *Forensic Science International* 112: 143-150.

<sup>40</sup> <http://www.sagewisdom.org>

<sup>41</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>42</sup> Turner DM. *Salvinorin - The Psychedelic Essence of Salvia Divinorum*. Panther Press, San Francisco, CA 1996.

<sup>43</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62, Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5, and Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs*. 1994 Jul-Sep;26(3):277-83.

Same / have  
*S. divinorum* use said they would probably or definitely use *S. divinorum* again.<sup>44</sup> Therefore, despite the fact that users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>45</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>46</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug,<sup>47</sup> it is difficult to determine the influence these effects on the use of *S. divinorum*.

~~In addition,~~ the potential for harm to the user and/or other individuals may be increased as users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, distinction between self and surroundings is lost, and at doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>48</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also not received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like all drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>49</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

✓ Health Canada has only anecdotal information about the use of *S. divinorum* in Canada and the risk of abuse and/or risk that *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *S. divinorum*.

DRAFT  
April 7, 2009

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### **Supplementary Messages:**

#### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- *Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

## **Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products with *Salvia divinorum* has already been placed with Canada Border Services Agency.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Abuse liability and addiction potential of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*.

Health Canada will, however, continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique. *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

DRAFT  
April 7, 2009

## Media Lines Regulatory Control of *Salvia Divinorum*

### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

### Key Messages:

- Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### Supplementary Messages:

#### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws

Deleted: S

Deleted: controlled

restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: is

- *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Deleted: , when associated with health claims, could

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey likely will not be available until 2010.

Deleted: Ontario Student

Deleted: and Health

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: control  
Deleted: and scheduling  
Deleted: scheduled  
Deleted: A  
Deleted: liability  
Deleted: potential of  
Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Deleted: , however,

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

Subject CP - B.C. survey of teens shows marijuana use down but  
prescription drug abuse up

Apr 14 2009 15:37:00 - Source: HEA [The Canadian Press]

B.C. survey of teens shows marijuana use down but prescription drug abuse up  
(Adolescent-Health)  
VANCOUVER \_ A survey of B.C. teens suggests fewer are using  
marijuana but more are abusing prescription and hallucinogenic drugs  
such as ecstasy.

The study by the McCreary Centre Society suggests pot smoking  
among teens has fallen for the 10th year in a row \_ down to 30 per  
cent from 37 per cent in 2003.

But according to the survey of 29,000 students, there's been a  
six per cent jump in adolescents trying prescription drugs without a  
doctor's supervision and a nine per cent increase in use of  
hallucinogens since 2003.

Executive director Annie Smith says the survey of Grades seven to  
12 students doesn't explain why more are abusing prescription drugs  
and hallucinogens.

She says recent studies in other provinces have found a similar  
trend and the society will explore that further in future workshops  
with teens.

The 2008 survey of physical and emotional health also suggests

that the majority of B.C. youth are in good health, feel connected to their family, school and community and are smoking and drinking less than teens in 2003.

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;

- how much is used;
- how it is taken (e.g., ingested or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage;
- whether it causes physical dependence or addiction;
- how it interacts with other substances (including other drugs and alcohol).

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* may meet the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

OK  
remember  
to file  
about  
side effects  
of use?

Natural health products that have been reviewed and approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability of the substance and the potential for addiction;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, it is not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

## ***Salvia divinorum* - Draft Three**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain and there is no way to predict how it will affect you.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;

- how much is used;
- how it is taken (e.g., ingested or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage;
- whether it causes physical dependence or addiction;
- how it interacts with other substances (including other drugs and alcohol).

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with <sup>however</sup> this.)

OK, because talking about addiction or use i.e. (homeopathic) but take out the way.

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* may meet the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, <sup>although</sup> ~~but~~ <sup>that</sup> no NHPs containing this substance have been approved for sale in Canada. This means ~~products that contain S. divinorum~~ <sup>or may not contain Salvia divinorum</sup> have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may ~~be counterfeit or~~ <sup>and</sup> contain other ingredients that pose risks to health, <sup>and</sup> consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A <sup>are</sup> currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

have tried it, generally correct. (gets at counterfeit point without using word which is often misunderstood)

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability of the substance and the potential for addiction;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey, ~~the~~ survey results will help fill some of the information gaps, ~~but the data will not~~ likely be available until 2010,

and these  
however,

In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, it is not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

## ***Salvia divinorum* - Draft Three - NHPD Comments**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain and there is no way to predict how it will affect you.

### **Background**

*Salva divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*Saliva divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- incoordination;
- ~~impaired ability to speak~~: slurred speech.

ack to  
Brittany

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be adulterated with other substances);
- how it is taken (e.g., ingested or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been only a few scientific studies about the way it affects the body and the brain. For example, it is known which brain receptors are targeted by the active ingredient, Salvinorin A, but very little is known about the following:

- how it affects the brain overall, what are the long-term effects, and if it causes permanent damage;
- what effects it has on physical dependence or addiction;
- how it interacts with other substances (including other drugs and alcohol).

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* may meet the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;

- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability of the substance and the potential for addiction;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, it is not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

## ***Salvia divinorum* - Draft Three - MHPD Comments**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain, specifically with respect to permanent damage. There is also ~~and there is~~ no way to predict how it will affect you with each use.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- how it is taken (e.g., ingested [*For consideration - the term 'eaten' may be easily understood by the public*] or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been so few scientific studies about the way it affects the body and the brain. For example, very little is known about the following:

- how it affects the brain and if it causes permanent damage;
- whether it causes physical dependence or addiction;
- how it interacts with other substances (including other drugs and alcohol).

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* may meet the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability of the substance and the potential for addiction;
- the extent of actual abuse of the substance in Canada and elsewhere;

- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with its use. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. The survey results will help fill some of the information gaps, but the data will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum*. In the United States, it is not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on its sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*S. divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;

- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789
- Mail to: Canada Vigilance Program

Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

Subject IYH - Salvia divinorum - Draft Six

Good afternoon to all,

I've attached Draft Six of the IYH on Salvia divinorum, which incorporates the latest comments and revisions received from you.

Through discussions and e-mail communications, we have been able to reach a consensus on a number of proposed revisions and/or deletions suggested in Draft Five. For example, Draft Six accepts the insertion of "awkward sentence patterns" as an effect of using Salvia divinorum and puts back the bullet indicating that "the user's mood and expectations" play a role in the way the effects may differ from one use to the next.

Based on comments from R. Marles and B. Sauvé, Draft Six also removes the reference to "abuse" in the sentence stating that the potential for physical dependence or addiction appears to be low.

There is no highlighter marking changes/items on which consensus has been reached.

In the attached version, there are a couple of minor but important proposed revisions. So that you can find these quickly and easily, the proposed insertions are highlighted in green, while proposed deletions are highlighted in yellow.

Please let me know whether you accept the proposed revisions. If so, I will clean up the draft and send it to the IYH Manager for the formal approvals process.

Thank you very much for all of the work you have put into this article to date.

Best regards,  
Sue

IYH - Salvia divinorum - Draft Six (May 21, 2009).wpd

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain.

There is also no way to predict how it will affect you with each use.

**Deleted:** effect it has on

**Comment:** Agree with Brittany's suggestion to rewrite as indicated.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### Risks of Using *Salvia divinorum*

*Salvia divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

**Comment:** ✓ Agree with proposed addition.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed [redacted] with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- [redacted]

**Comment:** ✓ Agree with proposed addition.

**Comment:** ✗ Disagree with proposed deletion as per Brittany's rationale.

**Comment:** ✓ Agree with proposed change.

A major concern about *S. divinorum* is the fact that there have only been [redacted] a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

**Comment:** ✓ Agree with proposed addition.

The information regarding physical dependence or addiction of *S. divinorum* is unclear, although it appears the potential for this is low.

**Deleted:** or abuse

**Comment:** ✓ Agree with proposed addition and with removal of "of abuse", with one more small change.

**Deleted:** of such issues

## Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

## The Legal Status of *Salvia divinorum*

### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability and the potential for addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

Deleted: of the substance

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess,

use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including effect it has on the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for ~~either of such issues~~ is low.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;

- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse liability of the substance and the potential for risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject Re: IYH - Salvia divinorum - Draft Five

Dear Sue,

I agree with Robin's comment below. I think that its abuse is well-known.

I do not agree with the proposed deletion of "the user's mood and expectations." This is common knowledge for any substance of abuse-legal or illicit. It plays a role in the experience and consequently, the abuse potential of a drug. I have a number of references which state this... I have added one below:

**Potential factors associated with prescription drug  
abuse and addiction**

From a pharmacological perspective, prescription drugs fit into the same drug classes as the usual illicit drugs.

Methylphenidate and amphetamines fit into the stimulant category, like cocaine and methamphetamine, while hydrocodone and oxycodone fit into the category of opioids, like heroin. Thus, the same general pharmacological factors associated with abuse and addiction to non-prescription drugs apply to prescription drug abuse. Key variables that influence the abuse and addiction potential of these agents are: dose, route of administration, co-administration with other drugs, context and expectations.

Compton WM, Volkow ND. Abuse of prescription drugs and the risk of addiction. Drug Alcohol Depend. 2006 Jun;83 Suppl 1:S4-7.

The deletion 'in regards to permanent damage' - I feel with this removed we are back to sounding like we don't know how the drug exerts its effects, when we do. Perhaps, we could write it slightly differently to include the word damage... so it is clear that we are talking about the damage that it causes to the brain. Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain., ~~specifically with respect to permanent damage.~~

Thank you again, I know that it has been more than challenges incorporating all these comments.

Sincerely,  
Brittany

ect

Dear Sue,

Thank you for your patience in dealing with all the changes we have been suggesting. It must seem like herding cats to get us all going in the same direction.

Most of these changes I agree with -- just one exception:

"The information regarding physical dependence or addiction or abuse to *S. divinorum* is unclear, although it appears the potential of such issues is low."

I think it is clear that *S. divinorum* is being abused, it is just that the potential for dependence or addiction is low.

Robin

Subj IYH - Salvia divinorum - Draft Five  
ect

Good morning all,

I've attached Draft Five of the IYH on *Salvia divinorum*, which incorporates a series of comments received regarding Draft Four.

000287

To make the proposed changes apparent, I've used yellow highlighter to mark proposed additions, and green highlighter to mark proposed deletions.

Some of the proposed changes are minor (although important), but two proposed changes appear to be more significant in terms of altering the content:

- 1) MHPD has proposed the addition of a sentence regarding the potential for physical dependence, addiction and abuse. This sentence is found at the end of the "Risks" section.
- 2) MHPD has proposed the deletion of a bullet in the "Risks" section describing why the effects of using the substance may differ from one use to the next. The proposed deletion is "the user's mood and expectations." The reason given for deleting the text is lack of evidence.

Thank you for the time you have spent to date reviewing drafts and providing comments. I think we are close to having a version to submit for formal approvals, and I look forward to seeing/hearing your comments on Draft Five.

Thanks,  
Sue

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain; ~~specifically with respect to permanent damage~~. There is also no way to predict how it will affect you with each use.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed ~~adulterated~~ with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- ~~the user's mood and expectations~~

A major concern about *S. divinorum* is the fact that there have only been ~~one~~ a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction (or abuse) of *S. divinorum* is unclear, although it appears the potential of such issues is low.

### Minimizing Your Risk

for this?

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;

add. the liability potential for abuse

- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the abuse liability of the substance and the potential for addiction <sup>associated</sup> with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject IYH - Salvia divinorum - Draft Four

Good afternoon,

Thank you everyone for your thoughtful comments on Draft Three of the IYH on Salvia divinorum. I've attached Draft Four for review.

Please note that in the section on "Risks of Using Salvia divinorum," the bullet referring to physical dependence and addiction has been removed.

I removed the bullet for the following reasons:

- Robin Marles pointed out that it is not true to state that very little is known about whether or not use of S. divinorum causes physical dependence or addiction. There is information about the brain receptors it acts on, and since use of the substance causes dysphoria, the likelihood of the substance being addictive is relatively low. There is apparently some evidence that use of S. divinorum may have effects on addictions to other substances, but this would be very complicated to explain.
- Brittany Sauvé agreed that it would not be credible to state that little is known about whether or not use of S. divinorum causes physical dependence or addiction. She further stated that, "The information regarding physical dependence or addiction is unclear, although it appears the potential is low."

It would seem that if we want to reference addiction as a risk, we would have to qualify that based on what is known, the potential for physical dependence and addiction is low, although it cannot be ruled out entirely. This may not be a message that HC wants to convey, so for now, I've left out any reference to the potential for addiction. Both R. Marles and B. Sauvé have agreed with this approach, although they would be open to other suggestions.

I'm interested in feedback and perhaps suggested wording if someone thinks that the IYH should contain messages about the potential for addiction. If a message about addiction is going to be put into the article, it would probably fit in best as a separate sentence at the very end of the "Risks of Using Salvia divinorum" section.

When you've had a chance to review this draft, please send back comments or a thumbs up to put this version into the formal approvals process. I am happy to work with you via e-mail or telephone, whichever you prefer.

Thank you very much.  
Sue

IYH - Salvia divinorum - Draft Four.wpd

## ***Salvia divinorum* - Draft Four**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain, specifically with respect to permanent damage. There is also no way to predict how it will affect you with each use.

### **Background**

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*Salvia divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech.

There is no way to predict what effect this substance may have on you. In addition, the effects

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be adulterated with other substances)
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been only a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs and alcohol.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be adulterated with other substances)
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have been only a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs and alcohol.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

NOTE

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Jocelyn, It looks like all of our comments were included with the exception of removing the word "counterfeit" as Sue mentioned that this term has been used in previous LYH articles and wanted to give NHPD some of their ~~inclusions~~

are you ok with that?  
 As per Sue's email they also removed like we: physical dependence / addiction under risks section.  
 Thanks, asked Cheryl Sue to consult with Britney is fine with a note.

whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);

- the abuse liability of the substance and the potential for addiction;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject 2008 BC Adolescent Health Survey

Good morning,

I was just reading through the highlights from the 2008 BC Adolescent Health Survey and would like to if you have any more information with respect to the following key findings, particularity with respect to whether you have a break down on the increase of what specific hallucinogens are being abused.

- Alcohol and marijuana use declined over the past decade, as did the use of some drugs such as cocaine, amphetamines and mushrooms. However, the use of other drugs, including hallucinogens, rose. (Page 7)
- However, there was a rise in the use of hallucinogens, prescription pills without a doctor's consent, steroids and a small rise in heroin use. (Page 33)
- Ever Used Other Drugs Chart - Hallucinogens rose from 7% in 2003 to 9% in 2008 (Page 36)

Subject Re: Fw: It's Your Health - Salvia divinorum - Draft Three

Hi Cheryl,

I was just having a look at everyone's comments. I am okay with the comments made by Mano's group. I think that there may be a simplified way to say "specifically with regards to permanent damage..." but that is for plain language I guess.

As for NHPD, I am okay with most...I trust that what they have added can be found in a reference somewhere. I have a couple of comments on the text below.

A major concern about *S. divinorum* is the fact that there have been ~~only a~~ (seems unnecessary- if to keep... I would say, there have only been a few) few scientific studies about the way it affects the body and the brain. For example, it is known which brain receptors are targeted by the active ingredient, Ssalvinorin A, but very little is known about the following:

- ~~how it affects the brain overall, what are the~~ <sup>what are there</sup> are any long-term effects on the brain and if it causes permanent damage;
- ~~what effects it has on~~ whether or not it causes physical dependence and/or addiction;
- how it interacts with other substances (including other drugs and alcohol).

Other than that I am satisfied with the text....

If you have any questions about my comments just give me a call 948-9405.

THanks,  
Brittany

Hi Robin,

In case you are interested in draft 3...

There doesn't appear to be agreement with moving the street names to the first paragraph of the Background section. I suggested a more specific description of the effects on speech (i.e. slurred speech) as mentioned in this DEA document:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm).

Please send your comments to Cheryl Tremblay.

***Salvia divinorum* – Draft Three – TDD Comments (April 14, 2009)**

**The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) specifically for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Health Canada recommends that you avoid using this substance because very little is known about the effect it has on the brain and there is no way to predict how it will affect you.

**Background**

*Salva divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

**Risks of Using *Salvia divinorum***

*Saliva divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- out-of-body experiences;
- loss of consciousness;
- short-term memory loss;
- uncontrollable laughter;
- impaired ability to speak.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- how it is taken (e.g., ingested or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have only been a few scientific studies about the way it affects the body and the brain. For example, it is known which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- whether there are any long-term effects on the brain and if it causes permanent damage;
- whether or not it causes physical dependence or addiction;
- how it interacts with other substances (including other drugs and alcohol).

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*, however, no NHPs containing this substance have been approved for sale in Canada. This means that products containing *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may contain other ingredients that pose risks to health, or may not contain *S. divinorum* or salvinorin A at all. Consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada will be labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

Hi Ronald,

I was just about to ask you if this had crossed your desk because I was talking with Lisa Mackay (IYH coordinator for HC) about another IYH document and had asked her where the salvia document was at. In any case, there is no need for me to verify anything, Cheryl Tremblay and I were intimately involved in all stages of the document during development and I am very comfortable with its content, as is Suzanne Desjardin and many different parts of HPFB. If you or Diane can indicate your approval, this should move quite quickly through the approvals process until at least ADM level, where I suppose there may be a need for discussion.

Diane, since you are here now, is there a need to make Paul's office aware that this is coming? In theory, Paul knows because he signed off on the concept paper way back when, but I have just realized that technically, we (as in CSTD) have not communicated with him about this specifically? I will ask Stephanie and see what advice she has.

Hello Ronald,

Were you able to review the It's Your Health article below? Or should it go to Diane Allen for approval now?

Thanks,

## Salvia divinorum

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### Background

*Salvia divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### Risks of Using *Salvia divinorum*

*Salvia divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects

is this true?

see paragraph

on page

define - what is this

Is this true? see next page

parag

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

A

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

this is confusing please clarify

↳ there are NHPs in the market that have not been approved  
Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

been approved

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;

- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and these survey results will help fill some of the information gaps. The data, however, will not likely be available until 2010.

↳ data available survey, analysis to 2010

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

Subject Re: Media Lines for Salvia Divinorum 

Hi Cheryl,

The lines are attached below and they went through all of program approvals, but were put on hold before they got to our DG, Comms and above for approval, as they were not deemed a priority at the time. Please let me know if you would like us to continue with the approval of these lines. I am aware that an It's Your Health article on Salvia will be posted soon on HC's Web site so perhaps it is a good time to finalize these lines now.

Hi Christine,

I work with Jocelyn Kula in the Policy and Regulatory Affairs Division at CSTD and was advised that you have taken over the Salvia Divinorum file. I was just wondering if there are any updates with respect to the status of their progress through the approval process?

Thank you,

## Media Lines Regulatory Control of *Salvia Divinorum*

### Issue

Since 2006, Health Canada has <sup>noted a steady</sup> ~~observed a steady increase in the amount~~ of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults <sup>specifically</sup> ~~specifically~~ for its <sup>ability to</sup> ~~hallucinogenic~~ properties.

### Key Messages:

- Health Canada continues to collect <sup>and consider</sup> relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine <sup>the most appropriate strategy</sup> ~~what, if any, regulatory controls are needed.~~
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population. <sup>to manage the risks associated with its use.</sup>
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### Supplementary Messages:

#### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are <sup>regulated?</sup> ~~controlled~~ under the *Controlled Drugs and Substances Act* (CDSA).
- Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

~~under certain conditions of use~~

- ✓ *Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.

- ✓ As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

**If asked for specifics on when the survey data will be available:**

- ✓ Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario ~~Canada~~ <sup>Alcohol and</sup> Student Drug Use and Health Survey likely will not be available until 2010. <sub>Monitoring</sub>

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

- ✓ A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

✓ Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

- ✓ A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

- ✓ A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products with *Salvia divinorum* has already been placed with Canada Border Services Agency.

*not permitted*

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling; *like the substance*
- (Chemical and pharmacological) similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Abuse liability and addiction potential of the substance; *not associated with*
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

\* (Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*.)

*In the case of SD, there is simply not enough info available to determine*

✓ Health Canada will, however, continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

*whether (...)*  
*survey results*

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

✓ A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

✓ *Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet as a "legal" alternative to street drugs.

*and sold in  
weed shops  
normal  
food  
stores.*

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique. (*Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.)

*was previously removed*

### Questions and Answers

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products with *Salvia divinorum* has already been placed with Canada Border Services Agency.

not clear what this means

Comment: Not previously included

is this what 1YH says - not sure I like! implies that salvia has to be sold in certain way or used a certain way to be an NHP and this is just not true!

containing

perhaps last sentence could read:

We can discuss if you like

~~Health Canada~~ The Canada Border Services Agency established an import target for finished ~~salvia~~ products containing salvia... in XXX (year). An import target 000321

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in ~~controlling the substance~~ *regulation (correlative status?)*
- Chemical and pharmacological similarity to other substances already regulated under the CDSA; ✓
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance; ✓
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

- Deleted: control
- Deleted: and scheduling
- Comment: Removed in IYH - but for laymans terms
- Deleted: scheduled
- Deleted: A
- Deleted: liability
- Deleted: potential of
- Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. IYH – In the case of *Salvia divinorum*, there is simply not enough information available to determine whether (controls imposed by CDSA... + mention survey results will help fill some of the information gaps)

Formatted: Font: Italic, Complex Script Font: Italic

Health Canada will, however, continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

you as long as  
tee up with  
next sentence  
otherwise it  
seems duplicati  
?

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

**Response to ADM Questions Regarding the IYH article on *Salvia Divinorum*  
June 23, 2009**

**(1) Where are our standard lines around drug prevention?**

The standard lines on drug prevention were not incorporated in this IYH because the wording of those lines is oriented around illicit drugs which are already regulated as controlled substances. They do not translate well to *Salvia divinorum* in light of the fact that neither this plant nor its active ingredient are regulated as controlled substances at this time. The preliminary findings of our scheduling assessment are that information about the different factors considered, e.g., the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally and the overall risk to public health and safety posed by the substance, is either missing or anecdotal in nature and thus, the controls imposed by the CDSA are likely not warranted. It is because of these preliminary findings that this IYH was contemplated. *Salvia Divinorum* continues to attract moderate media attention and it was thought that it would be beneficial to have information available on the internet that would better inform the general public about the issue, i.e., health effects and what they can do to safe guard their own health. In this regard, the language used in the article is focused on the fact that Health Canada does not know very much about how it acts on the brain and the body and thus does not recommend that people use it.

**Is it normal to include information with respect to the status in other countries in an IYH article? (as written it seems to generate more questions than provide answers)**

The information regarding the status of *Salvia divinorum* and its active ingredient salvinorin A in other countries was included as it pertains to one of the factors that Health Canada considers when assessing whether to add a substance to one of the schedules to the CDSA, i.e., international requirements and trends in controlling the substance. This information could however be removed from the document without disrupting the flow of the article if there are concerns with its inclusion. The content of the article has however already been approved by HPFB and so we would need to go back to them for approval if this type of revision were to be made.

June 23, 2009

## **Its Your Health Proposed Article**

It's Your Health articles answer frequently asked questions from the general public and provide health protection advice. Each IYH article is roughly 2 pages long, with a grade 8 to 10 "readability" level. The target audience is the general public, and plain language is used whenever possible. Links to detailed technical or scientific information can be provided in the "Need More Info?" section. These publications are distributed to: doctors and their clients, teachers and students, magazine editors and their subscribers, other federal and provincial departments, private firms, Health Canada and Public Health Agency of Canada employees. This publication is also posted on Health Canada and PHACs official Web sites.

**Author and Date of Proposal** - *Lisa Holmes - October 17, 2008*

**Proposed Title** - *Salvia divinorum*

**The Issue** - *Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.*

*Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.*

**Health Canada's Role** - *There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.*

**Why is this article needed and why It's Your Health ?-** *The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.*

**Are other communications products being considered, will they be used ?-**  
*Media lines.*

**Is there a deadline for producing the IYH article** - *While it is not part of a larger*

*announcement, it would be beneficial to have this article produced and posted as soon as possible, as there continues to be media attention and public interest on the issue.*

**Who in the department needs to provide input and who would be the lead contact ?-** *Andrew Adams, Director, Drug Analysis Services, HECS; Ranjan Bose, Manager, Marketed Biologicals, Biotechnology and Natural Health Products Bureau, Marketed Health Products Directorate, and Dr. Helmi Hussien, A/Director, Bureau of Clinical Trials and Health Sciences, Natural Health Products Directorate, HPFB.*

**Who in the department or outside of the department should approve this article?** - *Health Canada only.*

**Is there a plan for Stakeholder involvement or dissemination when article is completed?:** *No stakeholder plan - we will refer media to this article.*

### Past Year Use of Salvia Divinorum

(Figure 3.6.8)

Salvia divinorum is a legal plant, which can be purchased online or in "head shops," that causes hallucinations and delusions. This drug can be ingested by chewing the fresh leaves, drinking their extracted juices, or smoking the dried leaves. For the first time in 2009, students were asked about their use of this drug with the question: "In the last 12 months, how often did you use salvia divinorum (also known as 'sally-D', 'magic mint', 'sadi')?"

2009: Grades 7 to 12

- Among all students in 2009, 4.4% (range: 3.3%-5.7%) report using salvia divinorum at least once in the past year. This percentage represents about 42,600 students in Ontario.
- Males (6.2%) are significantly more likely than females (2.3%) to use salvia divinorum.
- There is significant grade variation, with salvia use most likely among 11<sup>th</sup>-graders (8.6%) and 12<sup>th</sup>-graders (8.4%).
- There is significant regional variation, with students in the North (9.2%) most likely to use salvia.

Figure 3.6.8  
Past Year Salvia Divinorum Use by Sex, Grade and Region, 2009 OSDUHS

Vertical bars represent 95% confidence intervals; horizontal bar represents 95% CI for total estimate; estimates for grade 7 and grade 8 were suppressed

Subject Re: Paul's comment on Salvia IYH 

Thanks. Based on this, I think a plainly worded explanation on why standard text is not being used would be helpful so let's tackle it from that perspective. Also, a few lines addressing other questions and a comment on the issue of approvals should assist in putting it to rest.

Could you please craft a response to this effect for Diane's review and we'll go from there.

Thanks much.

Subject Re: Paul's comment on Salvia IYH 

We can look at the wording but I am not sure the standard lines on drug prevention really work here because they are really oriented around illicit drugs (which are regulated as controlled substances) and the whole point of doing this IYH is that salvia is not yet regulated as a controlled substance and the preliminary findings of our scheduling assessment are that it does not warrant these types of controls. Hence the language about not knowing very much about how it acts on the brain and the body, and that we don't recommend that people use it....

Cheryl (analyst responsible) is away today but we will get something back to DGO as soon as possible. That said, if Paul really wants changes, we are going to have to go all the way back through approvals in HPFB as this IYH has been a co-production if you will, and it is my understanding from Comms that Meena has already signed off.

JK

2) re: the Status in Other Countries section - is that normal to include this in an IYH article?

Salvia divinorum

The Issue

Reports suggest that Canadian teens and young adults are using a substance called Salvia divinorum (S. divinorum) for its ability to produce hallucinations. Certain Web sites are also promoting the use of S. divinorum as a "legal" alternative to street drugs.

Street names for S. divinorum include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora. diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

Background

S. divinorum is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain S. divinorum - or its main active ingredient, salvinorin A - are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Risks of Using Salvia divinorum

S. divinorum's effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

Happy to discuss. Paul Williams  
As written it seems to generate more questions than provide answers.

Cheryl - these are Paul's handwritten notes that I forwarded on to you via email. Pls see my note to Jay Khosla and his response. For Action ASAP pls.

**Response to ADM Questions Regarding the IYH article on *Salvia Divinorum*  
June 23, 2009**

**(1) Where are our standard lines around drug prevention?**

The standard lines on drug prevention were not incorporated in this IYH because the wording of those lines is oriented around illicit drugs which are already regulated as controlled substances. They do not translate well to *Salvia divinorum* in light of the fact that neither this plant nor its active ingredient are regulated as controlled substances at this time. The preliminary findings of our scheduling assessment are that information about the different factors considered, e.g., the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally and the overall risk to public health and safety posed by the substance, is either missing or anecdotal in nature and thus, the controls imposed by the CDSA are likely not warranted. It is because of these preliminary findings that this IYH was contemplated. *Salvia Divinorum* continues to attract moderate media attention and it was thought that it would be beneficial to have information available on the internet that would better inform the general public about the issue, i.e., health effects and what they can do to safe guard their own health. In this regard, the language used in the article is focused on the fact that Health Canada does not know very much about how it acts on the brain and the body and thus does not recommend that people use it.

**Is it normal to include information with respect to the status in other countries in an IYH article? (as written it seems to generate more questions than provide answers)**

The information regarding the status of *Salvia divinorum* and its active ingredient salvinorin A in other countries was included as it pertains to one of the factors that Health Canada considers when assessing whether to add a substance to one of the schedules to the CDSA, i.e., international requirements and trends in controlling the substance. This information could however be removed from the document without disrupting the flow of the article if there are concerns with its inclusion. The content of the article has however already been approved by HPFB and so we would need to go back to them for approval if this type of revision were to be made.

DRAFT  
April 7, 2009

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

#### Key Messages:

- Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Deleted: relevant

Deleted: S

Deleted: Ontario Student

Deleted: and Health

#### Supplementary Messages:

##### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws

Deleted: S

Deleted: controlled

restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: is

- *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.

Deleted: , when associated with health claims, could

- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

**If asked for specifics on when the survey data will be available:**

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey likely will not be available until 2010.

Deleted: Ontario Student

Deleted: and Health

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: control

Deleted: and scheduling

Deleted: scheduled

Deleted: A

Deleted: liability

Deleted: potential of

Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Deleted: , however,

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

bcc Cheryl Tremblay/HC-SC/GC/CA  
Subject [REDACTED]

Hi Bronwyn,

After taking a closer look at the media lines for *Salvia divinorum* we would like to propose that the following revision be made to the IYH on *Salvia* ( 2nd paragraph under Minimizing Your Risk on page 2) There was some back and forth regarding the inclusion of this statement during the development of the document however the inclusion of "under certain conditions of use" is simply not true in that it implies that *Salvia divinorum* has to be sold or used a certain way to be considered an NHP.

"Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. ~~Under certain conditions of use,~~ *Salvia divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations* . However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle."

Thanks,  
Cheryl

DRAFT - Media Lines Oct 20 2008\_NHPD.wpd

Hi Cheryl,

I've had the chance to look over these media lines, and I don't have much in the way of comment (please see my comments in blue in the attached document).

I just wanted to let you know that Robin is away on French training, and only forwarded this to me yesterday. As a result I haven't had the chance to ensure that all the appropriate people at NHPD have had the chance to provide comment.

**Kyra:** I think you were involved in this issue at some point. Do you have any comments, or know of anyone else that may need to be consulted?

Thanks,  
Stephanie

Subject Revised Media Lines for Salvia Divinorum

Good Afternoon,

Further to inter-branch meetings between HPFB (NHPD, MHPD, HPFBI) and HECSB (DSCSD), held in May 2007, September of 2007, and September 2008 regarding *Salvia divinorum*, DSCSD is working to update and finalize the media lines on this substance.

Please find attached, a copy of the revised media lines for *Salvia divinorum* for your review and comments. Please forward any comments to me by Tuesday, October 28, 2008.

HECSB Communications will coordinate senior management approvals once we have received and considered all working level input.

Subject IYH on Salvia divinorum - Ready for the formal approvals process

Good morning Lisa,

I've attached Draft Seven of the IYH on Salvia divinorum and am requesting that you start it through the formal approvals process.

The following Program Contacts all gave a thumbs up for Draft Six to go into formal approvals: Jocelyn Kula, Cheryl Tremblay and Brittany Sauvé (HECS-B), Robin Marles and Valerie Hurry (NHPD), and Robert Leitch and Mano Murty (MHPD).

The only differences between Draft Six and Seven are as follows:

- highlighter and strikethrough marking changes to text in Draft Six were removed for Draft Seven, as all changes were agreed upon by the Program Contacts
- at the suggestion of Brittany Sauvé, a reference (and link) to a provincial survey (Ontario) asking questions about Salvia use was replaced with a reference (and link) to a national survey that is asking

Hi John,

Further to our conversation this afternoon, PRAD would like to submit the following topics for your consideration for the 2010 Wave 1 CTUMS. I've attached some reference documents to give up a quick update on these substances, however, please do not disseminate as these media lines have not made their way through formal approvals.

Salvia Divinorum

contenu de la phase 1 de l'ESUTC de l'année 2010

Hello,

We are starting to review the content for the CTUMS 2010 Wave 1 (February - June). Please find attached the 2009 Wave 2 questionnaire for your information. If you have any surveillance ideas that you would like to have considered for 2010 Wave 1, please send them by noon August 12, 2009 to John

Stevenson, Survey Methodologist, Office of Research, Surveillance and Evaluation, at  
john\_stevenson@hc-sc.gc.ca or at 613-948-2627 if you have additional questions.

Thank you for your input,

---

Bonjour,

Nous commençons à examiner le contenu de la phase 1 de l'ESUTC de l'année 2010 (février - juin).  
Veuillez trouver ci-joint le questionnaire de la Phase 2 de l'année 2009 pour votre information. Si vous  
avez des idées de surveillance que vous aimeriez considérer pour la phase 1 de l'année 2010, veuillez  
envoyer vos commentaires d'ici midi, le 12 août 2009 à John Stevenson, Enquêteur de la méthodologie,  
Bureau de la recherche, de la surveillance et de l'évaluation, à john\_stevenson@hc-sc.gc.ca ou au  
613-948-2627 si vous avez des questions supplémentaires.

Merci pour vos commentaires,

Cheryl,

So if I have it correct, you are looking for additional questions on:

1. Salvia Divinorum; and
2. "Spice"?

I will put in for consideration Ever Use (lifetime) and Past 30-day Use as we do with all of the tobacco products on the CTUMS.

Thanks,

Hi Cheryl,

I haven't done anything with the media lines, because I wanted to wait until Paul had signed off on the article so I would know if further changes needed to be made.

As for the article, Jay Khosla's email with responses to Paul's comments got lost for about a month, and it's now back with Paul's advisor. I'll follow-up on that the article this morning.

Thanks,

Morning Bronwyn,

Any news on what stage the media lines on Salvia are at? We provided the comments attached below on June 23rd.

Anything new on the IYH on Salvia? We responded to some of the ADMs comments on June 23rd as well. Are they going up for formal approvals together?

Reason I ask is that CBSA is asking for some info on whether HC regulates it and we would like to provide them with a few lines.

Thanks,

Subject Fw: Status of Salvia

Hi Mark,

Sorry for the late reply, I just wanted to verify the status of the media lines before forwarding along. I've attached the most recent version. They have not been approved by ADMO yet as they are waiting for the approval on the It's Your Health article on Salvia first to see if any changes to that document need to be reflected in the media lines. Paul and Cathy are supposed to discuss the IYH article and their next bilat when she returns from holidays. So... I wouldn't send them the whole doc, maybe just select a few additional lines to add context?

DRAFT  
April 7, 2009

## Media Lines Regulatory Control of *Salvia Divinorum*

### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

### Key Messages:

- Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Deleted: relevant

Deleted: S

Deleted: Ontario Student

Deleted: and Health

### Supplementary Messages:

#### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws

Deleted: S

Deleted: controlled

restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: is

- *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Deleted: , when associated with health claims, could

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey likely will not be available until 2010.

Deleted: Ontario Student

Deleted: and Health

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

**Deleted:** control  
**Deleted:** and scheduling  
**Deleted:** scheduled  
**Deleted:** A  
**Deleted:** liability  
**Deleted:** potential of  
**Deleted:** and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Deleted:** , however,

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S.

Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

What is Health Canada doing to protect Canadians from the potential adverse effects associated with the use of Salvia divinorum?

Français:

Quelles mesures Santé Canada prend-il pour protéger les Canadiens contre les effets indésirables possibles liés à l'utilisation de la Salvia divinorum?

English:

Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Scientific info

Health Canada does not currently have statistics on the use of *Salvia divinorum* across the Canadian population. Health Canada is taking steps to address this lack of data by including questions regarding the use of *Salvia divinorum* to the 2008-2009 Youth Smoking Survey and to the 2009 Canadian Alcohol and Drug Use Monitoring Survey.

The results from these surveys, ~~which will not likely be available until 2010~~, <sup>to</sup> will help fill some of the information gaps and will assist Health Canada in determining the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum*.

In the meantime, He is preparing a

Français:

~~IVH~~ ~~est~~ ~~inséparables~~ ~~matériaux~~

## BACKGROUND - CONTEXTE

English:

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

The main active ingredient of *Salvia divinorum* is salvinorin A. Salvinorin A is a highly efficacious *kappa*-opioid receptor agonist, and as such, this substance has been used to investigate the pharmacological contribution of this opioid system to the etiology of depression, dementia, bipolar disorder and schizophrenia.

*Salvia divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults. While very little is known about how and where *Salvia divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, ~~and~~ alternative life style stores, etc.

#### Regulatory Control of *Salvia divinorum*

In Canada neither the herb, *Salvia divinorum*, nor its main active ingredient salvinorin A, are regulated in any Schedule to the *Controlled Drugs and Substances Act* (CDSA).

*Salvia divinorum* does meet the definition of a "natural health product" (NHP) under the *Natural Health Product Regulations* (NHPR), which means that products that are not in compliance with the NHPR may be subject to compliance and enforcement actions, however, Health Canada has not approved any NHPs containing this substance for sale in Canada and it does not appear to be sold as a "health product."

*Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

#### Current Situation in Canada

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database, however, the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

*Salvia divinorum* could <sup>potentially</sup> also be scheduled under the CDSA. In contemplating whether to add a substance to one of the schedules to the CDSA, Health Canada considers a range of factors including, the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally, the overall risk to public health and safety posed by the substance, etc. In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. These survey results will not however be available until 2010.

In the interim, Health Canada has placed *Salvia divinorum* on its list of substances of concern and will continue to collect and consider information about *Salvia divinorum* and its active ingredient, salvinin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Cathy,

For your re-approval: HPFB's Natural Health Products Div proposed several changes to the responses. The most important change is that *S. divinorum* is not regulated as an NHP - it could meet the definition of an NHP when associated with health claims.

These responses have been approved by Dr. Robin Marles, Director, and Michelle Boudreau, DG, NHPD.

Diane Allan reviewed again and approved, making additional changes to Q.1. We were too late to meet the reporter's deadline of 5PM Friday. CBC will be running a story on Monday at 7:30am. However, reporter expects to be running a followup story on Salvia, so we would like to obtain approval of these lines for Monday.

Q1 - How is *Salvia divinorum* classified in Canada?

A1 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).

*Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

*Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are being sold as NHPs that are not in compliance with the NHPR, may be subject to compliance and enforcement actions.

As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products

Q2 - Is it regulated (or are there plans to regulate it)?

Christine

Cathy,

For your re-approval: HPFB's Natural Health Products Div proposed several changes to the responses. The most important change is that *S. divinorum* is not regulated as an NHP - it could meet the definition of an NHP when associated with health claims.

These responses have been approved by Dr. Robin Marles, Director, and Michelle Boudreau, DG, NHPD.

Diane Allan reviewed again and approved, making additional changes to Q.1. We were too late to meet the reporter's deadline of 5PM Friday. CBC will be running a story on Monday at 7:30am. However, reporter expects to be running a followup story on Salvia, so we would like to obtain approval of these lines for Monday.

Q1 - How is *Salvia divinorum* classified in Canada?

A1 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).

*Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

*Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are being sold as NHPs that are not in compliance with the NHPR, may be subject to compliance and enforcement actions.

As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products

Q2 - Is it regulated (or are there plans to regulate it)?

A2 - *Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the NHPR. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Health Canada continues to collect relevant information about *Salvia Divinorum* and its active

ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q3 - How much research has been done on the effects of salvia (what is known about its properties etc.)?

A3- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.

Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

~~Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.~~

~~Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.~~

Q4 - Are there concerns that anyone could access it ? (it's under glass counter at corner stores and in most head shops here in Toronto).

A4 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* and continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

Q5 - What would it take to get regulated ? (ie: kids uploading videos to You Tube of their "bad trips" on salvia).

A5 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;

- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed. Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

- CBC Radio Toronto - Salvia divinorum

Hi,  
NHPD has proposed several changes to the responses. The most important change is that *S. divinorum* is not regulated as an NHP - it could meet the definition of an NHP when associated with health claims.

These responses have been approved by Dr. Robin Marles, Director, and Michelle Boudreau, DG, NHPD.

Q1 - How is *Salvia divinorum* classified in Canada?

Q2 - Is it regulated (or are there plans to regulate it)?

A2 - *Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the NHPR. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Health Canada continues to collect relevant information about *Salvia Divinorum* and its active

ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q3 - How much research has been done on the effects of salvia (what is known about its properties etc.)?

A3- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.

Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

~~Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.~~

~~Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.~~

Q4 - Are there concerns that anyone could access it ? (it's under glass counter at corner stores and in most head shops here in Toronto).

A4 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* and continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

Q5 - What would it take to get regulated ? (ie: kids uploading videos to You Tube of their "bad trips" on salvia).

A5 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

CBC Radio Toronto - Salvia divinorum

Hello,

Here is a media enquiry for Salvia which is due at COB today. This enquiry needs to go through both HECS and HPFB approvals (Director, DG, and Sr. comms exec.) Are you able to help me get HPFB approvals this afternoon, if so can you send it to the appropriate director and DG, then back to me for my DG approval then we can send it to each of our sr comms executives. I would like to have this done by 4, as I work another job tonight. Let me know. Thanks in advance.

Approved by:

Christine Roush, Sr Comms Advisor  
Diane Allan, Director, OCS  
XX, Director, XX (pending)  
Cathy Sabiston, DG, CSTD (pending)  
XX, DG, XX (pending)  
Kathleen Malone, Sr Comms Executive (pending)  
Ken Polk, Sr Comms Executive (pending)

Another request for Salvia divinorum - this one an interview request for COB Today. reporter's questions are:

Q1 - How is Salvia divinorum classified in Canada?

A1 - *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that Salvia products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Q2 - Is it regulated (or are there plans to regulate it)?

A2 - *Salvia divinorum* meets the definition of a natural health product under the NHPR and is regulated under this set of regulations. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Q3 - How much research has been done on the effects of salvia (what is known about its properties etc.)?

A3- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.

Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian

Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q4 - Are there concerns that anyone could access it ? (it's under glass counter at corner stores and in most head shops here in Toronto).

A4 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* and continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q5 - What would it take to get regulated ? (ie: kids uploading videos to You Tube of their "bad trips" on salvia).

A5 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed. Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Hi Cheryl,

Do you think in Q4 we should reiterate that it is not controlled at the beginning?

Just a thought.

I have made a few changes below which you can choose to include or ignore. They are based on the fact that we say in the first question that Salvia is considered an NHP. Thus, it is regulated, just not under the CDSA.

Toronto - *Salvia divinorum*

Hello,

Here is media enquiry for input/approval by 2pm as this is due at COB. Below are my suggested responses, but I still need input for Q4. Thanks in advance.

Another request for *Salvia divinorum* - this one an interview request for COB Today. reporter's questions are:

Q1 - How is *Salvia divinorum* classified in Canada?

A1 - *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Q2 - Is it regulated (or are there plans to regulate it)?

A2 - *Salvia divinorum* meets the definition of a natural health product under the NHPR and is regulated under this set of regulations. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Q3 - How much research has been done on the effects of salvia (what is known about its properties etc.)?

A3- Changed the order a little...

While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.

Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q4 - Are there concerns that anyone could access it ? (it's under glass counter at corner stores and in most head shops here in Toronto).

A4 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* and continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q5 - What would it take to get regulated ? (ie: kids uploading videos to You Tube of their "bad trips" on salvia).

A5 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed. ~~Health Canada has only anecdotal information about the last three of the above mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps.~~ Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Subject For approval: Media enquiry - [REDACTED] - CMAJ - Salvia Divinorum

Hello,

Here is yet another media enquiry for your approval by COB today. Thanks.

CMAJ has an interest in Salvia divinorum, a tropical member of the Mint family. It's called a "legal high".  
It's increasingly being banned in the U.S.

Q1 - I was hoping you could get me a comment from Health Canada about Salvia. If it's being looked at. If  
it will be banned?

000393

A1 - *Salvia Divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia Divinorum*, also known as "diviner's sage", is chewed or smoked and can induce illusions and hallucinations. It is known to have psychotropic effects, which means it affects the mind and mental processes.

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

A regulatory amendment is necessary to add a substance to one of the Schedules of the Controlled Drugs and Substances Act. This process may take 12 to 18 months once the requirement to schedule a substance has been identified; however, where a substance presents grave harm to the public, extraordinary measures may be taken to control a substance in a more timely manner.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population. Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

*Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Q2 - Is it a big deal or not at all? (ie. Are there serious health concerns?)

A2 - *Salvia Divinorum*'s mechanism of action is still not fully understood. Although long-term effects have not yet been observed, *Salvia Divinorum* has been known to cause hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. There is, consequently, a potential for accidents occurring while the user is under the influence of the substance.

The plant's effects are short acting. We are not aware at this time of any cases of dependency to *Salvia Divinorum* having been reported. Nevertheless, Health Canada will continue to monitor *Salvia Divinorum*. Should evidence arise that suggests a significant risk to public health and safety, Health Canada will take action accordingly, which could include adding *Salvia Divinorum* to one of the schedules under the Controlled Drugs and Substances Act. (Yes, Health Canada, essentially through the Drug Strategy and Controlled Substances Program, has the authority to schedule *Salvia D* under the CDSA)

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you

with each use.

### **Risks of Using *Salvia divinorum***

*S. divinorum's* effects, which vary from person to person, are often described as unpleasant and may include the following: hallucinations; dysphoria (feeling unwell, uneasy or unhappy); out-of-body experiences; uncontrollable laughter; loss of consciousness; short-term memory loss; lack of physical coordination; slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as: the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); the user's mood and expectations.

Subject Re: Fw: Media enquiry - [REDACTED] - CMAJ - Salvia Divinorum [Link](#)

There is a It's Your Health article that has been going around for comments for awhile now - you should take a look at the latest draft of this and use the latest wording in it. I don't think it has been approved yet - it is one of these projects that keeps going back and forth to the various groups for approval. You may therefore need to seek approval from other areas too. I will try and locate the latest article and give you the contact persons to follow up with to obtain the very latest article. The CMAJ is a pretty big, well respected medical journal so we have to treat this inquiry with a lot of attention.

Subject Fw: Media enquiry - [REDACTED] - CMAJ - Salvia Divinorum

Hello,

I have pulled responses for this enquiry. There is lots of info so please let me know what you want taken out before I push this through approvals...also will this enquiry have to go through HPFB approvals?

CMAJ has an interest in Salvia divinorum, a tropical member of the Mint family. It's called a "legal high". It's increasingly being banned in the U.S.

Q1 - I was hoping you could get me a comment from Health Canada about Salvia. If it's being looked at. If it will be banned?

A1 - Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage", is chewed or smoked

and can induce illusions and hallucinations. It is known to have psychotropic effects, which means it affects the mind and mental processes.

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

A regulatory amendment is necessary to add a substance to one of the Schedules of the Controlled Drugs and Substances Act. This process may take 12 to 18 months once the requirement to schedule a substance has been identified; however, where a substance presents grave harm to the public, extraordinary measures may be taken to control a substance in a more timely manner.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population. Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

*Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that Salvia products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Q2 - Is it a big deal or not at all? (ie. Are there serious health concerns?)

A2 - *Salvia Divinorum*'s mechanism of action is still not fully understood. Although long-term effects have not yet been observed, *Salvia Divinorum* has been known to cause hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. There is, consequently, a potential for accidents occurring while the user is under the influence of the substance.

The plant's effects are short acting. We are not aware at this time of any cases of dependency to *Salvia Divinorum* having been reported. Nevertheless, Health Canada will continue to monitor *Salvia Divinorum*. Should evidence arise that suggests a significant risk to public health and safety, Health Canada will take action accordingly, which could include adding *Salvia Divinorum* to one of the schedules under the Controlled Drugs and Substances Act. (Yes, Health Canada, essentially through the Drug Strategy and Controlled Substances Program, has the authority to schedule *Salvia D* under the CDSA)

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

s.19(1)

**Risks of Using *Salvia divinorum***

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following: hallucinations; dysphoria (feeling unwell, uneasy or unhappy); out-of-body experiences; uncontrollable laughter; loss of consciousness; short-term memory loss; lack of physical coordination; slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as: the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); the user's mood and expectations.

Subj Media enquiry - [REDACTED] - CMAJ - Salvia Divinorum  
ect

Hi team,

CMAJ has an interest in *Salvia divinorum*, a tropical member of the Mint family. It's called a "legal high". It's increasingly being banned in the U.S.

I pulled up some old media lines that may/may not be helpful.

Reporter's Qs:

Q1 - I was hoping you could get me a comment from Health Canada about *Salvia*. If it's being looked at. If it will be banned?

Q2 - Is it a big deal or not at all? (ie. Are there serious health concerns?)

Deadline : Monday COB

\*\*\*

Thanks,  
Gary

Media lines (June 2009) [Link](#)

**Q10: What is the difference between the CADUMS and the Canadian Addiction Survey of 2004 (CAS)?**

**A10.** Selected comparisons with the results from the Canadian Addiction Survey of 2004 will be available, due to similarities in questions and methodology with CADUMS. It is important to point out, however, that data collection for the CAS took place from **December 2003 to March 2004**, while CADUMS interviews were conducted from **April 2008 to December 2008**. Hence, some of the differences in results may be due to seasonal variations (such as an increase of the use of alcohol and drugs) rather than year-to-year differences in behaviours or outcomes. In addition, unlike the CAS, the CADUMS did not examine lifetime prevalence of illicit drug use because priority was given to describing the current alcohol and illicit drug use situation in Canada. Also, unlike its predecessor, CADUMS included questions about use and abuse of pharmaceuticals and expanded the hallucinogens question to include Salvia Divinorum and magic mushrooms.

**Q16. Will there be any changes to the 2009 CADUMS?**

**A16.** CADUMS is continuing in 2009 with some revisions. In 2008, the CADUMS did not examine lifetime prevalence of illicit drug use because priority was given to describing the current alcohol and illicit drug use situation in Canada. In 2009, changes to the questionnaire will entail the inclusion of questions looking at lifetime prevalence, in addition to past 12 month, of illicit drug use. In addition, in 2009 the use of Salvia Divinorum will no longer be examined within the scope of the question on hallucinogens, but instead will be examined on its own in a new question. Other changes to the questionnaire include the addition of questions on the perceived risks of substance use as well as reasons for not using; a question examining type of drivers licence; and a question on any involvement in a motor vehicle accident/collision, regardless of alcohol or drug use.

Subject Re: For approval: Media enquiry - [REDACTED] - CMAJ - Salvia Divinorum

Hi Nicole,

Proposed changes in red...

Q1 - I was hoping you could get me a comment from Health Canada about Salvia. If it's being looked at. If it will be banned?

A1 - *Salvia Divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia Divinorum*, also known as "diviner's sage", is chewed or smoked and can in order to induce illusions and hallucinations. It is known to have its psychotropic effects, which means it affects the mind and mental processes.

~~Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, S salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.~~

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Ssalvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions. ~~*Salvia divinorum*, when associated with health claims, could~~ does however meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that Salvia products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

~~A regulatory amendment is necessary to add a substance to one of the Schedules of the *Controlled Drugs and Substances Act*. This process may take 12 to 18 months once the requirement to schedule a substance has been identified; however, where a substance presents grave harm to the public, extraordinary measures may be taken to control a substance in a more timely manner.~~

Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed. Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

~~While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population. Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.~~

~~*Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.~~

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, <sup>Salv</sup>salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q2 - Is it a big deal or not at all? (ie. Are there serious health concerns?)

A2 - Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. <sup>shakes (?)</sup>

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

~~*Salvia Divinorum's* mechanism of action is still not fully understood. Although long-term effects have not yet been observed, *Salvia Divinorum* has been known to cause hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. There is, consequently, a potential for accidents occurring while the user is under the influence of the substance.~~

~~The plant's effects are short acting. We are not aware at this time of any cases of dependency to *Salvia Divinorum* having been reported. Nevertheless, Health Canada will continue to monitor *Salvia Divinorum*. Should evidence arise that suggests a significant risk to public health and safety, Health Canada will take action accordingly, which could include adding *Salvia Divinorum* to one of the schedules under the *Controlled Drugs and Substances Act*. (Yes, Health Canada, essentially through the *Drug Strategy and Controlled Substances Program*, has the authority to schedule *Salvia D* under the *CDSA*.)~~

That being said,

Health Canada recommends that ~~you avoid using~~ the use of this substance be avoided because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect ~~you~~ an individual with each use.

### Risks of Using *Salvia divinorum*

*S. alvia divinorum's* effects, which vary from person to person, are often described as unpleasant and may include the following: hallucinations; dysphoria (i.e., feeling unwell, uneasy or unhappy); out-of-body experiences; uncontrollable laughter; loss of consciousness; short-term memory loss; lack of physical coordination; slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on ~~you~~ individuals. In addition, the effects may differ from one use to the next, depending on factors such as: the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); and the user's mood and expectations.

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, salvinin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

(Radio-Canada Toronto)

Nicole Prentice/HC-SC/GC/CA

Hello,

Christine 954-6789  
Geston

Below is yet another media enquiry on saliva for input/approval by noon if possible as this is due at 3 today.

Approved by:

HECS

Diane Allan, Director, OCS, CSTD (pending)  
Suzanne Desjardins, Director, ODARS, CSTD (Q4 only - pending)  
Cathy A. Sabiston, DG, CSTD (pending)  
Kathleen Malone, Senior Communications Executive, HECSB (pending)  
Paul Glover, HECS ADM (pending)

HPFB

Dr. Robin Marles, Director, NHPD (pending)  
Michelle Boudreau, DG, NHPD (pending)  
Ken Polk, Communications Executive, HPFB (pending)  
XX, ADM, HPFB (pending)

**Entrevue:** Le journaliste aimerait parler à un porte-parole (pré-enregistré) - mettre une voix sur les conclusions de l'étude et la position de Santé Canada.

*Ask if Jocelyn is available for interview/if program recommends doing it.*

**Échéance:** Aujourd'hui (15:00)

*Ask MRO for more time - need to coordinate with HPFB*

Q1 - Est-ce possible d'avoir une copie de l'étude? (l'étude devait se terminer à la fin mars 2009 - appel d'offre 1000096933)?

A1 - ?

Q2 - Intéressé à savoir la position de Santé Canada. Est-ce qu'on considère changer le placement/classification de ce produit dû au fait qu'il contient des caractéristiques hallucinogènes?

A2-- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

~~Under certain conditions of use, (OR Under certain conditions of use,)~~ *Salvia divinorum* does however meet(s) the definition of a natural health product under the Natural Health Product Regulations (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

~~As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.~~

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Siddika Mathani, A/ADM, HPFB ADMO

Q1 - How is *Salvia divinorum* classified in Canada?

A1 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).

*Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

*Salvia divinorum* , when associated with health claims, could meet the definition of a natural

health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are being sold as NHPs that are not in compliance with the NHPR, may be subject to compliance and enforcement actions.

As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Q2 - Is it regulated (or are there plans to regulate it)?

A2 - *Salvia divinorum* , when associated with health claims, could meet the definition of a natural health product under the NHPR. In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Health Canada continues to collect relevant information about *Salvia Divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Q3 - How much research has been done on the effects of salvia (what is known about its properties etc.)?

A3- Health Canada does not currently have statistics on its use across the Canadian population. Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Q4 - Are there concerns that anyone could access it ? (it's under glass counter at corner stores and in most head shops here in Toronto).

A4 - In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* and continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

Q5 - What would it take to get regulated ? (ie: kids uploading videos to You Tube of their "bad trips" on

s.19(1)

salvia).

A5 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed. Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Hi Jenn-Anne,  
We have received a media inquiry from \_\_\_\_\_ on Salvia Divinorum. HECS has the  
lead on the response, and NHPD has provided input, which was approved by Robin Marles and Michelle  
Boudreau. HECS ADMO has requested that we share the responses with HPFB ADMO for approval.  
The deadline is quite urgent. We would need ADMO approval by Noon today.

Thanks,

Cathy A. Sabiston, DG, CSTD

Kathleen Malone, Senior Communications Executive, HECSB

Paul Glover, HECS ADM

**Q1 - Est-ce possible d'avoir une copie de l'étude? (l'étude devait se terminer à la fin mars 2009 - appel  
d'offre 1000096933)?**

A1 - Health Canada has not conducted its own studies on *Salvia divinorum*, however the department  
continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A,  
from both national and international sources in order to determine what, if any, regulatory controls are  
needed.

**Q2 - Intéressé à savoir la position de Santé Canada. Est-ce qu'on considère changer le  
placement/classification de ce produit dû au fait qu'il contient des caractéristiques hallucinogènes?**

A2- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated  
under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United  
Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of  
the countries (including Canada) that are signatories to these conventions.

Under certain conditions of use *Salvia divinorum* may meet the definition of a "natural health product"  
(NHP) under Health Canada's *Natural Health Products Regulations* (NHPR), but no NHPs containing this

substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. Salvia products that are being sold as NHPs that are not in compliance with the NHPR, may be subject to compliance and enforcement actions.

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

**Q3 - Est-ce que Santé Canada peut élaborer sur le Salvia et ces caractéristiques?**

A3- *Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes. Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

There is no way to predict what effect this substance may have from one individual to the next. In addition, the effects may differ from one use to the next, depending on factors such as: the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); and the user's mood and expectations.

**4 - Combien de gens utilisent cette substance?**

A4. Health Canada does not currently have statistics on its use across the Canadian population.

Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. In addition, questions regarding the use of *Salvia divinorum* in the general population have also been included in the 2009 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q1 - I was hoping you could get me a comment from Health Canada about Salvia. If it's being looked at. If it will be banned?**

**A1 - *Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. *Salvia divinorum*, also known as "diviner's sage", is chewed or smoked in order to induce its psychotropic effects, which means it affects the mind and mental processes.**

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Under certain conditions of use *Salvia divinorum* may meet the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations* (NHPR), but no NHPs containing this substance have been approved for sale in Canada. This means products that contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. *Salvia* products that are being sold as NHPs that are not in compliance with the NHPR, may be subject to compliance and enforcement actions.

Health Canada considers several factors in determining whether scheduling a substance under the

*Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

**Q2 - Is it a big deal or not at all? (ie. Are there serious health concerns?)**

A2 - Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

Health Canada recommends that the use of this substance be avoided because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect an individual with each use.

#### **Risks of Using *Salvia divinorum***

There is no way to predict what effect this substance may have on individuals. In addition, the effects may differ from one use to the next, depending on factors such as: the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); and the user's mood and expectations.

Subject MEDIA REQUEST - Étude sur le Salvia (Radio-Canada Toronto)

Hello Diane and Suzanne,

The reporter has followed up again about Salvia D studies - suggested response from myself and HPFB below, for your input/approval. We want to try and make it as clear as possible that we haven't done any studies, but that we stay up-to-date on research done by others:

**Demande pour \*toute(s)\* étude(s) réalisée(s) par (ou pour) Santé Canada sur (uniquement ou dans un plus large contexte) la substance nommée Salvia Divinorum. Selon des commentaires faits par divers portes-paroles de Santé Canada aux médias, le ministère "étudie" les effets de cette substance depuis 2006... (Radio-Canada février 2008, Jason Bouzanis à la Presse Canadienne en avril 2007, Renée Bergeron au Journal de Québec en novembre 2006, etc...)**

**Comme je l'ai précisé au téléphone et dans mes courriels, je comprend que cette (ou ces) étude(s) ne sont pas nécessairement réalisée(s) \*per\* Santé Canada... mais parfois \*pour le compte\* du ministère. Dans les 2 cas, il me semble d'intérêt de partager avec le public les conclusions (et de possibles recommandations) concernant ce produit.**

A1 - Health Canada has not conducted or commissioned any ~~its own~~ studies on *Salvia divinorum*, however, the department continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinin A, from both national and

international sources in order to determine what, if any, regulatory controls are needed.

**To:** Diane Allan; Suzanne Desjardins  
**Cc:** Christine Roush; Nicole Prentice  
**Subject:** MEDIA REQUEST - Étude sur le Salvia (Radio-Canada Toronto)

Hello,

Another follow-up question from Radio Canada on Salvia:

**Q6) Quelles sont les conclusions, préliminaires ou finales, à laquelle (auxquelles) Santé Canada est parvenu au cours des 3 années pendant lesquelles des analyses et de la recherche ont été effectués par le personnel du ministre sur la *Salvia divinorum*.**

**A6) Do we have any preliminary/final conclusions? If not we could say something along the lines of this, from an enquiry on Salvia on October 2, 2009:**

Health Canada has not yet reached any conclusions on *Salvia divinorum*. Health Canada continues to collect relevant information about *Salvia Divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed. Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada is taking steps to address the lack of data regarding the use of and/or extent of abuse involving *Salvia divinorum*. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. ~~Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances has also been included in the 2008~~ [should this be 2009? yes, please see changes] ~~Canadian Alcohol and Drug Use Monitoring Survey.~~ The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Hi Cheryl,

I haven't done anything with the media lines, because I wanted to wait until Paul had signed off on the article so I would know if further changes needed to be made.

As for the article, Jay Khosla's email with responses to Paul's comments got lost for about a month, and it's now back with Paul's advisor. I'll follow-up on that the article this morning.

Thanks,

Morning Bronwyn,

Any news on what stage the media lines on Salvia are at? We provided the comments attached below on June 23rd.

Anything new on the IYH on Salvia? We responded to some of the ADMs comments on June 23rd as well. Are they going up for formal approvals together?

Reason I ask is that CBSA is asking for some info on whether HC regulates it and we would like to provide them with a few lines.

Thanks,

Subject CMAJ: Researchers fear "Magic Mint" ban could slow studies

October 13, 2009

### Researchers fear "Magic Mint" ban could slow studies

Source: Canadian Medical Association Journal (online / early release)

Salvia divinorum can beam you to Mars. It can eradicate gravity. It can show you things that will make you howl with laughter and things that will make you scream in fear. But it only does these things in your head — and only for about 15 minutes.

Millions of people have embarked on short-haul head trips after smoking Salvia divinorum, a plant from the mint family. Thousands have posted their hallucinogenic journeys on YouTube. In one video, viewed some two million times, a young woman says her mouth is falling off.

Some lawmakers believe Salvia divinorum, a.k.a. "Diviner's Sage," is dangerous. About a dozen countries have banned it, including Australia and Belgium. Selling it in parts of the United States will also earn you a fine and jail time. But it's legal in Canada. In some Canadian cities, a shop selling bonges is likely to have a cardboard sign in the window that says "Salvia sold here."

Though many politicians have the plant on their not-in-my-jurisdiction lists, there is no scientific data to suggest the plant's active ingredient, Salvinorin A, has any long-term effects. Some researchers studying the plant — which may prove useful in treating mental illness — are worried that bans may make their work more difficult. They say the herb doesn't appear to be addictive or toxic. Hospital emergency rooms aren't reporting major problems with patients suffering "bad trips" from Salvia divinorum. Nor have police made much noise about the herb.

"Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety," Health Canada spokesman Gary Holub writes in an email.

Holub notes, however, that Health Canada is attempting to learn how many Canadians are using *Salvia divinorum*. It included questions about the plant in the 2008–2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. Health Canada is also collecting data about the herb, from national and international sources, to determine if it should be regulated.

"Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult," writes Holub. "Health Canada recommends that the use of this substance be avoided because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect an individual with each use."

*Salvia divinorum* has been used by the Mazatecs in Oaxaca, Mexico, for centuries. Folk healers chew the leaves to produce mild hallucinations they believe provide spiritual guidance. In the early 1960s, Gordon Wasson, an American anthropologist, became the first person from a Western nation to take and write about the herb. In the early 1980s, a Mexican researcher isolated its active ingredient. But it wasn't until the 1990s that people began extracting that ingredient and adding it to fresh *Salvia divinorum* leaves.

These fortified leaves are what people buy, often over the Internet, and smoke in a bong or pipe. In the United States, about 1.8 million people have tried *Salvia divinorum*, according to the 2008 National Survey on Drug Use and Health. As with crack cocaine, the effects upon inhalation are almost instantaneous. And though short-lived, these effects are anything but mild.

"It is the most potent naturally occurring hallucinogen," says Dr. Bryan Roth, project director of the National Institute of Mental Health Psychoactive Drugs Screening Program. "It rivals LSD [lysergic acid diethylamide] in potency."

In 2002, Roth discovered that Salvinorin A had a different chemical structure than any other hallucinogen, natural or synthetic (PNAS 2002;99: 11934–9). He also found that it didn't activate the serotonin receptor responsible for the mind-bending effects of other hallucinogens. Because of its unique properties, Salvinorin A might be a novel compound for use in therapies for diseases that distort perception, such as schizophrenia and bipolar disorder.

"What we are hoping, when we find drugs that affect human consciousness, is to use them to make better treatments for mental illness," says Roth, a professor at the University of North Carolina in Chapel Hill.

That research might prove challenging, however, if the US Food and Drug Administration outlaws *Salvia divinorum*, which Roth says is likely. Though supportive of regulating distribution, he isn't looking forward to widespread legal barriers to accessing Salvinorin A. Such laws would not only keep the herb out of the hands of teenagers hoping to visit Jupiter on purple unicorns, but also out of the labs of scientists.

"It will make subsequent studies very difficult," says Roth. "It won't make them impossible but will make it difficult to obtain for therapeutic research." — Roger Collier, CMAJ

Subject Re: salvia 

Hi Brigitte

I can confirm that Salvia is not a controlled substance under the CDSA. That said, it is considered to be a natural health product (as defined in the *Natural Health Product Regulations*) and thus products containing salvia require approval from Health Canada (and issuance of an NPN) prior to sale. That said, as many salvia products do not come into the country labelled as natural health products but rather as consumer products like incense, etc., salvia products are still available in Canada.

In the context of a country wishing to import it for use by an Olympic delegation, I have to be honest and say that it seems odd as salvia is not, as far as I know, associated with any particular therapeutic benefit (although it has been documented to have been used as a traditional medicine many years ago). This might be a situation where it would be good to obtain some more information from the delegation in question and then perhaps consult NHPD as to whether in the situation provided, it would be subject to whatever controls HPFB is expecting with respect to NHPs coming in for use by visiting athletes during the Games (if any).

Hope this helps, and am happy to discuss further. Am copying Cheryl as she is the lead on salvia at the moment, and may have more to add.

Subject CBC-radio Vancouver - Exploring salvia divinorum - Nov 2  
2009, 7:42AM

STATION	CBC Radio 1 (Victoria)
DATE	Mon 02 Nov 2009
PROGRAM	On The Island
TIME	7:42 AM
REPORTER	Interview
HEADLINE	<b>Exploring salvia divinorum</b>
MEDIA LOG ID	20091102R-2528

CBC: What you're listening to there in the background is a YouTube recording of an older male team writing on the floor and experiencing intense hallucinations after smoking a drug called salvia divinorum. Short-lived and intense mild-altering experiences are typical with this drug. Some countries and some US states have banned the substance but not Canada. That may change soon however. According to a recent edition of the Canadian Medical Association Journal Health Canada is studying whether it should become a regulated drug. Michael Tymchuk sets out to find if salvia was available here in Victoria. He discovered it has been for sale in the past in some head shops although no one admits to selling it at the moment but Michael did meet someone who works in the counterculture industry who's tried the drug and here is his conversation with Ryan HENCHIES.

REPORTER: Salvia divinorum is the full name. Have you tried it?

RYAN HENCHIES: Yeah, two different occasions.

REPORTER: And what's it like?

HENCHIES: Difficult to describe and that's probably the most common description you'll get from people just 'cause one of the unique things about it is it reacts with the person who takes it very individually. There'll be common threads, for instance a sensation like you're, you're leaving your body, some people say they feel like they're dying.

REPORTER: Do you remember for yourself what it felt like?

HENCHIES: It felt as if I was like slipping away like being drawn into like a deep, like a cave or falling down a passageway - very much a lightness. It was frightening at first but as soon as I, as soon as I got used to it it became a very comforting kind of fascinating experience. You could classify it as a hallucination but it's more of like, it affects your imagination so you go within yourself and instead of like reacting to the colors on the wall you're drawing from your subconscious as the palate for the, for the, for what you see so images from your past, stuff that's important to you, issues that you need to overcome, stuff like that. It was very intense, it's a very short duration of time. Most experiences last about 25 to 45 minutes; mine was about a half an hour each.

REPORTER: Are you aware when you're stoned on it that you are actually stoned or does it seem like completely different reality?

HENCHIES: Very much a different reality. One of the, one of the key traits of it is that you're not very conscious of what's going on around you at all. One of the important traditions is to have a sitter, somebody who is not on the substance who is able to look after you. Generally what you want to do is like find a comfortable place to be, you know preferably on a couch or on a bed or somewhere where you're, you're already in a comfortable position and then you, you take it and it just hits you and it hits you very quickly so within 45 seconds you're under the full impact of the, of the substance. The sensations that you're experiencing totally overwhelm you which is why it's kind of a danger to people who are uninitiated because if you're not prepared it's very unexpected.

REPORTER: Now it used to be that you could buy it from a number of the head shops in Victoria and yet they all seem to now not carry it.

HENCHIES: Most of the main commercial suppliers are in the States so when you're trying to order it across the border it's always getting hell or impeded in some way so it, it becomes a bit of a hassle to bring it into the stores. That's one of the main reasons why it's become scarcer but the concern with it and the reason why a lot of places have stopped carrying it is because it's come to popularity very quickly and without proper education about it. It's mysterious, it's cool but it's not understood so...

REPORTER: And is it dangerous, I mean do people sometimes go over the deep end with it and do rash things?

HENCHIES: That's about the closest thing to dangerous like physically like you can't overdose it. The amount you'd have to take in for it to like seriously affect your body, you wouldn't be conscious long enough to take it, to take that much. The danger is is that the profoundness and the potency of the effect on your emotions and on your mind. People can sort of lose their way really

quickly so a person who's on it, if they're not prepared for it, if they're like at a party or just like hanging out with some friends or they're outside if people aren't prepared it's possible a person could behave dangerously, cause a fire or you know hurt themselves in some way. It's not like it drives you to do stupid things, you just won't be conscious of the actions that you're taking.

REPORTER: And your name again.

HENCHIES: Ryan HENCHIES.

REPORTER: Thank you very much.

HENCHIES: Thanks.

CBC: Thank you Michael.

Subject Re: Fw: Salvia D - IYH

I believe this is an old file (several months now) and the information needs to be updated. We did not have much information in terms of health impact at the time, and we don't have much more now, but while we did not have much information on the extent of use in Canada then, there are now recent data on the prevalence of salvia that were just released in the Ontario student drug use survey (6% of students reported having used it at least once, rate higher than for ecstasy) . Bruna is preparing a short article for CMAJ with more details on it .

Salvia has been identified for discussion by our Scheduling Committee.

**Cc:** Jodi Brown; Kimberly Sorfleet; Arafo Talane; Carmen Berube  
**Subject:** Salvia D - IYH

Hi Diane and Patricia,

Long trail below on this. In short, the Salvia D article is with Paul for his sign-off....he would like clarity on the following:

- **Why would we do an it's your health if we say we have insufficient evidence to regulate it? i.e Why do we have enough about the health impacts yet aren't acting to regulate?**

I've attempted to reply to some of this in my email below to Cathy....

Per my email below, can your shop touch base with comms on this, as these articles are pretty much comms-led and implemented, and let us know by next week.

Clarification in an email is fine, please attach/include from comms the final rationale/proposal (with confirmation of who signed off), and the last version of the article, as well as any formal/approved media lines on the issue.

**Deadline to DGO** - next Wednesday, December 2, noon

Kim - please note for BF.

Thanks very much,

Stephanie

Hi Cathy,  
Pasted here is what was originally provided as rationale in the proposal for the Salvia D article.....keeping in mind IYH articles are comms products. I will ask Diane's shop to touch base also with comms to confirm what final approved rationale was -- the key was the both HECSB and HPFB were both *onside* with this idea - consensus. I think Paul actually approved the proposal and rationale. Comms should be able to provide more clarity.

The purpose of the article is information, including around current HC role....the dept. receives the same media Qs over and over on this issue and an IYH would be something to point reporters to, rather than the scramble to gather replies and get approvals across HECSB and HPFB. The article is just more efficient - it's approved across the two branches good to go.

**THE ISSUE** - Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.

Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.

**HEALTH CANADA'S ROLE** - There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.

**WHY IS THIS ARTICLE NEEDED AND WHY IT'S YOUR HEALTH?**- The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.

So the note has been sitting in Paul's bilat file for months now. That said, comments remain.

Salvia Divinorum.pdf

Jay - this document raised some questions for me -> where are our standard lines around drug prevention the states in other countries section - is that normal - in an Ilt. Year health?

## Salvia divinorum

### The Issue

Reports suggest that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diyiner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

Happy to discuss. Paul 21-Jan-08

As written it seems to generate more questions than provide answers.

**Response to ADM Questions Regarding the IYH article on *Salvia Divinorum*  
November 27, 2009**

- (1) Why would we do an It's Your Health if we say we have insufficient evidence to regulate it? i.e. Why do we have enough about the health impacts yet aren't acting to regulate it?**

At the time that the Department elected to proceed with an It's Your Health (IYH) document on *Salvia divinorum* in 2008, information regarding the personal and societal health impacts associated with salvia, e.g., the potential for abuse and risk of addiction, the extent of actual abuse in Canada and elsewhere, overall risk to public health and safety, etc., was missing or anecdotal in nature.

A series of Health Products and Food Branch (HPFB) and Health Environments and Consumer Safety Branch (HECSB) DG-level discussions in 2007 and 2008 about this lack of data led to the conclusion that while the controls imposed by the *Controlled Drugs and Substances Act* (CDSA) were not warranted at this point in time (especially given the fact that CDSA scheduling assessments look at exactly these types of indicators), the Department still had some obligation to address the recurrent media interest and ongoing public/ law enforcement enquiries regarding this plant.

In discussions as to what type of measure might be appropriate, both branches agreed that an IYH article was an option because they aim to provide the general public with information about an issue and/or influence behaviour, which in this case, would be the reduced use of *Salvia divinorum* for its hallucinogenic properties.

Since the IYH article was completed and submitted for approval, *Salvia divinorum* has been identified for discussion by the Controlled Substances Scheduling Working Group, a new HECSB/ HPFB working group mandated to discuss substances/ issues pertaining to drug regulation of joint interest. In addition, recent data from the 2009 Ontario Student Drug Use and Health Survey shows that approximately 4.4% of all students (representing approx. 42,600 respondents) in 2009 reported using *Salvia divinorum* at least once in the past year. The Office of Drug and Alcohol Research and Surveillance, CSTD is currently preparing a short article on these findings for the Canadian Medical Association Journal. It may also be worth pointing out that should further information on the extent of abuse in Canada and/or regarding its health impacts or addictive potential come to light, there is nothing impeding Health Canada from moving to propose the inclusion of one of the Schedules to the CDSA in the future.

**Response to ADM Questions Regarding the IYH article on *Salvia Divinorum*  
November 27, 2009**

- (1) Why would we do an It's Your Health if we say we have insufficient evidence to regulate it? i.e. Why do we have enough about the health impacts yet aren't acting to regulate it?**

Several months have passed since the last draft of this Its Your Health article on *Salvia divinorum* was approved at the Director General level back in June 2009 and thus the information may require updating. While the preliminary findings we had at that time, in terms of the health impacts associated with *Salvia divinorum*, e.g., the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally, and the overall risk to public health and safety posed by the substance, were (and largely remain) either missing or anecdotal in nature, recent data on the prevalence of *Salvia divinorum* was just released in the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). According to the OSDUHS, approximately 4.4% of all students in 2009 reported using *Salvia divinorum* at least once in the past year, which represents about 42, 600 students in Ontario. The Office of Drug and Alcohol Research and Surveillance, CSTD is currently preparing a short article for Canadian Medical Association Journal with more details on these findings.

In light of the preliminary findings from our scheduling assessment, and the fact that the controls imposed by the *Controlled Drugs and Substances Act* (CDSA) were likely not warranted, we began to assess the effectiveness and appropriateness of a non-regulatory instrument to achieve our policy objectives. One strategy to reduce the health and safety risks associated with a substance of concern is to conduct an educational campaign that is targeted at known user groups and/or distributors. The information provided helps these individuals to make an informed decision based on the health effects of the substance and can include recommendations to mitigate its abuse and/or avoid potential risks. The publication of an IYH article was therefore contemplated to inform the general public about the issue while we continue to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, in order to determine what, if any, regulatory controls are needed. *Salvia divinorum* has also been identified for discussion by the Controlled Substances Scheduling Working Group (comprised of representatives from both HECSB and HPFB) the key body responsible for identifying and reviewing substances, with the exception of precursor chemicals, that are being considered for addition to one of the Schedules to the CDSA.

**Why would we do an *It's Your Health* if we say we have insufficient evidence to regulate it (i.e. why do we have enough information about the health impacts yet aren't acting to regulate)?**

#### INPUT 1

In light of the considerations and analysis above, it is recommended that neither *Salvia divinorum* nor its main active ingredient, salvinorin A, be scheduled under the CDSA at this time as they do not meet the established criteria for scheduling as follows:

- *S. divinorum* and salvinorin A are not structurally similar or even pharmacologically similar to other substances included in the schedules to the CDSA.
- The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* have been carried out on humans. More controlled systematic research in this area is needed.
- Effects are known to be short-lived and no long term studies of cumulative use have been conducted.
- Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety.
- Prohibition under the CDSA may add unnecessary burden to policing and justice systems.
- Imprisoning individuals using or trafficking *Salvia* may aggravate an already swelling prison system.
- Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding usage in Canada.

It is therefore recommended that educational materials be published in order to reduce the potential health and safety risks associated with this substance and its active ingredient.

#### INPUT 2

- Why IYH? Instrument choice (enterprise risk) change public behaviour before moving to prohibition; no incidence data outside of Ontario
- there are now recent data on the prevalence of salvia that were just released in the Ontario student drug use survey (~~6%~~ <sup>4.4%</sup> of students reported having used it at least once, rate higher than for ecstasy) . Bruna is preparing a short article for CMAJ with more details on it .

Subject: Salvia D - IYH

Hi Diane and Patricia,

Long trail below on this. In short, the Salvia D article is with Paul for his sign-off....he would like clarity on the following:

- Why would we do an it's your health if we say we have insufficient evidence to regulate it? i.e Why do we have enough about the health impacts yet aren't acting to regulate?

I've attempted to reply to some of this in my email below to Cathy....

Per my email below, can your shop touch base with comms on this, as these articles are pretty much comms-led and implemented, and let us know by next week.

Clarification in an email is fine, please attach/include from comms the final rationale/proposal (with confirmation of who signed off), and the last version of the article, as well as any formal/approved media lines on the issue.

**Deadline to DGO** - next Wednesday, December 2, noon

Kim - please note for BF.

Thanks very much,

Stephanie

Okay....here's the chronology of sorts.

I have the hard copy here also from my old records -- the article landed with Paul in June. He sent it to us with handwritten comments to Jay, who was acting at the time. Jay provided responses to Hayden in an email (I will send under separate cover).

Then we received here in August the hard copy of the article in PDF with Paul's comments and a cover from Paul to Cathy from Aug. in which he indicated he would like to discuss at some point, at a bilat, "not urgent."

Will leave copies of this package for both of you on your desks. This includes Jay's emails.

Paul's comments/Q's to Jay:

Jay -- this document raised some questions for me

1) where are our standard lines around drug prevention  
2) the status in other countries section - is that normal in an IYH article?  
Happy to discuss. Paul  
21-June-09  
As written, it seems to generate more questions than provide answers.

Salvia Divinorum.pdf

## **Response to ADM Questions Regarding the IYH article on *Salvia Divinorum***

### **(1) Where are our standard lines around drug prevention?**

The standard lines on drug prevention were not incorporated in this IYH because the wording of those lines is oriented around illicit drugs which are already regulated as controlled substances. They do not translate well to *Salvia divinorum* in light of the fact that neither this plant nor its active ingredient are regulated as controlled substances at this time. The preliminary findings of our scheduling assessment are that information about the different factors considered, e.g., the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally and the overall risk to public health and safety posed by the substance, is either missing or anecdotal in nature and thus, the controls imposed by the CDSA are likely not warranted. It is because of these preliminary findings that this IYH was contemplated. *Salvia Divinorum* continues to attract moderate media attention and it was thought that it would be beneficial to have information available on the internet that would better inform the general public about the issue, i.e., health effects and what they can do to safe guard their own health. In this regard, the language used in the article is focused on the fact that Health Canada does not know very much about how it acts on the brain and the body and thus does not recommend that people use it.

### **Is it normal to include information with respect to the status in other countries in an IYH article? (as written it seems to generate more questions than provide answers)**

The information regarding the status of *Salvia divinorum* and its active ingredient salvinorin A in other countries was included as it pertains to one of the factors that Health Canada considers when assessing whether to add a substance to one of the schedules to the CDSA, i.e., international requirements and trends in controlling the substance. This information could however be removed from the document without disrupting the flow of the article if there are concerns with its inclusion. The content of the article has however already been approved by HPFB and so we would need to go back to them for approval if this type of revision were to be made.

Subject IYH - Salvia D

Hi Jodi,

I spoke to Hayden about this article, and I understand that Cathy and Paul had a bilat to discuss changes. Hayden asked me to re-send you the article, and I'm also attaching the last media lines I could find - once we know what needs to be changed in the article, we'll update the lines if necessary, and send back to ADMO as a package:

Subject Re: Fw: Salvia D - IYH

History: This message has been replied to:

Thank you Cheryl, looks excellent to me.

I only have minor suggestion on your last sentence:

It may also be worth pointing out that should further information ~~like this~~ on the extent of abuse in Canada and/or regarding its health impacts or addictive potential come to light, there is nothing impeding Health Canada from moving to propose the inclusion of one of the Schedules to the CDSA in the future.

Hi Suzanne,

Further to the emails that were circulating late last week regarding the IYH on Salvia, please find attached our response to Paul's comments concerning the rationale for the development of this article for your review and comments.

## Salvia divinorum

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

for spiritual and medicinal purposes

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

to do use want to say this

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

to do use want to say this  
tradition  
medicinal!!

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is ~~that~~ that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;

- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario in 2009, 4.4% reported using *Salvia divinorum* at least once in the past year. Data like this, and that from the two national surveys which will be available in 2010, will help fill some of these information gaps and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect<sup>TM</sup> Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789
- Mail to:       Canada Vigilance Program  
                  Health Canada

AL 0701C  
Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

Subject Re: Fw: Salvia D - IYH

Hi Diane/Patricia,

Here are the documents pertaining to the IYH on Salvia. The development of this article was initiated following a series of HPFB and HECSB DG-level discussions in 2007-2008 about the lack of data regarding Salvia and the department's obligation to address ongoing media interest and public/law enforcement enquiries. Both branches agreed that an IYH article was an option because it aims to provide the general public with information about an issue and/or influence behaviour, which in this case, would be the reduced use of *Salvia divinorum* for its hallucinogenic properties.

I spoke with Lisa Mackay (IYH Project Manager) regarding who signed off on the proposal and while we did have an opportunity to provide input on the proposal itself, she mentioned that proposals for IYH articles rarely seek formal approvals. I have attached the email from Lisa Holmes (Senior Communications Advisor, PACRB) requesting the article below. I have also attached the Approval Slips for the article itself from both HECSB and HPFB. FYI the article has been approved up to ADM level at HPFB.

**Response to ADM's Questions**

Response to ADM Comments on Salvia IYH Dec 1 2009.doc

**Final Rationale/Proposal**

Proposed Article IYH Salvia-D.wpd

**Approval Slips for Article Itself (i.e. not proposal)**

Apps Slip DG&ADM HECS Salvia May2009.wpd Apps Slip DG&ADM HPFB Salvia May2009.wpd

**Media Lines**

These are the most recent media lines on Salvia provided by comms. They have not been formally approved. We provided additional comments after the discussions that came out of the drafting of the IYH but comms was holding off on imputing our comments until they knew what needed to be changed in the IYH article, so they could update the media lines as necessary and send the IYH and media lines back to ADMO as a package. I have attached our comments on the lines below as well.

Salvia ML v.7 April 2009.doc Salvia ML v.7 April 2009\_CSTD Comments re IYH.doc

**Previous Response to Paul's Comments on the IYH**

**Why would we do an *It's Your Health* if we say we have insufficient evidence to regulate it (i.e. why do we have enough information about the health impacts yet aren't acting to regulate)?**

### **INPUT 1**

In light of the considerations and analysis above, it is recommended that neither *Salvia divinorum* nor its main active ingredient, salvinorin A, be scheduled under the CDSA at this time as they do not meet the established criteria for scheduling as follows:

- *S. divinorum* and salvinorin A are not structurally similar or even pharmacologically similar to other substances included in the schedules to the CDSA.
- The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* have been carried out on humans. More controlled systematic research in this area is needed.
- Effects are known to be short-lived and no long term studies of cumulative use have been conducted.
- Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety.
- Prohibition under the CDSA may add unnecessary burden to policing and justice systems.
- Imprisoning individuals using or trafficking *Salvia* may aggravate an already swelling prison system.
- Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding usage in Canada.

It is therefore recommended that educational materials be published in order to reduce the potential health and safety risks associated with this substance and its active ingredient.

### **INPUT 2**

- Why IYH? Instrument choice (enterprise risk) change public behaviour before moving to prohibition; no incidence data outside of Ontario
- there are now recent data on the prevalence of salvia that were just released in the Ontario student drug use survey (6% of students reported having used it at least once, rate higher than for ecstasy) . Bruna is preparing a short article for CMAJ with more details on it .

## **Its Your Health Proposed Article**

It's Your Health articles answer frequently asked questions from the general public and provide health protection advice. Each IYH article is roughly 2 pages long, with a grade 8 to 10 "readability" level. The target audience is the general public, and plain language is used whenever possible. Links to detailed technical or scientific information can be provided in the "Need More Info?" section. These publications are distributed to: doctors and their clients, teachers and students, magazine editors and their subscribers, other federal and provincial departments, private firms, Health Canada and Public Health Agency of Canada employees. This publication is also posted on Health Canada and PHACs official Web sites.

**Author and Date of Proposal** - *Lisa Holmes - October 17, 2008*

**Proposed Title** - *Salvia divinorum*

**The Issue** - *Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.*

*Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.*

**Health Canada's Role** - *There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.*

**Why is this article needed and why It's Your Health ?** - *The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.*

**Are other communications products being considered, will they be used ?** - *Media lines.*

**Is there a deadline for producing the IYH article** - *While it is not part of a larger*

*announcement, it would be beneficial to have this article produced and posted as soon as possible, as there continues to be media attention and public interest on the issue.*

**Who in the department needs to provide input and who would be the lead contact ?-** *Andrew Adams, Director, Drug Analysis Services, HECS; Ranjan Bose, Manager, Marketed Biologicals, Biotechnology and Natural Health Products Bureau, Marketed Health Products Directorate, and Dr. Helmi Hussien, A/Director, Bureau of Clinical Trials and Health Sciences, Natural Health Products Directorate, HPFB.*

**Who in the department or outside of the department should approve this article?** - *Health Canada only.*

**Is there a plan for Stakeholder involvement or dissemination when article is completed?:** *No stakeholder plan - we will refer media to this article.*

DRAFT  
April 7, 2009

## **Media Lines Regulatory Control of *Salvia Divinorum***

### **Issue**

Since 2006, Health Canada has observed a steady increase in the amount of media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### **Key Messages:**

- Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

### **Supplementary Messages:**

#### ***On the classification of *Salvia divinorum*:***

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, Salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum*. Although some individual U.S. states have implemented laws restricting its use,

sale and/or distribution, *Salvia divinorum* is not federally regulated under the *Controlled Substances Act* in the United States.

- *Salvia divinorum*, when associated with health claims, could meet the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Ontario Student Drug Use and Health Survey likely will not be available until 2010.

## **Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products with *Salvia divinorum* has already been placed with Canada Border Services Agency.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in control and scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Abuse liability and addiction potential of the substance;
- Extent of actual abuse and misuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*.

Health Canada will, however, continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique. *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

DRAFT  
April 7, 2009

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

#### Key Messages:

- Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Deleted: relevant

Deleted: S

Deleted: Ontario Student

Deleted: and Health

#### Supplementary Messages:

##### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws

Deleted: S

Deleted: controlled

restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: is

- *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Deleted: , when associated with health claims, could

*If asked for specifics on when the survey data will be available:*

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey likely will not be available until 2010.

Deleted: Ontario Student

Deleted: and Health

## Questions and Answers

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: control  
Deleted: and scheduling  
Deleted: scheduled  
Deleted: A  
Deleted: liability  
Deleted: potential of  
Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Deleted: , however,

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

Subject It's Your Health re: Salvia

Hi Lisa,

The drug group here at HECS would like to have an It's Your Health article written on Salvia. How do we proceed with scheduling a meeting with one of the writers?

Darrin, I'm copying you as well since HPFB will have to take part in this meeting too.

Thanks!  
Lisa

**Subject:** Salvia D - IYH

Hi Diane and Patricia,

Long trail below on this. In short, the Salvia D article is with Paul for his sign-off....he would like clarity on the following:

- **Why would we do an it's your health if we say we have insufficient evidence to regulate it? i.e Why do we have enough about the health impacts yet aren't acting to regulate?**

I've attempted to reply to some of this in my email below to Cathy....

Per my email below, can your shop touch base with comms on this, as these articles are pretty much comms-led and implemented, and let us know by next week.

Clarification in an email is fine, please attach/include from comms the final rationale/proposal (with confirmation of who signed off), and the last version of the article, as well as any formal/approved media lines on the issue.

**Deadline to DGO** - next Wednesday, December 2, noon

Kim - please note for BF.

Thanks very much,

Stephanie

Subject Re: Salvia D

Hi Cathy,

Pasted here is what was originally provided as rationale in the proposal for the Salvia D article.....keeping in mind IYH articles are comms products. I will ask Diane's shop to touch base also with comms to confirm what final approved rationale was -- the key was the both HECSB and HPFB were both onside with this idea - consensus. I think Paul actually approved the proposal and rationale. Comms should be able to provide more clarity.

The purpose of the article is information, including around current HC role....the dept. receives the same media Qs over and over on this issue and an IYH would be something to point reporters to, rather than the scramble to gather replies and get approvals across HECSB and HPFB. The article is just more efficient - it's approved across the two branches good to go.

**THE ISSUE** - **Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.**

**Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.**

**HEALTH CANADA'S ROLE** - **There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.**

**WHY IS THIS ARTICLE NEEDED AND WHY IT'S YOUR HEALTH?**- **The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are easily understood by the vast majority of Canadians.**

Subject Re: Fw: 09-135999-128 - Action Request - REDIRECTED TO HECSB - request re: Status of Salvia (Divinorum) in Canada

Thanks Cheryl,

I only have a few comments;

~~- 2nd para: Is it really "head shops"?~~

*alternative lifestyle stores*

~~- Talking points: Health Canada is aware of some of the effects associated with the use of Salvia divinorum including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss~~

~~"... were included in the 2008-2009 Youth Smoking Survey": I would remove reference to the YSS, since data are not yet available~~

*Remark*  
~~Also, the last part refers to HC recommending that use of Salvia be avoided. Was there an advisory on it issued by HHP, or am I confusing it with BZP? In any event, where can we find that HC is recommending that use be avoided? perhaps we should refer to it more formally.~~

SUBJECT - OBJET

request re: Status of Salvia (Divinorum) in Canada

s.19(1)

REQUEST - DEMANDE (YYYY-MM-DD)

(1)Date: 2009-12-07

HECSB (Lead) with input from HPFB, if applicable:

The Minister's office has received a request from the office of [REDACTED] who is looking for a short summary and talking points on a substance called Salvia and it's status in Canada. There are active media lines (not yet approved) on this issue in MECS under 09-101970-456, perhaps some of this information can serve to respond to this request.

A constituent for [REDACTED] has some specific questions which are included below (a specific answer to each of these questions is not required, but the background and talking points should provide an overview of these concerns):

1. Do you agree with the fact that it is legal, and marijuana is not, when salvia is much worse than marijuana?
2. Do you believe the government sees this drug as an issue and will take action, or wait till something more devastating than the 17 year old boy who killed himself and wrote a note about the drug just before?
3. I read that the government will not make it illegal until health Canada takes the step to say "it's bad" ... do you think maybe there using this as an excuse?
4. Is there anything you know about Salvia that I might not know?
5. Would you bring this into a meeting, and make awareness?
6. Do you see the problem that many people see, that this drug is legal and being used to the extent that lives are being taken and it is only going to get worse?

Please provide background information and talking points on this issue, which can be shared with the MP's office, to MBU by 12:00PM on Thursday, December 10, 2009.

PLEASE ADVISE MBU IMMEDIATELY IF THIS REQUEST NEEDS TO BE REDIRECTED TO A DIFFERENT BRANCH OR IF OTHER BRANCHES NEED TO BE INVOLVED, OR IF FURTHER CLARIFICATION IS REQUIRED.

## MINISTER'S OFFICE REQUEST

**ISSUE:** [REDACTED] Office request a brief summary and talking points on *Salvia divinorum* and its status in Canada.

### BACKGROUND:

*Salvia divinorum* is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings and is usually chewed or smoked in order to induce its psychotropic effects.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act*.

### TALKING POINTS:

- Health Canada is aware of some of the effects associated with the use of *Salvia divinorum* including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

- Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:
  - International requirements and trends in regulatory status;
  - Chemical and pharmacological similarity to other substances already regulated under the CDSA;
  - Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
  - Potential for abuse and risk of addiction associated with the substance;
  - Extent of actual abuse of the substance in Canada and internationally; and
  - Overall risk to public health and safety posed by the substance.

---

- In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. More systematic research in this area is needed.
- In addition, the Department has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.
- Questions regarding the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009:
  - Among all students in 2009, 4.4% report using *Salvia divinorum* at least once in the past year;
  - Males (6.2%) are significantly more likely than females (2.3%) to use *Salvia divinorum*;
  - There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
  - There are significant regional variations, with students in the North (9.2%) most likely to use *Salvia divinorum*.
- Health Canada recommends that the use of *Salvia divinorum* be avoided because very little is known about the effects it may have on the body, including the brain. There is also no way to predict how it will affect different individuals and the effects may differ from one use to the next, depending on the potency of the product; how much is used; the purity of the product (it may be mixed with other substances); how it is taken (e.g., chewed, swallowed or smoked); and the user's mood and expectations.

Subject Re: Fw: 09-135999-128 - Action Request - REDIRECTED TO HECSB - request re: Status of Salvia (Divinorum) in Canada

History: This message has been replied to.

Yes although I am sad that we can't say more about the IYH and its content- perhaps it is better to remove. Only other option would be to get into all the stuff about salvia being an unapproved NHP but I really think it is too technical for this purpose.

Subject Re: Fw: 09-135999-128 - Action Request - REDIRECTED TO HECSB - request re: Status of Salvia (Divinorum) in Canada

Good morning Suzanne,

Thank you for your comments. As for the last point on where HC formally recommends that the use of Salvia be avoided, nothing has been published as of yet. That point stemmed from the IYH which we don't definitively know the status of at this point in time so perhaps we should remove all together?

Thanks,

Subject Re: Fw: 09-135999-128 - Action Request - REDIRECTED  
TO HECSB [REDACTED] request re: Status of Salvia  
(Divinorum) in Canada

Thanks Cheryl,

I only have a few comments;

- 2nd para : is it really "head shops" ?

- Talking points: Health Canada is aware of ~~some~~ of the effects associated with the use of *Salvia  
divinorum* including hallucinations, out-of-body experiences, unconsciousness and short-term  
memory loss

- "...were included in the 2008-2009 Youth Smoking Survey ": I would remove reference to the  
YSS, since data are not yet available

Also, the last part refers to HC recommending that sue of Salvia be avoided. Was there an  
advisory on it issued by HHP, or am I confusing it with BZP? In any event, where can we find  
that HC is recommending that use be avoided? perhaps we should refer to it more formally.

Suzanne

## MINISTER'S OFFICE REQUEST

s.19(1)

**ISSUE:** [REDACTED] Office requested information on *Salvia divinorum* and its status in Canada.

### BACKGROUND:

*Salvia divinorum* is a species of sage which belongs to the mint family. It is found in a number of formats, including seeds, extract and plant cuttings for growing purposes. Fresh or dried leaves can be chewed, swallowed or smoked to induce psychotropic effects. Liquid preparations are also available. Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and sold in alternative lifestyle stores.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g. to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act*. *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual states in the U.S. have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act*.

Questions regarding the use of *Salvia divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey. The results from this survey were published on November 18, 2009:

1. Among all students in 2009, 4.4 per cent report using *Salvia divinorum* at least once in the past year;
2. Males (6.2 per cent) are significantly more likely than females (2.3 per cent) to use *Salvia divinorum*;
3. There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6 per cent) and 12<sup>th</sup> graders (8.4 per cent); and
4. There are significant regional variations, with students in the North (9.2 per cent) most likely to use *Salvia divinorum*.

Health Canada will consider this data in its ongoing examination of 000490  
salvinorin A.

**TALKING POINTS:**

- Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* is warranted. These include:
  - International requirements and trends in regulatory status;
  - Chemical and pharmacological similarity to other substances already regulated under the *Controlled Drugs and Substances Act*;
  - Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
  - Potential for abuse and risk of addiction associated with the substance;
  - Extent of actual abuse of the substance in Canada and internationally; and,
  - Overall risk to public health and safety posed by the substance.
  
- In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. More systematic research in this area is needed.
  
- In addition, the Department has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any threat to public safety.
  
- Questions regarding the use of *Salvia divinorum* were included in the 2009 Ontario Student Drug Use and Health Survey, the results of which were published very recently.
  
- Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

Subject Re: CMAJ: Banning 'magic mint' could slow research

Yes saw this but that said it is validation of some of the great work that comes out of OCS and CSTD-  
there are several sections of the piece that are direct quotes from our media lines....  
Of note is that it would be hard to get for reasearch if banned in the US, but of course the system here is  
different in that we can issue an exemption- that is if the political will allows of course!!

Subject CMAJ: Banning 'magic mint' could slow research

November 23 2009  
**Banning 'magic mint' could slow research**  
Source: CMAJ, by Roger Collier

Salvia divinorum can beam you to Mars. It can eradicate gravity. It can show you things that will make you  
howl with laughter and things that will make you scream in fear. But it only does these things in your head  
—and only for about 15 minutes.

Millions of people have embarked on short-haul head trips after smoking Salvia divinorum, a plant from  
the mint family. Thousands have posted their hallucinogenic journeys on YouTube. In one video, viewed  
some two million times, a young woman says her mouth is falling off.

Some lawmakers believe Salvia divinorum, a.k.a. 'magic mint' or 'diviner's sage,' is dangerous. About a  
dozen countries have banned it, including Australia and Belgium. Selling it in parts of the United States will  
also earn you a fine and jail time. But it's legal in Canada. In some Canadian cities, a shop selling bongis is  
likely to have a cardboard sign in the window that says "Salvia sold here."

Though many politicians have the plant on their not-in-my-jurisdiction lists, there is no scientific data to

suggest the plant's active ingredient, Salvinorin A, has any long-term effects. Some researchers studying the plant—which may prove useful in treating mental illness—are worried that bans may make their work more difficult. They say the herb doesn't appear to be addictive or toxic. Hospital emergency rooms aren't reporting major problems with patients suffering "bad trips" from *Salvia divinorum*. Nor have police made much noise about the herb.

"Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety," Health Canada spokesman Gary Holub writes in an email.

Holub notes, however, that Health Canada is attempting to learn how many Canadians are using *Salvia divinorum*. It included questions about the plant in the 2008–2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey. Health Canada is also collecting data about the herb, from national and international sources, to determine if it should be regulated.

"Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult," writes Holub. "Health Canada recommends that the use of this substance be avoided because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect an individual with each use."

*Salvia divinorum* has been used by the Mazatecs in Oaxaca, Mexico, for centuries. Folk healers chew the leaves to produce mild hallucinations they believe provide spiritual guidance. In the early 1960s, Gordon Wasson, an American anthropologist, became the first person from a Western nation to take and write about the herb. In the early 1980s, a Mexican researcher isolated its active ingredient. But it wasn't until the 1990s that people began extracting that ingredient and adding it to fresh *Salvia divinorum* leaves.

These fortified leaves are what people buy, often over the Internet, and smoke in a bong or pipe. In the US, about 1.8 million people have tried *Salvia divinorum*, according to the 2008 National Survey on Drug Use and Health. As with crack cocaine, the effects upon inhalation are almost instantaneous and though short-lived, anything but mild.

"It is the most potent naturally occurring hallucinogen," says Dr. Bryan Roth, project director of the National Institute of Mental Health Psychoactive Drugs Screening Program. "It rivals LSD [lysergic acid diethylamide] in potency."

In 2002, Roth discovered that Salvinorin A had a different chemical structure than any other hallucinogen, natural or synthetic (PNAS 2002;99: 11934–9). He also found that it didn't activate the serotonin receptor responsible for the mind-bending effects of other hallucinogens. Because of its unique properties, Salvinorin A might be a novel compound for use in therapies for diseases that distort perception, such as schizophrenia and bipolar disorder.

"What we are hoping, when we find drugs that affect human consciousness, is to use them to make better treatments for mental illness," says Roth, a professor at the University of North Carolina in Chapel Hill.

That research might prove challenging, however, if the US Food and Drug Administration outlaws *Salvia divinorum*, which Roth says is likely. Though supportive of regulating distribution, he isn't looking forward to widespread legal barriers to accessing Salvinorin A. Such laws would not only keep the herb out of the hands of teenagers hoping to visit Jupiter on purple unicorns, but also out of the labs of scientists.

"It will make subsequent studies very difficult," says Roth. "It won't make them impossible but will make it difficult to obtain for therapeutic research."

## Salvia divinorum - Health Issues

### Diviners' Sage, Ska Pastora

Salvia divinorum is a perennial herb from Mexico, related to Common Sage. It is native to an area known as Sierra Mazatec. It has been used by the native Mazatec for an unknown amount of time. Its use was first recorded by western science in 1938 when a young anthropologist, Jean B. Johnson wrote:

Shamans, as well as other persons, use certain narcotic plants in order to find lost objects. In some cases teonanacatl is used, while in others a seed called 'semilla de la Virgen' is used. 'Hierba María' is similarly used. The Zapotecs use a plant called 'bador', the little children, and the Aztecs used narcotic plants in a similar manner.

It has also been suggested that Salvia divinorum is the *Pipiltzintzintli* of the Aztecs, although there is scant evidence for this.

The leaves of Salvia divinorum contain Salvinorin, a novel psychoactive and the most potent naturally occurring psychoactive compound yet found. It is active in doses as low as 200 mcg (micrograms).

The traditional methods of consuming Salvia divinorum (by the Mazatec) are chewing fresh leaves and imbibing an infusion/suspension of shredded or crushed leaves in cold water. Its use as a recreational drug in the United States and Europe usually involves the smoking of dried leaves or extracts of the leaves, although the practice of chewing fresh or re-hydrated leaves is also present.

### On to the Health Issues

Unfortunately, almost nothing is known about either the long-term or short-term health issues relating to Salvia divinorum. This vacuum of information can lead to some *potentially* dangerous assumptions being

made.

You may have heard an argument along these lines:

*The Mazatec have been using Salvia divinorum for ages, and it doesn't seem to harm them, so it must be safe.*

There are a few ways to answer this:

- Firstly, yes, the Mazatec have been using Salvia divinorum for a long time, but, no studies have ever been conducted on the Mazatec to discover what effects Salvia divinorum has on them. We know nothing of the long or short-term health risks relating to Mazatec Salvia divinorum use.
- Secondly, there is quite a disparity between Mazatec usage practices and Western usage practices. The effects of Salvia divinorum when chewed or imbibed rise gradually to a peak and last several hours. They have been described as 'more subtle'. Conversely, the effects of smoked Salvia divinorum (or an extract of it) begin suddenly, rise swiftly to a peak and subside again quite quickly, with lingering after-effects lasting 15-60 minutes. The rapid onset can be quite unexpected and provokes fear in some users. It should be noted that the Mazatec *never* smoke Salvia divinorum, considering it basically a sacrilege. This difference invalidates Mazatec usage patterns as a useful comparison for expected effects when Salvia leaves or extract are smoked.
- Thirdly, the significance of set and setting must be considered. The set (thoughts, mood, expectations) and setting (physical and social location) of a Mazatec user and a Western user are not comparable. The influence these elements can have on an experience are highly significant. Again, the set and setting of a Mazatec user are an invalid comparison to use when discussing effects expected from a non-Mazatec user.

You may also have heard an argument along these lines:

*There are no recorded cases of Salvia divinorum causing physical or psychological harm. So it must be safe.*

This statement is partially true. There are no cases in the scientific literature of individuals being harmed from using Salvia divinorum. However, this statement is only *provisionally* true; as nobody has yet looked into whether Salvia divinorum causes harm. In the future, we may find that Salvia divinorum can cause psychosis or cancer; at present, nobody knows.

### **So what can be said about the dangers of Salvia divinorum?**

There are a couple points about the physical effects of Salvia divinorum which can be stated with reasonable confidence.

- Salvia divinorum can sometimes affect motor co-ordination and balance. This can make it difficult to walk and perform simple tasks.

The risk posed to the user can be quite significant. Even simple tasks such as walking down stairs could be dangerous if this effect is pronounced. It goes without saying that more demanding tasks, such as driving or operating machinery really should not be performed under the influence of Salvia divinorum, as the risk posed to the user in these circumstances is great. This effect can continue well after the subjective effects have subsided (perhaps up to an hour when smoked).

- It is widely known that natural products other than tobacco can also be quite injurious to health when smoked. For example, there is much debate over whether Cannabis is itself carcinogenic when smoked. The one thing that is quite clear is that inhaling smoke of any kind is not good for your physical health. Although the effects of smoke from Salvia divinorum leaves and extracts have not been studied, it can be said with a fair amount of confidence that smoking Salvia divinorum is unlikely to be good for your lungs or general health.

What about psychological effects?

Before discussing the psychological effects Salvia divinorum may have, there is one consideration rarely touched upon when Salvia divinorum is discussed:

Many users of Salvia divinorum can act quite erratically and out of character while under the influence. It is entirely possible for a user to act in a way at odds with their usual behaviour. Although unlikely, it is possible for a user to become violent, or to perform actions which may potentially harm themselves. For this reason, the **Salvia Divinorum Research and Information Center** (the website of Daniel Siebert) recommends that dangerous objects, such as knives and guns are removed from the area before usage commences. It is also common to recommend a sitter (a sober person to watch over the user/users). Although this advice is basically sound, there is also the possibility that a user could become violent towards their sitter. Until research is conducted into the effects of Salvia divinorum, the likelihood of violent behaviour is an unknown quantity.

OK. So what about the other potential psychological effects of Salvia divinorum?

- For want of a better word, Salvia divinorum is described as an hallucinogenic or visionary plant. It provokes sometimes powerful experiences broadly comparable to other substances such as LSD, Psilocybin and DMT (although the visually 'hallucinogenic' effects of Salvia are a lot less pronounced than these substances). Any experience with a profound effect on the psyche (whether caused by psychoactive drugs or otherwise) can have a permanent effect on an individual. Strongly negative experiences can cause psychological damage. Again, the long-term effects of Salvia divinorum on the psyche have not been studied, but it can be said with a fair amount of confidence (by comparing with similar substances), that in rare cases Salvia divinorum *may* cause psychosis in some users. These may be users with pre-existing mental illness, users with no history of mental illness but a latent predisposition to psychosis, or just ordinary users who go too far one day.

It is impossible to say with confidence who may be susceptible to drug induced psychosis as the causes of this effect are not yet

clearly understood even among more well known and well used drugs such as LSD and Cannabis

Also, it is fairly well understood that the dangers posed by drugs are magnified when drugs are taken in combination. This may also be true with Salvia divinorum. Little is known about the effects of Salvia divinorum in combination with other drugs (other than anecdotal reports or first-hand experience reports available via websites such as Erowid.org). This means that any user trying out Salvia divinorum in combination with other drugs is experimenting with their own body and mind, and the potential outcomes (both physical and psychological) are far from clear.

### **In Conclusion**

Although, as has been said, little is known about the short- or long-term effects of Salvia divinorum on the body and psyche, it is important to remember that a lack of data about the dangers of Salvia do not prove it is safe. Too many websites espouse the idea that Salvia divinorum is safe when at present, so little is known about its effects, it is impossible to say either way. There is no scientific data on Western use patterns to base judgements on, and the practice has not been widely used in the West for long enough to form judgements based on large arrays of anecdotal data either.

## LETTERS TO THE EDITOR

rated, subjects who smoked persistently (those who smoked at both baseline and follow-up) had significantly higher HPA activity than subjects who did not smoke (2). In addition, adolescents who did not smoke at baseline but initiated smoking during follow-up and continued to smoke regularly had higher HPA activity (measured at baseline) compared with non-smokers. These data suggest that elevated HPA activity might serve as a vulnerability marker for both nicotine-related as well as non-nicotine-related substance use disorders.

It was not possible to examine cigarette smoking as a potential mediator/moderator of the relationship between HPA activity and the development of substance use disorder because the onset of smoking did not always precede the initiation of alcohol or drug use. Again, there was a high co-occurrence of smoking and non-nicotine substance use at both baseline and follow-up. In our article, the effect of prior substance use on the development of substance use disorder was examined. Although prior substance use had a significant influence on the development of substance use disorder, the effects of HPA activity and stressful life experiences persisted after accounting for the effect of prior substance use. We agree with Drs. Schütz and Sepehry that future investigations should include more careful assessments of nicotine use. Such studies also should examine the complex relationships among nicotine use, neurobiological markers, psychosocial factors, and clinical outcomes.

### Persistent Psychosis Associated With *Salvia Divinorum* Use

TO THE EDITOR: *Salvia divinorum* (salvia) is a sage plant that is easily obtained in the United States. Its active ingredient, Salvinorin A, is a novel and highly selective pure kappa opiate receptor agonist with rapid onset and powerful hallucinogenic properties (1). *Salvia* has become increasingly popular as a drug of abuse when smoked. No long-term negative outcomes have been reported from the use of salvia. We present a case in which salvia precipitated persistent psychosis.

"Mr. J" was a 21-year-old man with no family or personal psychiatric history or laboratory abnormalities. He was reported to have normal social interactions, behavior, and cognitive skills. He was transferred to our psychiatric

unit for acute psychosis and paranoia, which occurred shortly after smoking salvia. In transport, the patient became suspicious and attempted to jump from the vehicle. Upon presentation, he demonstrated echolalia, paranoia, flight of ideas, and psychomotor agitation. The patient remained agitated for the first 2 days of hospitalization. He attempted to barricade himself in his room. Risperidone (3 mg by mouth/three times per day) was administered, and the patient was eventually stabilized. The dosage, however, resulted in the parkinsonian features of rigidity, bradykinesia, and masked facies.

Mr. J was transferred to the chemical dependency unit for further treatment. He was stabilized, and treatment with risperidone was slowly tapered. During the taper from risperidone, the patient continued to improve and manifested better insight and logical thought processes. He participated in group therapy and interacted with peers, and the parkinsonian features subsided. One day after risperidone was withdrawn, the patient's symptoms abruptly returned. He became agitated, paranoid, and aggressive and believed he was able to project and receive thoughts. He returned to the inpatient psychiatry unit where risperidone (3 mg by mouth/twice daily) was reinstated. He was once again stabilized and transferred to the referring psychiatric facility for further treatment. At the 4-month follow-up, the patient exhibited no perceptible improvement.

To the best of our knowledge, this is the first reported case of a persistent negative outcome from the use of salvia. We suspect that our patient was genetically predisposed to schizophrenia, and salvia precipitated the clinical manifestations. This may relate to the drug's ability to influence dopamine levels in the brain and potentiate plastic changes in frontal lobe networks (3).

Previous studies have cited salvia as a potential treatment option for CNS illnesses (2). This is surprising, considering the paucity of research regarding its efficacy. Salvia's ability to increase dopamine levels in the nucleus accumbens increases its potential for dependence. Consistently, patients at our clinic who have used the drug report that its psychological effects are abrupt and frightening. Clinicians should be aware that salvia use can be associated with psychiatric illness.

## Light drugs available in free sale in Russia

14.04.2009    **Source:** [Pravda.Ru](http://pravda.ru)    **URL:** [http://english.pravda.ru/hotspots/crimes/107400-Light\\_drugs-0](http://english.pravda.ru/hotspots/crimes/107400-Light_drugs-0)

Light drugs are still available in free sale in Russia despite the official decree issued by Surgeon General Gennady Onischenko. One can purchase a blend of dry herbs in specialized shops. Dope sellers assure their customers that their products are absolutely harmless.

"The narcotic herbs were originally used in spa parlors as fragrance, but it later occurred to someone to smoke grass, and that's how it all started. One gram of weed costs 900 rubles (\$27), and this dose is enough for five adults. We have been receiving many calls lately from people who suffered from smoking these herbs. It is possible to develop an addiction to this kind of smoking. Others say that a person may start acting inadequately as a result of smoking," a specialist with the Drug Control Service of Samara, Ekaterina Kondareva said.

Russia's Surgeon General Gennady Onischenko issued a special decree to ban the sales of herbal smoke blends in the Russian Federation. The decree particularly banned the sales of blends containing such herbs as *Salvia Divinorum* and/or *Argyreia Nervosa* (Hawaiian rose) and/or *Nymphaea caerulea* (blue lotus). The blends containing the herbs are available under such names as AM-HI-CO, Dream, Spice (Gold, Diamond), Zoom, Ex-ses, Pep Spice, Yucatan Fire and some others.

The official decree has not stopped the sales of herbal smoke blends. "We have heard of the decree, but we are not going to scrap our sales, we have not received any instructions from our manager," sellers say.

# THE LEGAL STATUS OF *SALVIA DIVINORUM*

(This page was last updated on September 5, 2009)

The *Salvia divinorum* Research and Information Center  
is created and maintained by  
Daniel Siebert

## Legal Status

*Salvia divinorum* is a valuable medicinal herb. Because it produces profoundly introspective states intrinsically unsuitable for recreational use (i.e., it is not a "party drug"). It is not habit-forming, does not present a significant risk to public health or safety. Because it is a powerful consciousness-altering agent, its sale is sensible and appropriate. It is reasonable to require that vendors provide detailed safety information for responsible use. It also makes sense to limit the salvinorin A content of extracts sold in bulk. Bulk extracts should only be sold in pre-measured individual doses. It is appropriate to prohibit delivery of extracts in a manner appropriate to prohibit reckless use, such as driving a vehicle while inebriated. There are many other specific laws that can be enforced against reckless *salvia* users (e.g., laws that prohibit public intoxication, reckless driving, etc.). Legislation should only penalize irresponsible use, not all use. Punishment for possession of *Salvia divinorum* is neither useful nor humane. The idea of making *salvia* a controlled substance is absurd — after all, every species is a precious and irreplaceable part of our natural heritage. A sensible way to regulate *Salvia divinorum* in a similar manner as alcohol and tobacco. Another sensible option would be to require prescription medication, as some US states have done with cannabis. Certainly, physicians and pharmacists should be able to prescribe *salvia* to patients who might benefit from it. It should also remain available for use in research.

Decisions regarding the regulation of *Salvia divinorum* (or any substance) should always be based on scientific evidence. The evidence shows that this herb is relatively safe and non-addictive. The pharmacology of its primary active constituent, salvinorin A, is unique and shows great promise as a lead compound for the development of useful medications. Restrictive regulation would seriously impede further scientific research. For a well-reasoned, scientific perspective on the relative safety of *Salvia divinorum* and its importance in medical research, I encourage you to read the documents by Dr. Roland Griffiths and Dr. Matthew Johnson of Johns Hopkins University School of Medicine, presented as testimony opposing efforts to make *salvia* a Schedule I controlled substance in the US. I encourage you to read my open letter to lawmakers, which I have sent to legislators in several states.

Unfortunately, several countries have enacted laws that prohibit possession and/or sale of *Salvia divinorum*. In some cases, the penalties for violating these laws are quite severe. There are some countries that do not prohibit possession but do prohibit importation. The following listing describes all of the laws, regulations, and proposals regarding *Salvia divinorum* that I am currently aware of. Because of the controversial nature of vision-altering substances in general, it is probable that the legal status of *Salvia divinorum* will continue to change in the future. As changes in the legal status of *Salvia divinorum*, I encourage you to subscribe to my free email newsletter.

*divinorum* Observer. If you are aware of any attempts to prohibit *Salvia divinorum* in countries or territories, please click here to send me an email.

US States with Laws Prohibiting <i>Salvia</i>	Other Countries with Laws
<p><b>Illegal (Schedule I)</b>                      Delaware                      Florida                      Illinois                      Kansas                      Mississippi                      Missouri                      Nebraska                      North Dakota                      Ohio                      Oklahoma                      South Dakota                      Virginia</p> <p><b>Only Legal When Not Intended for Human Consumption</b>                      Louisiana                      North Carolina (beginning December 1, 2009)                      Tennessee</p> <p><b>Legal for Adults, but Illegal To Sell to Minors</b>                      California                      Maine (possession by minors also illegal)</p>	<p><b>Illegal to Possess or Sell</b>                      Australia                      Belgium                      Croatia                      Denmark                      Germany                      Italy                      Japan                      Latvia                      Lithuania                      Poland                      South Korea                      Sweden</p> <p><b>Illegal to Sell, but Legal to Possess</b>                      Spain                      Russia</p> <p><b>Treated as a Medicinal Herb that Requires Prescription</b>                      Estonia                      Finland                      Iceland                      Norway</p>

**Australia**

Australia was the first country to prohibit *Salvia divinorum* and salvinorin A. The committee responsible admitted that there is "no evidence of a major public health hazard." The ban went into effect July 2006. Australia or its territories who is considering being involved with this plant is urged to first obtain a license. Readers are urged *not* to ship *Salvia divinorum*, or products made from it, to Australia or its territories who receives the shipment could face severe criminal penalties. Please go here for more details on Australia's government and to learn what you can do to fight it.

## Drugs and Chemicals of Concern

### SALVIA DIVINORUM AND SALVINORIN A

(Street Names: Maria Pastora, Sage of the Seers, Diviner's Sage, Salvia, Sally-D, Magic Mint)

October 2009 DE

#### Introduction:

Salvia divinorum is a perennial herb in the mint family native to certain areas of the Sierr Mazateca region of Oaxaca, Mexico. The plant, which can grow to over three feet in height has large green leaves, hollow square stems and white flowers with purple calyces, can be grown successfully outside of this region. Salvia divinorum has been used by the Mazatec Indians for its ritual divination and healing. The active constituent of Salvia divinorum has been identified as salvinorin A. Currently, neither Salvia divinorum nor any of its constituents including salvinorin A, are controlled under the federal Controlled Substances Act (CSA).

#### Licit Uses:

Neither Salvia divinorum nor its active constituent salvinorin A has an approved medicinal use in the U.S.

#### Chemistry and Pharmacology:

Salvinorin A, also called Divinorin A, is believed to be the ingredient responsible for the hallucinogenic effects of Salvia divinorum. Chemically, it is a neoclerodane diterpene found primarily in the leaves, and to a lesser extent in the stems. Although several other substances have been isolated from the plant, none have been shown to be psychoactive.

In the U.S., plant material is typically either chewed or smoked. When chewed, the leaves and juice are maintained within the cheek area with absorption occurring across the lining of the oral mucosa (buccal). Effects first appear within 5 to 10 minutes. Dried leaves, as well as extract enhanced leaves purported to be enriched with salvinorin A, are also smoked. Pure salvinorin A, at a dose of 200-500 micrograms, results in effects within 30 seconds that last about 30 minutes.

A limited number of studies have reported the effects of using either plant material or salvinorin A. Psychic effects include perceptions of bright light, vivid colors and changes in sound, as well as... 000504

movements and body or object distortions. Other effects include dysphoria, uncontrolled laughter, a sense of loss of body, overlapping realities, and hallucinations (seeing objects not present). Adverse physical effects may include incoordination, dizziness, and slurred speech.

Scientific studies show that salvinorin A is a potent and selective kappa opioid receptor agonist. Other drugs that act at the kappa opioid receptor also produce hallucinogenic and dysphoria similar to that produced by salvinorin A. Salvinorin A does not activate the serotonin 2A receptor, which mediates the effects of other schedule I hallucinogens.

**Illicit Uses:**

Salvinorin A and Salvia divinorum products are abused for their ability to evoke hallucinogenic effects, which, in general, are similar to those of other scheduled hallucinogenic substances.

**User Population:**

According to the National Survey on Drug Use and Health Report (NSDUH), Use of Synthetic Hallucinogens: 2006, published by SAMHSA in February 2008, it is estimated that 1.8 million persons aged 12 or older used Salvia divinorum in their lifetime, and approximately 750,000 did so in the past year. Use was more common among young adults (18 to 25 years of age) than among older adults (>26 years of age). Young adults were 3 times more likely than older adults to have used Salvia divinorum in the past year. Use is more common among males than females according to NSDUH.

Seizures of Salvia divinorum and salvinorin A by federal, state and local law enforcement officials have increased from 1 in 2004 to 70 in 2008, according to the National Forensic Laboratory Information System (NFLIS). In the first half of 2009, 34 seizures have already been reported to forensic laboratories.

**Illicit Distribution:**

Salvia divinorum is grown domestically and imported from Mexico and Central and South America. The Internet is used for the promotion and distribution of Salvia divinorum. It is available as seeds, plant cuttings, whole plants, fresh and dried leaves, extract-enhanced leaves, and various strengths (e.g., 5x, 10x, 20x, 30x), and liquid extracts purported to contain salvinorin. These products are also sold at local shops (e.g., head shops and tobacco shops).

**Control Status:**

Salvia divinorum and salvinorin A are not currently controlled under the CSA. As of October 2009, fourteen states have enacted legislation placing regulatory controls on Salvia divinorum and/or salvinorin A. Delaware, Florida, Illinois, Kansas, North Dakota, Oklahoma, Virginia, Ohio, and Nebraska have placed Salvia divinorum and/or salvinorin A into schedule I controlled substance law. California, Louisiana, Maine, North Carolina, and Tennessee enacted legislation restricting the distribution of the plant. Legislative bills proposing regulatory controls died in Alaska, Indiana, South Carolina, Maryland, Texas, West Virginia and Georgia.

Salvinorin A and/or Salvia divinorum have been placed under regulatory controls in Australia, Belgium, Denmark, Estonia, Finland, Italy, Japan, Spain, and Sweden.

Comments and additional information are welcomed by the Drug and Chemical Evaluation Section; Fax 202-353-1263, telephone 202-307-7183 or Email ODE@usdoj.gov.

Subject Re: IYH Salvia Divinorum 

Hi again Lisa,

Do you anticipate that we would have to get HPFB to sign off if we were to include the following additional revision to the background section of the IYH on Salvia?

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years. ~~Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.~~

Subject Re: Fw: Fw: Salvia D - IYH

Good morning Diane,

Here are the proposed revisions to the IYH on *Salvia divinorum* for your review and approval. We have added the information with respect to the OSDUHS and have included Germany (March 1, 2008) and Japan (November 9, 2008) in the list of countries that have placed restrictions on Salvia. These are not new developments, the list simply gave some examples and was not intended to be exhaustive.

FYI - Suzanne has approved the following. We also spoke with Lisa Mackay (IYH coordinator) and she advised that these changes would not require HPFB sign off again.

IYH - Salvia Divinorum - June 8 2009 - HECSB Proposed Revisions - Dec 16 2009\_Clean.doc

Subject Re: Fw: Salvia D - IYH

Hi Diane/Patricia,

Here are the documents pertaining to the IYH on Salvia. The development of this article was initiated following a series of HPFB and HECSB DG-level discussions in 2007-2008 about the lack of data regarding Salvia and the department's obligation to address ongoing media interest and public/law enforcement enquiries. Both branches agreed that an IYH article was an option because it aims to provide the general public with information about an issue and/or influence behaviour, which in this case, would be the reduced use of *Salvia divinorum* for its hallucinogenic properties.

I spoke with Lisa Mackay (IYH Project Manager) regarding who signed off on the proposal and while we did have an opportunity to provide input on the proposal itself, she mentioned that proposals for IYH articles rarely seek formal approvals. I have attached the email from Lisa Holmes (Senior Communications Advisor, PACRB) requesting the article below. I have also attached the Approval Slips for the article itself from both HECSB and HPFB. FYI the article has been approved up to ADM level at HPFB.

Response to ADM's Questions

Response to ADM Comments on Salvia IYH Dec 1 2009.doc

**Final Rationale/Proposal**

Proposed Article IYH Salvia-D.wpd

**Approval Slips for Article Itself** (i.e. not proposal)

**Subject:** Salvia D - IYH

Hi Diane and Patricia,

Long trail below on this. In short, the Salvia D article is with Paul for his sign-off....he would like clarity on the following:

- **Why would we do an it's your health if we say we have insufficient evidence to regulate? i.e Why do we have enough about the health impacts yet aren't acting to regulate?**

I've attempted to reply to some of this in my email below to Cathy....

Per my email below, can your shop touch base with comms on this, as these articles are pretty much comms-led and implemented, and let us know by next week.

Clarification in an email is fine, please attach/include from comms the final rationale/proposal (with confirmation of who signed off), and the last version of the article, as well as any formal/approved media lines on the issue.

Deadline to DGO - next Wednesday, December 2, noon

Kim - please note for BF.

Thanks very much,

Stephanie

Sorfleet/HC-SC/GC/CA@HWC  
Subject Re: Salvia D 

Hi Cathy,

Pasted here is what was originally provided as rationale in the proposal for the Salvia D article.....keeping in mind IYH articles are comms products. I will ask Diane's shop to touch base also with comms to confirm what final approved rationale was -- the key was the both HECSB and HPFB were both onside with this idea - consensus. I think Paul actually approved the proposal and rationale. Comms should be able to provide more clarity.

The purpose of the article is information, including around current HC role....the dept. receives the same media Qs over and over on this issue and an IYH would be something to point reporters to, rather than the scramble to gather replies and get approvals across HECSB and HPFB. The article is just more efficient - it's approved across the two branches good to go.

**THE ISSUE - Salvia Divinorum is a species of sage which belongs to the mint family. It is found in the form of dried leaves, extract and plant cuttings. Salvia Divinorum, also known as "diviner's sage" and/or "magic mint", is chewed or smoked and can induce illusions and hallucinations.**

**Salvia Divinorum continues to attract moderate media attention. It will be beneficial to have an It's Your Health article available on the internet so that the general public can be better informed about the issue, and so that reporters can refer to this article, should they have questions about the issue.**

**HEALTH CANADA'S ROLE - There are no regulations or laws prohibiting the possession, use or sale of Salvia divinorum in Canada. While many countries across the globe have prohibited Salvia, it remains legal in Canada. Health Canada is currently exploring our options for prohibiting Salvia in Canada.**

**WHY IS THIS ARTICLE NEEDED AND WHY IT'S YOUR HEALTH?- The target audience is the general public. It's Your Health is a good vehicle to use to inform individuals about Salvia because the articles are written in plain language and are**

**easily understood by the vast majority of Canadians.**

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*S. divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario in 2009, 4.4% reported using *Salvia divinorum* at least once in the past year. Data like this, and that from the two national surveys which will be available in 2010, will help fill some of these information gaps and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789
- Mail to:  
Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9

## ***Salvia divinorum* (Redline)**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

**Deleted:** Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.¶

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

**Deleted:** the fact

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort

reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should apply the "buyer beware" principle.

Deleted: heed

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvininorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario in 2009, 4.4% reported using *Salvia divinorum* at least once in the past year. Data like this, and that from the two national surveys which will be available in 2010, will help fill some of these information gaps and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

Deleted: and

Deleted: ,

Deleted: these survey results

Deleted: The data, however, will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

Deleted: Sweden

Deleted: Spain,

Deleted: Finland and

Comment [C1]: Alphabetize?

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

### Reporting Adverse Reactions

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site

- Call toll-free at 1-866-234-2345

- Complete a Canada Vigilance Reporting Form and either:

- Fax toll-free to 1-866-678-6789

- Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C

Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

23 DEC. 2009

Dr. Ian MacDonald Gemmill  
Kingston, Frontenac and Lennox & Addington Public Health  
221 Portsmouth Avenue  
Kingston, Ontario  
K7M 1V5

Dear Dr. MacDonald Gemmill:

Thank you for your correspondence of November 26, 2009, addressed to Deputy Minister Morris Rosenberg, regarding Health Canada's position on *Salvia divinorum*. In your letter you also request information with respect to the health risks associated with this plant and its active ingredient, salvinorin A. The Deputy Minister has forwarded your letter to my office for a response.

Health Canada is aware of some of the experiences that are being reported by individuals that have experimented with the use of *Salvia divinorum*, including hallucinations, out-of-body experiences, unconsciousness and short-term memory loss.

As for Health Canada's position, the Department has not yet decided whether *Salvia divinorum* or salvinorin A warrant regulation as controlled substances. This is because information about the factors considered in contemplating whether to add a substance to one of the schedules to the *Controlled Drugs and Substances Act*, including the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally, the overall risk to public health and safety posed by the substance, etc., is either missing or anecdotal in nature. For example, very few scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult.

..2

- 2 -

In addition, the Department has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any threat to public safety.

Health Canada is taking steps to address the lack of data regarding the use and the extent of abuse involving *Salvia divinorum*. Questions regarding its use were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario in 2009, 4.4% reported using *Salvia divinorum* at least once in the past year. Data like this, and that from the two national surveys which will be available in 2010, will help fill some of these information gaps and contribute to future decisions that Health Canada may make about this plant and its active ingredient. Please visit <http://www.camh.net/Research/osdus.html> for more detailed findings from the 2009 OSDUHS.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* and to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home to determine the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum*.

Thank you for writing.

Sincerely,

Diane Allan  
Director  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate

Dear Deputy Minister:

**RE: *Salvia divinorum***

I am writing to enquire about the Health Canada position on *Salvia divinorum*, and herb common in parts of the Western hemisphere and containing a psychoactive chemical called *salvinorin A*. We have had reports of its sale in shops in this area and are aware that it has psychotropic effects.

I am writing to enquire from you about your opinion of the health risks of this plant and the chemical involved. In addition, I am writing to enquire about Health Canada's position and what action, if any, your department intends to take on this plant and chemical. Your response will assist us in deciding what action we might take locally to restrict or prevent its sale to youth in this area.

Thank you in advance for your assistance and look forward to an informative response.

Yours truly,

Ian MacDonald Gemmill, MD, CCFP, FCFP, FRCPC(C)  
Medical Officer of Health

Subject Re: salvia D docket

Yes there are pressures to move this through ADMO as Paul's approval has been pending since the Spring and HPFB signed off months ago, it would be nice to get this one up on the website and then start

using it in standard responses etc.

Re. media lines, I am copying Bronwyn so she can confirm, but last I remember, we had suggested some changes to the approved lines in order to align the text with the proposed IYH article but nothing ever got approved because ADMO wanted them to go forward for approval at the same time as the IYH and Paul had questions about the IYH over the summer. I am attaching the latest version that Comms had prepared and that we edited. I would suggest that we flag both docs to ADMO so that they get approved at the same time.

Salvia ML v.7 April 2009\_CSTD Comments re IYH.doc

Re. your proposed change, while I see what you are saying, I have to be honest and say that as we have worked with Suzanne D on the current text and HPFB has now approved it, making any more changes will now only further delay things. Your call I suppose but if the change is really a nice to have rather than a must have, I say we leave it for now.

Jocelyn

DRAFT  
April 7, 2009

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

#### Key Messages:

- Health Canada continues to collect and consider information about *Salvia divinorum* and its active ingredient, salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.
- While the media have reported that use of *Salvia divinorum* is on the rise in certain parts of the country, Health Canada does not currently have statistics on its use across the Canadian population.
- Health Canada is taking steps to address this lack of data. Questions regarding the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey. A general open-ended question about the use of other substances was also included in the 2008 Canadian Alcohol and Drug Use Monitoring Survey.

Deleted: relevant

Deleted: S

Deleted: Ontario Student

Deleted: and Health

#### Supplementary Messages:

##### *On the classification of *Salvia divinorum*:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws

Deleted: S

Deleted: controlled

restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: is

- *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

Deleted: , when associated with health claims, could

***If asked for specifics on when the survey data will be available:***

- Data from the Canadian Alcohol and Drug Use Monitoring Survey will be available in summer 2009, while the results of the Youth Smoking Survey and the Canadian Alcohol and Drug Use Monitoring Survey likely will not be available until 2010.

Deleted: Ontario Student

Deleted: and Health

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any particular threat to public safety.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in regulatory status;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: control

Deleted: and scheduling

Deleted: scheduled

Deleted: A

Deleted: liability

Deleted: potential of

Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. The survey results from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey will help fill some of the information gaps. The data, however, will not likely be available until 2010. In the interim, Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Deleted: , however,

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. While no validated data exist regarding usage in Canada, data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various "head shops" and natural food stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

Subject Fw: salvia D docket

Hi Bronwyn,

Here are the proposed revisions to the IYH and ML on Saliva. They have been approved by Diane Allan (below).

Q - Can we include a line about the IYH in the ML yet or would it be added once published?

Thanks,  
Cheryl

Subject Re: Fw: Fw: salvia D docket

This is why I didn't understand why a new docket was opened yesterday by OCS on this. Can you pls close the docket/file, and I will pull from CAthy's signature book. Bronwyn said Comms will send an entire package (media lines and IYH) for approvals to our DG and HPFB DG. As such, since its needs to get approved again, can we fix the 'clunky line' as per my original email below and have HPFB and our DG review that once finalised with comms and MLs.

Thanks...JB

## ***Salvia divinorum* (Clean) – CSTD Proposed Revisions - December 23, 2009**

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*S. divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should apply the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;

- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Further data from the two national surveys will be available in 2010. It is anticipated that such data will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789
-

Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C

Ottawa, ON K1A 0K9

To have postage pre-paid, download the [postage paid label](#) from the [MedEffect™ Canada Web site](#). The [Canada Vigilance Reporting Form](#) and the adverse reaction reporting guidelines may also be obtained via this Web site.

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

#### Key Messages:

- The Department has not yet decided whether *Salvia divinorum* or its active ingredient salvinorin A warrant regulation as controlled substances in Canada. This is because information about the factors considered in contemplating whether to add a substance to one of the schedules to the *Controlled Drugs and Substances Act*, is either missing or anecdotal in nature.
- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey. It is anticipated that the data from these surveys will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient.
- Health Canada continues to collect and consider information regarding *Salvia divinorum* and to consult with key stakeholders, including health officials in other countries, and law enforcement here at home to determine the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum*.

## Questions and Answers

### Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

Health Canada has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.

Deleted: regarding

Deleted: particular

Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Deleted: with

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: and scheduling

Deleted: scheduled

Deleted: A

Deleted: liability

Deleted: potential of

Deleted: and misuse

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. It is anticipated that the data from the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

Deleted: , however.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

The results from the 2009 Ontario Student Drug Use and Health Survey, which were published on November 18, 2009, indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

It is anticipated that the data from the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about the use of this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

**Deleted:** While no validated data exist regarding usage in Canada, d

**Comment [C2]:** Leave in?

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a “legal” alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: observed a steady increase in the amount of

#### Key Messages:

- The Department has not yet decided whether *Salvia divinorum* or its active ingredient salvinorin A warrant regulation as controlled substances in Canada. This is because information about the factors considered in contemplating whether to add a substance to one of the schedules to the *Controlled Drugs and Substances Act*, is either missing or anecdotal in nature.
- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey. It is anticipated that the data from these surveys will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient.
- Health Canada continues to collect and consider information regarding *Salvia divinorum* and to consult with key stakeholders, including health officials in other countries, and law enforcement here at home to determine the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum*.

Deleted: <#>Health Canada continues to collect relevant information about *Salvia divinorum* and its active ingredient, Salvinorin A, from both national and international sources in order to determine what, if any, regulatory controls are needed.

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

The results from the 2009 Ontario Student Drug Use and Health Survey, which were published on November 18, 2009, indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

It is anticipated that the data from the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about the use of this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year.
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age).
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year.
- Use was more common in males than females.

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

*★ natural*  
**Deleted:** While no validated data exist regarding usage in Canada, d

**Comment [C2]:** Leave in?

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

**Deleted:** *Salvia divinorum* does not appear to cause the euphoria often associated with other psychoactive drugs, so many people who try it do not repeat the experience.

DRAFT  
December 23, 2009

### Media Lines Regulatory Control of Salvia Divinorum

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### Key Messages:

- When sold for the purpose of modifying organic functions, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.
- There is currently insufficient information available to determine whether *Salvia divinorum* and its active ingredient salvinorin A should be scheduled under the *Controlled Drugs and Substances Act* to manage the potential risks associated with the use of *Salvia divinorum*.
- Health Canada continues to collect and consider information regarding *Salvia divinorum* and to consult with key stakeholders, including health officials in other countries, and law enforcement here at home to determine the most appropriate strategy to manage the risks associated with the use of *Salvia divinorum*.

#### Supplementary Messages:

##### *On the classification of Salvia divinorum:*

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have

**Comment [D1]:** HPFB to provide new bullet to clearly define the term "modifying organic functions". Should this bullet be positioned in the "Key Messages" or "Supplementary Messages" section?

**Deleted:** The Department has not yet decided whether to regulate *Salvia divinorum* or its active ingredient salvinorin A as controlled substances under the *Controlled Drugs and Substances Act* (CDSA).

**Formatted:** Font: Italic

**Formatted:** Font: Italic

**Deleted:** not enough scientific

**Formatted:** Font: Italic

**Deleted:** regulation under

**Formatted:** Font: Italic

**Deleted:** is the best option

**Formatted:** Font: Italic

**Deleted:** this substance

implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States,

- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If pressed on the lack of statistics on Salvia divinorum use in Canada:***

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey. This data will be available in 2010.
- It is anticipated that the data from these surveys will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient.

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers**

**Q1 – What are the risks of using *Salvia divinorum*?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. There is no way to predict what effect this substances may have on an individual as the effect may differ from one use to the next. The effect of using *Salvia divinorum* depends on a number of factors including the potency and purity (it may be mixed with other substances) of the product, how much is used, how it is taken (e.g., chewed, swallowed or smoked) and the user's mood and expectations. More controlled systematic research in this area is needed. Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q2 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

**Deleted:** ¶  
¶  
*Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.

**Comment [D2]:** HECSCB Office of Research and Surveillance to clarify when this data should be available.

*This answer does not respond to question*

A2 – When sold for the purpose of modifying organic functions, *Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.

Formatted: Font: Italic

Formatted: Font: Italic

Q3 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?

Deleted: Health Canada has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.¶

Deleted: 2

Deleted: 2

Deleted: 3

A3 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

Q4 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?

Deleted: 3

A4 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

Q5 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?

Deleted: 4

A5 –

Comment [D3]: The first part of the response to this questions should focus on the regulation of *Salvia divinorum* under the NHPR. HPFB to provide this material. The corresponding section in the IYH would also need to be changed to this effect.

With regard to the possible scheduling of *Salvia divinorum* under the *Controlled Drugs and Substances Act* (CDSA), Health Canada considers several factors, including;

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: 4

Deleted: -

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

**Comment [D1]:** This section re-inserted.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort

reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should apply the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

**Comment [D2]:** Revise to be in line with response to question #5 in the media lines.

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Further data from the two national surveys will be available in 2010. It is anticipated that such data will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or

salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*, ~~including its possible~~ regulation under the *Controlled Drugs and Substances Act*.

*which may include*

Formatted: Font: Italic

Deleted: .

### ~~Reporting Adverse Reactions~~

**Comment [D3]:** This section deleted. As agreed during the meeting, this section should focus instead on reporting a complaint from a retail perspective. HPFB to provide this material.

Subject IYH Salvia Divinorum

Hi Lisa,

Given the amount of time that has passed since the IYH on *Salvia Divinorum* has been in the formal approvals process we have been asked to review the content to ensure that it is as current as possible before it is approved by our ADM. I have attached the revisions that we would like to propose below. Do you anticipate that these changes would require HPFB sign off again?

IYH - Salvia divinorum - June 8 2009\_HECSB Proposed Revisions\_Dec 16 2009.wpd

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### **Risks of Using *Salvia divinorum***

*S. divinorum*’s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects

may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is the fact that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### **Minimizing Your Risk**

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should heed the "buyer beware" principle.

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### **The Legal Status of *Salvia divinorum***

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;

- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey; and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario in 2009, 4.4% reported using *Salvia divinorum* at least once in the past year. Data like this, and that from the two national surveys which will be available in 2010, ~~these survey results will help fill some of these information gaps~~ and contribute to future decisions that Health Canada may make about this plant and its active ingredient. ~~The data, however, will not likely be available until 2010.~~ See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Germany, Japan, Sweden, Italy, Spain, Finland and South Korea) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789

- Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

### **Need More Info?**

**Salvia divinorum (Redline) – CSTD Proposed Revisions - December 23, 2000**

**The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a “legal” alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner’s sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

**Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various “head shops” and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

**Deleted:** Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a “mystical” or hallucinogenic experience for spiritual purposes.

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

**Deleted:** the fact

The information regarding physical dependence or addiction to *S. divinorum* is unclear, although it appears the potential for either is low.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort

reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should apply the "buyer beware" principle.

Deleted: heed

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;
- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Further data from the two national surveys will be available in 2010. It is anticipated that such data will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

Deleted: and

Deleted: ,

Deleted: these survey results

Deleted: fill

Deleted: The data, however, will not likely be available until 2010.

#### In Other Countries

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

Deleted: Sweden  
Deleted: Spain.  
Deleted: Finland and  
Comment [C1]: Alphabetize?

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

### Reporting Adverse Reactions

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

- Report online at the MedEffect™ Canada Web site
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and either:
- Fax toll-free to 1-866-678-6789
- Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C

Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

### **Salvia Divinorum**

#### **Profile**

Salvia divinorum, also known as *S. divinorum* or Salvia, is a hallucinogenic plant native to the northeastern Sierra Mazateca mountain region of Mexico where the native Mazatecs have used it for centuries as a healing and divining tool. Though this is the only known location where this perennial herb grows naturally, Salvia is cultivated in some areas of the United States.<sup>1</sup> Salvia divinorum is not likely to be found at a local nursery although it is one among many of the cooking and medicinal herbs in the mint family. It is also one among many that share the genus name Salvia; for example, Salvia officinalis, is also known as common sage.<sup>2</sup> The psychoactive component (that which produces the hallucinogenic effects) of Salvia divinorum, Salvinorin A, is the most potent naturally occurring hallucinogen.<sup>3</sup> Currently, neither Salvia divinorum nor its active ingredient Salvinorin A are listed as controlled substances in the United States, though there are efforts to criminalize Salvia and its active ingredients and classify them as Schedule I controlled substances.<sup>4</sup> To date, Australia is the only country that has criminalized Salvia divinorum and its active ingredients.<sup>5</sup>

#### **History**

The first recorded mention of Salvia was made in 1938 by Jean B. Johnson, who heard of Mazatecs making a tea from the leaves of "hierba Maria," which induced visions in users. In 1952, Roberto G. Weitlaner, Johnson's father-in-law, reported the preparation of "yerba de Maria."<sup>6</sup> R. Gordon Wasson and Albert Hofmann acquired the first specimen of Salvia divinorum from the Mazatecs in 1962; they described it as "a less desirable substitute" for hallucinogenic mushrooms.<sup>7</sup>

It was not until August 2002 that researchers discovered that Salvia divinorum acts at the kappa opiate receptor (KOR) site, where much of human perception is regulated. This puts Salvia divinorum in a class of drugs known as KOR agonists, which are thought to play psychotherapeutic roles in perception altering diseases such as schizophrenia and Alzheimer's disease.<sup>8</sup>

#### **Back to Top**

#### **Methods of Use**

Only when enough of Salvia's highly active compound, Salvinorin A, is absorbed through the oral mucosa and into the blood stream can a psychoactive effect be produced.<sup>9</sup> There are several methods of ingesting Salvia with varying durations of hallucinogenic effects.

- Dried leaves of Salvia can be smoked like marijuana, in a bong, pipe, or as a joint, with effects lasting up to 15 minutes. Fresh leaves of Salvia can be chewed and swallowed or chewed as a quid.<sup>10</sup>
- When chewed as a quid, the leaves of Salvia produce extractions of Salvinorin A before the leaves are removed from the mouth. The extractions are absorbed through the oral mucosa and produce visual hallucinations, lasting 1 to 2 hours; the longer the herb remains in the mouth, the stronger the effect will be.<sup>11</sup>
- Salvinorin A extracts can be mixed in a drink or vaporized and inhaled
- When Salvia's leaves are crushed and the extracted Salvinorin A can be mixed with water to make a drink. Since Salvinorin A is deactivated by the gastrointestinal system before entering the blood stream this method may produce a more moderate effect than other methods.<sup>12</sup>
- Salvinorin A can also be vaporized and inhaled-Salvinorin A is heated on a piece of tin foil and the vapors are inhaled through a glass pipe.<sup>13</sup>

#### **Psychological and Physical Effects**

Recent research suggests that Salvia divinorum acts at the kappa opiate receptor (KOR) site of the brain where much of human perception is regulated.<sup>14</sup> Although the Mazatec Indians have been using this herb for centuries with no obvious ill effects, it is still unclear whether Salvia divinorum causes long-term effects on the brain or on the rest of the body. There have been no reports of health problems or hospitalizations as a result of Salvia use, few dangers related to its use have been identified, and no evidence exists that it is addictive.<sup>15</sup>

Although the dosage ingested and the method of ingestion affects the user's experience, some common effects include:

- Intense hallucinations, such as sensations of traveling through time and space, of floating or flying; sensations of twisting and spinning, heaviness or lightness of the body, and "soreness."<sup>16</sup>
- Less intense effects (that occur only when the eyes are closed) include visual hallucinations of various patterns and shapes. The hallucinogenic visions produced by this herb terminate when interrupted by noise or light.<sup>17</sup>

Physical effects include:<sup>18</sup>

- Dizziness
- Nausea
- Lack of coordination
- Slurred speech and awkward sentence patterns
- Decreased heart rate
- Chills

[Back to Top](#)

### Terminology

Many of the names used for Salvia divinorum indicate how the Mazatecs honor this herb for its healing and divination qualities; they believe it is the incarnation of the Virgin Mary. It has also been reported that visions of a woman are common during hallucinations. The genus name, Salvia, comes from the Latin word, salvare-meaning "to save," while the specific name, divinorum, means "of the seers."

### English

- Leaves (or herb) of the Shepherdess
- Leaves of Mary, the Shepherdess
- The Female
- Sage of the Seers
- Magic Mint
- Diviner's Mint
- Diviner's Sage

### Spanish

- Hojas de la Pastora
- Hojas de Maria Pastora
- La hembra
- Hierba (yerba) Maria
- La Maria

### Mazatec

- Ska Pastora
- Ska Maria Pastora

Hayden,

See responses in the string below.

Essentially, the answer to question #1 is not considered a controlled substance. Regarding question #2, info was provided for context and can be removed; however, we would have to "negotiate" w HPFB as this is their product.

Let us know if you need anything further

Subject Re: Paul's comment on Salvia IYH 

Jay,

Cheryl and I have come up with a response to Paul's questions and Diane has approved the following. Please advise if you would like us to make any changes.

Jocelyn

**Re. the issue of not including standard lines around drug prevention**

The standard lines on drug prevention were not incorporated in this IYH because the wording of those lines is oriented around illicit drugs which are already regulated as controlled substances. They do not translate well to *Salvia divinorum* in light of the fact that neither this plant nor its active ingredient are regulated as controlled substances at this time. The preliminary findings of our scheduling assessment are that information about the different factors considered, e.g., the potential for abuse and risk of addiction associated with the substance, the extent of actual abuse of the substance in Canada and internationally and the overall risk to public health and safety posed by the substance, is either missing or anecdotal in nature and thus, the controls imposed by the CDSA are likely not warranted. It is because of these

preliminary findings that this IYH was contemplated. *Salvia Divinorum* continues to attract moderate media attention and it was thought that it would be beneficial to have information available on the internet that would better inform the general public about the issue, i.e., health effects and what they can do to safe guard their own health. In this regard, the language used in the article is focused on the fact that Health Canada does not know very much about how *Salvia* acts on the brain and the body and thus we do not recommend that people use it.

**Re. the inclusion of information regarding he status in other countries**

The information regarding the status of *Salvia divinorum* and its active ingredient salvinorin A in other countries was included as it pertains to one of the factors that Health Canada considers when assessing whether to add a substance to one of the schedules to the CDSA, i.e., international requirements and trends in controlling the substance. This information could however be removed from the document without disrupting the flow of the article if there are concerns with its inclusion. We would however likely have to go back to HPFB if we make this type of change, as the content of the article has already been approved in that Branch.

Subject Re: Paul's comment on *Salvia* IYH 

Thanks. Based on this, I think a plainly worded explanation on why standard text is not being used would be helpful so let's tackle it from that perspective. Also, a few lines addressing other questions and a comment on the issue of approvals should assist in putting it to rest.

Clid you please craft a response to this effect for Diane's review and we'll go from there.

Thanks much.

Subject Re: Paul's comment on Salvia IYH 

We can look at the wording but I am not sure the standard lines on drug prevention really work here because they are really oriented around illicit drugs (which are regulated as controlled substances) and the whole point of doing this IYH is that salvia is not yet regulated as a controlled substance and the preliminary findings of our scheduling assessment are that it does not warrant these types of controls. Hence the language about not knowing very much about how it acts on the brain and the body, and that we don't recommend that people use it.....

Cheryl (analyst responsible) is away today but we will get something back to DGO as soon as possible. That said, if Paul really wants changes, we are going to have to go all the way back through approvals in HPFB as this IYH has been a co-production if you will, and it is my understanding from Comms that Meena has already signed off.

## Salvia divinorum

### The Issue

Reports suggest that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes.

The leaves of this plant have been used traditionally by the Mazatec Indians in Mexico for many years. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

As written it seems to generate more questions than provide answers.

## **Filmés en train d'inhaler une drogue légale YOUTUBE -- ADOS**

---

ROUYN -- (Agence QMI) L'expérience est troublante. Une vidéo montre un groupe d'adolescents en train de consommer de la drogue dans une ruelle de Rouyn-Noranda. Plus troublante encore est la révélation voulant que cette substance, visiblement très puissante, soit tout à fait légale.

Sur le site YouTube, on peut présentement voir dans une vidéo de deux minutes des jeunes en train d'inhaler de la salvia divinorum, une herbe aux propriétés hallucinogènes s'apparentant à la sauge. La majeure partie de la vidéo s'at-tarde sur deux très jeunes adolescents complètement

euphoriques.

L'un d'eux est si intoxiqué qu'il n'arrive même pas à formuler une phrase complète et se contente de rire béatement, étant lui-même étonné de l'intensité de ce qu'il vit.

Légal au Canada

Si la vidéo est choquante, surtout en raison du très jeune âge de certains participants, sachez que personne n'y enfreint pas la loi. "Aucune disposition n'existe actuellement dans le Code criminel à l'égard de cette substance ", reconnaît Marie-Josée Ouellet, responsable des communications à la Sûreté du Québec. En cas d'arrestation, aucune accusation criminelle ne pourra donc être portée contre les consommateurs.

Selon le site Internet d'information sur les drogues Erowid.org, cette substance est pourtant contrôlée ou illégale dans certains pays : Allemagne, Australie, Belgique, Chili, Corée du Sud, Danemark, Finlande, Italie, Japon, Russie et Suède. Elle est aussi interdite aux États-Unis, mais pas dans tous les États.

Effets intenses

Les effets de la salvia sont pourtant intenses. "Cela se compare au LSD. Les effets sont cependant très brefs, durant rarement plus de cinq minutes. Et souvent, l'expérience s'apparente plus à un bad trip ", indique Joëlle Thouin, coordonnatrice du Centre Normand à Rouyn-Noranda.

D'ailleurs, à la Commission scolaire de Rouyn-Noranda (CSRN), en dépit de son statut légal, la salvia divinorum est considérée comme toutes les autres drogues.

"Si un élève se présente sous l'influence de la salvia ou qu'il y a échange entre élèves, les dispositions relatives à la drogue s'appliquent et on avertit ses parents", fait savoir Julie Roy, responsable des communications à la CSRN.

Il est possible de se procurer de la salvia dans certains commerces spécialisés de la région. Un des vendeurs reconnaît toutefois que la substance n'est pas très populaire.

"On n'a pas vraiment de consommateurs réguliers. Les gens l'essaient plus une fois par curiosité et ne recommencent pas. C'est souvent désagréable. J'ai même entendu parler d'un ou deux cas de gens qui prenaient régulièrement autre chose et qui ont carrément arrêté après avoir essayé la salvia parce que le buzz leur avait fait trop peur", mentionne-t-il.

## «C'est comme faire bouillir son cerveau au micro-ondes»

Journal La Frontière de Rouyn-Noranda

Raphael (nom fictif) a déjà consommé de la salvia divinorum à plusieurs reprises. Selon lui, il faut être extrêmement vigilant avec cette drogue, car elle peut produire une expérience qui altère la conscience.

«Une bouffée et tu pars complètement sur une autre planète, avertit-il. On perd entièrement le contact avec le monde extérieur. Par exemple, une fois j'ai eu le fixe sur une table et je me suis senti devenir la table.»

Les effets de la salvia sont relativement courts. Très rarement les hallucinations durent plus de cinq minutes. En revanche, celles-ci frappent le consommateur environ 30 secondes après inhalation de la fumée.

«Les effets sont nombreux. Chaque personne peut réagir de façon très différente et parfois, l'expérience peut être très douloureuse. On perd le contrôle complètement, on a des visions et nos sens se décuplent. C'est comme si on faisait bouillir son cerveau au micro-ondes», mentionne Raphael.

Ce dernier affirme avoir tenté l'expérience de la salvia après s'être renseigné. Selon lui, les amérindiens de l'Amérique latine auraient été les premiers consommateurs de cette plante lors de rituels religieux et c'est ce côté qui l'intriguait.

Beaucoup de précautions

«Je déconseille définitivement de consommer de la salvia. Les effets, quoique courts, sont trop puissants. Pour ma part, je ne compte plus en consommer, avoue-t-il.

Pourtant, c'est une drogue très facile à trouver et vraiment peu chère, entre 20 \$ et 40 \$ le gramme. Avec cette quantité, on peut facilement en avoir assez pour dix personnes.

Selon Raphael, il faut être très prudent lorsqu'on consomme de la salvia. «On reste chez soi, tranquille, et il doit y avoir quelqu'un avec soi qui reste sobre pour éviter que l'on tombe inconscient, ce qui est très dangereux. Ce que font les jeunes du video est totalement irresponsable», s'indigne-t-il.

Subject Global National - Salvia being used among young students in  
small Quebec town - Jan 9/10 5:50 PM

Global National

Sat Jan 9 2010

5:50 PM

**Salvia being used among young students in small Quebec town**

Carolyn: IT'S CALLED MAGIC MINT, LADY "D" OR SALVIA. NO MATTER WHAT YOU CALL IT, EFFECTS ARE THE SAME. INTENSE HALLUCINATIONS. THERE ARE CONCERNS TEENS ARE GETTING THEIR HANDS ON IT AND PUTTING THEIR SAFETY AT RISK. DOMINIC FAZIOLI HAS MORE.

Dominic: THERE'S A NEW VIDEO BRINGING ATENSION TO AN OLD CONTROVERSY. A GROUP OF YOUNG STUDENTS SMOKING DRUGS IN A SMALL TOWN IN QUEBEC. THEY ARE HALLUCINATE ING AND UNCONSCIOUS. IT HAS A LESS TO DO WITH THE AGE OF THE CHILDREN THAN THE DRUG THEY'RE ON. IT'S CALLED SALVIA. IN CANADA YOU CAN BUY IT AND USE IT LEGALLY.

REALLY POPULAR FOR YOUNGER KIDS -- WELL, 18 TO 23.

Reporter: --

Dominic: SALVIA IS A BIG SELLER IN THIS DOWNTOWN SHOP. JENNY ROY SAYS MORE AND MORE TEENAGERS ARE FINDING OUT ABOUT THE DRUG.

IN A WEEK I CAN SELL ABOUT AT LEAST 50, 50 LITTLE VIALS A WEEK.

Dominic: VIALS START AT ABOUT \$25. USERS EXPERIENCE A HALLUCINOGENIC FEELING. THIS STUDENT SAYS SALVIA IS PLANT-BASED IS ONE OF THE REASONS MANY OF HIS 23RE7BDS HAVE TRIED IT.

BETTER THAT'S MY OPINION. BUT THIS IS NATURAL.

Dominic: SALVIA IS ILLEGAL IN OTHER PARTS OF THE WORLD. IN THE U.S. IT'S LABELLED AS A DRUG OF CONCERN. \*\*>HEALTH CANADA<\*\* HAS RULED IT TO BE NON-TOXIC AND NON-ADDICTIVE. OTHER PROFESSIONALS HAVE SERIOUS CONCERNS.

HIGH DOSE SOMEONE COULD HAVE TOO INTENSE OF AN EXPERIENCE AND HAVE A PANIC ATTACK AND END UP IN AN EMERGENCY ROOM OR END UP DOING SOMETHING, WALKING OUT INTO TRAFFIC OR SOMETHING LIKE THAT.

Dominic: HE SAYS THE ISSUE IS NOT LEGALITY BUT YOU INFORMING PARENTS WHAT THEIR RESPONSIBILITIES ARE.

THERE IS A LACK OF UNDERSTANDING BECAUSE THEY ARE NOT FULLY DEVELOPED PSYCHOLOGICALLY, EMOTIONALLY. THERE'S A LACK OF UNDERSTANDING OF WHAT BOUNDARIES ARE. OKAY. IF IT'S LEGAL, THERE'S NOTHING WRONG WITH IT.

Dominic: AT HIGH TIMES THEY TRY TO SET BOUNDARIES. YOU HAVE TO BE 18 YEARS OLD TO PURCHASE IT. BECAUSE IT'S ILLEGAL, TEENS CAN EASILY GET THEIR HANDS ON THE DRUG. DOMINIC FAZIOLI, GLOBAL NEWS, MONTREAL.

Subject Salvia Divinorum

Hi Isabelle,

My colleague Denis Arsenault indicated to me that you were looking for information on Health Canada's position on and activities regarding *Salvia divinorum*. I trust that the following information will be helpful.

As you may be aware, *Salvia divinorum* is a species of sage which belongs to the mint family. It is found in a number of formats, including seeds, extract and plant cuttings for growing purposes. Fresh or dried leaves can be chewed, swallowed or smoked to induce psychotropic effects. Liquid preparations are also available. Products that claim to contain *S. divinorum* - or its main active ingredient, salvinorin A - are widely available on the Internet and sold in alternative lifestyle stores.

In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act*. *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.

Internationally, several countries (Australia, Belgium, Denmark, Sweden, Italy, Spain, Finland and South Korea) have however placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual states in the U.S. have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not regulated under the federal *Controlled Substances Act*.

For its part, Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* warranted. These include:

- international requirements and trends in regulatory status;
- chemical and pharmacological similarity to other substances already regulated under the *Controlled Drugs and Substances Act*,
- legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- potential for abuse and risk of addiction associated with the substance;
- extent of actual abuse of the substance in Canada and internationally; and,
- overall risk to public health and safety posed by the substance.

In the case of *Salvia divinorum*, information about these factors is either missing or anecdotal in nature. For example, very few scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. More systematic research in this area is needed. It should also be noted that, thus far, the Department has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any threat to public safety.

Thank you,

Subject La Frontière (online) - Salvia: Lemay impuissant

2010-01-13 08:58 AM

Mardi le 12 janvier

**Salvia: Lemay impuissant**

Source: La Frontière

([lafrontiere.canoe.ca/webapp/sitepages/content.asp?contentid=124893&id=288](http://lafrontiere.canoe.ca/webapp/sitepages/content.asp?contentid=124893&id=288))

À la suite d'un reportage, révélé en primeur sur le site Internet de La Frontière, où l'on voit de jeunes adolescents consommer, en toute légalité, une drogue appelé salvia divinorum, le député fédéral, Marc Lemay a affirmé que cette substance ne devrait pas être bannie, du moins à court terme.

Rappelons que la salvia est une drogue aux effets intenses, qui provoque de puissantes hallucinations sur une très courte période. Officiellement, cette substance n'est pas illégale car elle ne causerait pas de dépendance, malgré ses effets comparable à ceux du LSD.

En vente libre dans certains commerces spécialisés, ici même en région, la salvia est toutefois considérée illégale dans de nombreux pays européens et états américains.

M. Lemay a avoué avoir appris l'existence de la salvia dans nos pages. «Je n'ai jamais eu de demande à ce sujet. Si quelqu'un venait me voir à propos de la salvia et souhaitait faire de la pression pour rendre cette drogue illégale, je lui conseillerais d'écrire au ministre de la Santé afin d'avoir davantage de précisions», indique-t-il.

#### Décision de Santé Canada

La procédure pour rendre une substance illégale passe moins par les parlementaires que par une recommandation du ministère de la Santé au ministère de la Justice, qui l'intègre ensuite au Code criminel.

«À terme, c'est au ministère de la Santé de prendre une décision à savoir si une substance doit, ou non, être considérée comme substance illicite. Le ministère de la Justice doit ensuite faire un règlement qui entre dans l'annexe des drogues, et donc, dans le Code criminel, sans avoir à passer par la Chambre, fait savoir l'avocat de formation.

C'est comme pour les substances dopantes, si l'Agence mondiale antidopage place un produit sur sa liste de produits interdits, automatiquement celui-ci est interdit au Canada, sans procédures supplémentaires.»

[DD/MM/2009]

### 2. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health

Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, in order to determine whether or not *S. divinorum*, and/or salvinorin A, should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

A 2006 National Survey on Drug Use and Health Report, published in February 2008 by the Substance Abuse and Mental Health Administration in the United States, also estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* in their lifetime, with approximately 750,000 having done so in the past year;
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (> 26 years of age);
- Young adults were nearly three times more likely than youths, aged 12 to 17, to have used *Salvia divinorum* in the past year; and
- Use was more common in males than in females.

---

1 U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: *Salvia Divinorum* (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

2 Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June, 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk, defined as "A situation in which there is a reasonable probability that the use of, or exposure to, a product, will cause moderate or mild adverse health consequences.

Further to an ADM discussion in April 2007, DSCSD organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) on May 16, 2007 to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFB as a Type II substance. MHPD was to send the HRA and SA to DCSCD, look into preparing an adverse reaction case presentation in the ADR Newsletter, and explore the possibility of developing a product advisory. HPFBI was to determine compliance activities based on the HRA Type II classification and check with Canada Border Services Agency (CBSA) to determine if any further information regarding *S. divinorum* shipments was available. The Office of Research and Surveillance, DSCSD was to continue to work on the *S. divinorum* Fact Sheet and explore the feasibility of a health food/natural food store survey on *S. divinorum*. OCS was to gather information from Australia regarding its scheduling decision and to find out whether the DEA had any plans to schedule *S. divinorum* in the near future.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what is known about *S. divinorum* from a regulatory perspective and to reach consensus on next steps.

The following action items came out of this meeting:

- (1) DSCSD to submit a response to the MHPD/NHPD analytical documents and MHPD/NHPD to make changes accordingly;
- (2) DSCSD to finalize the latest version of the media lines on *S. divinorum* and put them forward, via Communications, for approval in HPFB;
- (3) DSCSD to find out the status of draft fact sheet that was being developed by its Office

of Research and Surveillance;

(4) HPFBI to discuss the potential allocation of additional resources, e.g., additional inspectors, etc. to the *S. divinorum* file; and

(5) DSCSD to explore the notion of scheduling, i.e., carry out a preliminary scheduling assessment, as part of a mid to long-term action plan.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinorum* and to determine an agreed upon approach for subsequent steps.

The following action items came out of that meeting:

(1) Review and provide comments on *S. divinorum* IAS and SA and revise and re-issue IAS and SA, as needed;

(2) circulate draft Fact Sheet for comment and explore the possibility of developing a public-friendly communication;

(3) prepare draft media lines for *S. divinorum* and circulate for comment;

(4) contact DAS labs for any information on *S. divinorum*;

(5) prepare project charter for *S. divinorum* working group;

(6) contact Public Health Agency Canada (PHAC) for representation;

(7) continue work on scheduling assessment for *S. divinorum*; and

(8) continue sharing information relating to *S. divinorum* as it arises.

#### **4.1 Legislative Frameworks for Drug Control in Canada**

##### **4.1.1 Food and Drug Regulations**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in

(a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,

(b) restoring, correcting or modifying organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

##### **4.1.2 Natural Health Product Regulations**

The *Natural Health Products Regulations* (NHPR) came into force in January, 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a product identification number preceded by the prefix NPN, or, in the case of a homeopathic medicine, by the letters DIN-HM on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein, is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold.

#### **4.1.3 *Controlled Drugs and Substances Act and its Regulations***

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule to the CDSA is should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in Control/Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

#### ***Australia***

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision. Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>3</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances.

#### ***Denmark***

Shortly after, in 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

#### ***Germany***

---

<sup>3</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum*, and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale i.e., that beyond medical treatment or research purposes, will be subject to up to five years imprisonment or to a fine of up to five million yen.

### ***Spain***

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other alleged “toxic” herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

In Estonia, Finland, Iceland and Norway *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of October 2009, fourteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Nebraska, North Dakota, Ohio, Oklahoma, and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina and Tennessee have enacted other forms of legislation restricting the distribution of the plant. Legislative bills proposing regulatory controls died in Alabama, Alaska, Georgia, Indiana, Maryland, South Carolina, Texas and West Virginia.

### ***California***

For example, effective January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009. The new law came into effect on December 1, 2009.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not however a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a

retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implication.

#### 4.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>4</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>5</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>6</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by LSD or PCP.<sup>7</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>8</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>9</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>10</sup> In addition, while the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an

unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>11</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>12</sup>

#### 4.2.3 Legitimate Uses of Salvia *Divinorum*

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>13</sup>

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>14</sup> where an infusion of the leaves or ingestion of the leaves is used to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>15</sup> Its main use is however for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>16</sup>

#### 4.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>17</sup> because activation of the MORs causes euphoria, which makes the user want to take them. As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>18</sup> In addition, KOR

agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression, however, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>19</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration by which it is taken. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. Onset of effect generally takes 5-10 minutes which build over the next hour and last for another hour before the effects begin to subside.<sup>21</sup>

Routes that avoid the hepatic first-pass effect are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500µg of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effect felt from vaporizing salvinorin A powder is about 30 seconds and effects last for about 5-10 minutes and subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A and/or a concentrated extract can also be

used sublingually. *S. divinorum* nor salvinorin A are not injected because the powder is insoluble in water.<sup>25</sup>

Although the various modes of administration lead to variable onset and duration of the effects, the effects of *S. divinorum* are generally accepted to be: becoming objects, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>26</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>27</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering however have also been reported.<sup>28</sup>

The aversive effects of previously studied KOR agonists would predict that the risk of addiction to *S. divinorum* is negligible, however, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out and, therefore, using these studies to predict its potential for addiction and abuse is difficult. In addition, in the studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the reward and aversive effects are also warranted.

Another aspect of *S. divinorum*'s abuse potential stems from its availability. As previously mentioned it is widely available for purchase on the Internet through drug promotional sites and is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling the drug quite affordable and attractive. Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 µg had profound hallucinogenic effects.<sup>29</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, even poor yields of a gram per kilograms of dried leaves would provide a dose for 2000 human

doses.<sup>30</sup> This easy isolation makes buying the drug quite affordable. *S. divinorum* leaves sell for \$0.50-7 per gram, plants for \$20-45 and the liquid extract for \$4-10 per millilitre.<sup>31</sup>

#### 4.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the actual population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% report using *Salvia divinorum* at least once in the past year;
- Males (6.2%) are significantly more likely than females (2.3%) to use *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in the North (9.2%) most likely to use *Salvia divinorum*.

Further data from the two national surveys, i.e., the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in 2010.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the CDSO druglist, it is not possible to have records of any seizures of it in the database.

<sup>1</sup> NFLIS reported items of salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – September data in 2008.

Two reports regarding the abuse of *S. divinorum* have been published in the academic literature. The first was an international case report in which a young man (19 years of age) described his perceptions after inhaling the smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves.<sup>32</sup> The second case involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of *Salvia* use.<sup>33</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for unknown period

<sup>32</sup> **Error! Main Document Only.** Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>33</sup> **Error! Main Document Only.** Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

of time.<sup>34</sup> It should be noted that alcohol and general depression were the main confounders in this case. This case did, however, result in the state of Delaware passing a law outlawing *S. divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>35</sup>, however, this aversion to the drug is not an effect being echoed in other studies and reports.<sup>36</sup> Moreover, over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said they would probably or definitely use *S. divinorum* again.<sup>37</sup> Therefore, despite the fact that users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>38</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>39</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug,<sup>40</sup> it is difficult to determine the influence these effects have on the use of *S. divinorum*.

#### 4.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen may be on the rise in Canada. It is, however, premature to make this assumption as Health Canada presently does not have any viable statistics on the actual population use of *S. divinorum* across the Canadian population.

The potential for harm to the user and/or other individuals may be increased as users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, distinction between self and surroundings is lost, and at doses greater than 1mg of salvinorin A,

s.21(1)(a)  
s.21(1)(b)

out of body experiences are frequent and loss of consciousness has been reported.<sup>41</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also not received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like all drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>42</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use of *S. divinorum* in Canada and the risk of abuse and/or risk that *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *S. divinorum*.

## 5. ASSESSMENT OF RISKS AND BENEFITS (OPTIONAL)

<sup>41</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly though, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>48</sup>

The following points should be considered:

- Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen.

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

s.21(1)(a)

s.21(1)(b)

- Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada.

*Salvia divinorum* meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that product's that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, it is difficult to ascertain how much *S. divinorum* is currently sold or consumed in Canada at the present time. Several challenges also arise with respect to the importation and domestic movement of such products as they are often declared as incense and therefore cannot be considered non-market natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling clearly indicates that the product is to be used for consumption and/or pharmacological effects (ie. statements regarding contraindications or restrictions on use) upon which the product will no longer meet the definition of a consumer product (i.e. incense) and will meet the definition of a NHP. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above.

- It is also hard to know because we have no way of tracking or counting

#### 2. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health

Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, in order to determine whether or not *S. divinorum*, and/or salvinorin A, should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

A 2006 National Survey on Drug Use and Health Report, published in February 2008 by the Substance Abuse and Mental Health Administration in the United States, also estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* in their lifetime, with approximately 750,000 having done so in the past year;
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (> 26 years of age);
- Young adults were nearly three times more likely than youths, aged 12 to 17, to have used *Salvia divinorum* in the past year; and
- Use was more common in males than in females.

1 U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

some have  
no effect  
> (AD)?  
others  
causities?

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June, 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk, defined as "A situation in which there is a reasonable probability that the use of, or exposure to, a product, will cause moderate or mild adverse health consequences.

should have a description of what this means (regulation)

Further to an ADM discussion in April 2007, DSCSD organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) on May 16, 2007 to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFB as a Type II substance. MHPD was to send the HRA and SA to DCSCD, look into preparing an adverse reaction case presentation in the ADR Newsletter, and explore the possibility of developing a product advisory. HPFBI was to determine compliance activities based on the HRA Type II classification and check with Canada Border Services Agency (CBSA) to determine if any further information regarding *S. divinorum* shipments was available. The Office of Research and Surveillance, DSCSD was to continue to work on the *S. divinorum* Fact Sheet and explore the feasibility of a health food/natural food store survey on *S. divinorum*. OCS was to gather information from Australia regarding its scheduling decision and to find out whether the DEA had any plans to schedule *S. divinorum* in the near future.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what is known about *S. divinorum* from a regulatory perspective and to reach consensus on next steps.

The following action items came out of this meeting:

- (1) DSCSD to submit a response to the MHPD/NHPD analytical documents and MHPD/NHPD to make changes accordingly;
- (2) DSCSD to finalize the latest version of the media lines on *S. divinorum* and put them forward, via Communications, for approval in HPFB;
- (3) DSCSD to find out the status of draft fact sheet that was being developed by its Office

of Research and Surveillance;

(4) HPFBI to discuss the potential allocation of additional resources, e.g., additional inspectors, etc. to the *S. divinatorum* file; and

scheduling assessment →

(5) DSCSD to explore the notion of scheduling, i.e., carry out a preliminary scheduling assessment, as part of a mid to long-term action plan.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinatorum* and to determine an agreed upon approach for subsequent steps.

The following action items came out of that meeting:

- (1) Review and provide comments on *S. divinatorum* IAS and SA and revise and re-issue IAS and SA, as needed;
- (2) circulate draft Fact Sheet for comment and explore the possibility of developing a public-friendly communication;
- (3) prepare draft media lines for *S. divinatorum* and circulate for comment;
- (4) contact DAS labs for any information on *S. divinatorum*;
- (5) prepare project charter for *S. divinatorum* working group;
- (6) contact Public Health Agency Canada (PHAC) for representation;
- (7) continue work on scheduling assessment for *S. divinatorum*; and
- (8) continue sharing information relating to *S. divinatorum* as it arises.

#### 4.1 **Legislative Frameworks for Drug Control in Canada**

##### 4.1.1 Food and Drug Regulations → under FDA

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoring, correcting or modifying organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

##### 4.1.2 Natural Health Product Regulations (under FDA)

→ 11-11-13  
100 TDA

The *Natural Health Products Regulations* (NHPR) came into force in January, 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a product identification number preceded by the prefix NPN, or, in the case of a homeopathic medicine, by the letters DIN-HM on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein, is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule to the CDSA is should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

#### 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

##### 4.2.1 International Requirements and Trends in Control/Scheduling

are they looking at it?  
with a memo?  
NO :\$

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

##### *Australia*

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision. Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>3</sup>

examples

##### *Belgium*

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances.

no info of which class? NO. which includes hallucinogenic mushrooms, khat and peyote cactus.

##### *Denmark*

Shortly after, in 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

##### *Germany*

<sup>3</sup> [http://www.cognitivefreedom.org/news/salvia\\_australia.htm](http://www.cognitivefreedom.org/news/salvia_australia.htm)

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum*, and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella I" of the *Tabelle Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale i.e., that beyond medical treatment or research purposes, will be subject to up to five years imprisonment or to a fine of up to five million yen.

### **Spain**

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other alleged "toxic" herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

In Estonia, Finland, Iceland and Norway *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of October 2009, fourteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Nebraska, North Dakota, Ohio, Oklahoma, and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina and Tennessee have enacted other forms of legislation restricting the distribution of the plant. Legislative bills proposing regulatory controls died in Alabama, Alaska, Georgia, Indiana, Maryland, South Carolina, Texas and West Virginia.

### **California**

For example, effective January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009. The new law came into effect on December 1, 2009.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not however a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a

retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implication.

#### 4.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>4</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>5</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>6</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by LSD or PCP.<sup>7</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>8</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>9</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>10</sup> In addition, while the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an

<sup>9</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

<sup>10</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6 and González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>11</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>12</sup>

#### 4.2.3 Legitimate Uses of Salvia Divinorum

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>13</sup>

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>14</sup> where an infusion of the leaves or ingestion of the leaves is used to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>15</sup> Its main use is however for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>16</sup>

#### 4.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>17</sup> because activation of the MORs causes euphoria, which makes the user want to take them. As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>18</sup> In addition, KOR

agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression, however, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>19</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration by which it is taken. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. Onset of effect generally takes 5-10 minutes which build over the next hour and last for another hour before the effects begin to subside.<sup>21</sup>

Routes that avoid the hepatic first-pass effect are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500µg of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effect felt from vaporizing salvinorin A powder is about 30 seconds and effects last for about 5-10 minutes and subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A and/or a concentrated extract can also be

Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

used sublingually. *S. divinorum* nor salvinorin A are not injected because the powder is insoluble in water.<sup>25</sup>

Although the various modes of administration lead to variable onset and duration of the effects, the effects of *S. divinorum* are generally accepted to be: becoming objects, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>26</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>27</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering however have also been reported.<sup>28</sup>

The aversive effects of previously studied KOR agonists would predict that the risk of addiction to *S. divinorum* is negligible, however, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out and, therefore, using these studies to predict its potential for addiction and abuse is difficult. In addition, in the studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the reward and aversive effects are also warranted.

Another aspect of *S. divinorum*'s abuse potential stems from its availability. As previously mentioned it is widely available for purchase on the Internet through drug promotional sites and is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling the drug quite affordable and attractive. Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 µg had profound hallucinogenic effects.<sup>29</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, even poor yields of a gram per kilograms of dried leaves would provide a dose for 2000 human

doses.<sup>30</sup> This easy isolation makes buying the drug quite affordable. *S. divinorum* leaves sell for \$0.50-7 per gram, plants for \$20-45 and the liquid extract for \$4-10 per millilitre.<sup>31</sup>

↳ what is the [?] of Salvia [?]

#### 4.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the actual population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% report using *Salvia divinorum* at least once in the past year;
- Males (6.2%) are significantly more likely than females (2.3%) to use *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in the North (9.2%) most likely to use *Salvia divinorum*.

↳ any explanation why this regional variation?

Further data from the two national surveys, i.e., the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in 2010.

↳ when? do we

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

have those?

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the CDSO druglist, it is not possible to have records of any seizures of it in the database.

can we get those?

↳ ? table next page!

and compare to other drugs also?

<sup>1</sup> NFLIS reported items of salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – September data in 2008.

Two reports regarding the abuse of *S. divinorum* have been published in the academic literature. The first was an international case report in which a young man (19 years of age) described his perceptions after inhaling the smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves.<sup>32</sup> The second case involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of *Salvia* use.<sup>33</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for unknown period

<sup>32</sup> **Error! Main Document Only.** Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>33</sup> **Error! Main Document Only.** Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

of time.<sup>34</sup> It should be noted that alcohol and general depression were the main confounders in this case. This case did, however, result in the state of Delaware passing a law outlawing *S. divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>35</sup>, however, this aversion to the drug is not an effect being echoed in other studies and reports.<sup>36</sup> Moreover, over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said they would probably or definitely use *S. divinorum* again.<sup>37</sup> Therefore, despite the fact that users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>38</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>39</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug,<sup>40</sup> it is difficult to determine the influence these effects have on the use of *S. divinorum*.

#### 4.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen may be on the rise in Canada. It is, however, premature to make this assumption as Health Canada presently does not have any viable statistics on the actual population use of *S. divinorum* across the Canadian population.

The potential for harm to the user and/or other individuals may be increased as users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, distinction between self and surroundings is lost, and at doses greater than 1mg of salvinorin A,

s.21(1)(a)

s.21(1)(b)

out of body experiences are frequent and loss of consciousness has been reported.<sup>41</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also not received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like all drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>42</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use of *S. divinorum* in Canada and the risk of abuse and/or risk that *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *S. divinorum*.

## 5. ASSESSMENT OF RISKS AND BENEFITS (OPTIONAL)

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

## 7. CONSIDERATIONS

s.21(1)(a) *S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use.  
s.21(1)(b) Young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly though, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>48</sup>

The following points should be considered:

- Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen.

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

So the negs work only for products intended to be marketed for human use. if labelled - increase when they basically fall outside the NHPR's

- Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada.

So it's controlled but not really implementable

what does this mean

*Salvia divinorum* meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that product's that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, it is difficult to ascertain how much *S. divinorum* is currently sold or consumed in Canada at the present time. Several challenges also arise with respect to the importation and domestic movement of such products as they are often declared as incense and therefore cannot be considered non-market natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling clearly indicates that the product is to be used for consumption and/or pharmacological effects (ie. statements regarding contraindications or restrictions on use) upon which the product will no longer meet the definition of a consumer product (i.e. incense) and will meet the definition of a NHP. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above.

( - It is also hard to know because we have no way of tracking or counting ] what

### 2. ISSUE

*regulated* In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health

Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules <sup>of</sup> to the CDSA, in order to determine whether or not *S. divinorum*, and/or salvinorin A, should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

A 2006 National Survey on Drug Use and Health Report, published in February 2008 by the Substance Abuse and Mental Health Administration in the United States, also estimated that:

- 1.8 million persons aged 12 or older <sup>have</sup> used *Salvia divinorum* in their lifetime, with approximately 750,000 having done so in the past year;
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (> 26 years of age);
- Young adults were nearly three times more likely than youths, aged 12 to 17, to have used *Salvia divinorum* in the past year; and
- Use was more common in males than in females.

not needed.

1 U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

2 Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

too detailed.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

↳ ADHD?

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June, 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk, defined as "A situation in which there is a reasonable probability that the use of, or exposure to, a product, will cause moderate or mild adverse health consequences."

what is this?

Drug Strategy & Controlled Substances Directorate.

Further to an ADM discussion in April 2007, (DSCSD) organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) on May 16, 2007 to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFB as a Type II substance. MHPD was to send the HRA and SA to DCSCD, look into preparing an adverse reaction case presentation in the ADR Newsletter, and explore the possibility of developing a product advisory. HPFBI was to determine compliance activities based on the HRA Type II classification and check with Canada Border Services Agency (CBSA) to determine if any further information regarding *S. divinorum* shipments was available. The Office of Research and Surveillance, DSCSD was to continue to work on the *S. divinorum* Fact Sheet and explore the feasibility of a health food/natural food store survey on *S. divinorum*. OCS was to gather information from Australia regarding its scheduling decision and to find out whether the DEA had any plans to schedule *S. divinorum* in the near future.

On September 13, 2007, a meeting was organized between DSCSD, MHPD, NHPD and HPFBI to discuss what is known about *S. divinorum* from a regulatory perspective and to reach consensus on next steps. It was determined that DSCSD would conduct a scheduling assessment of *S. d.* to explore the possibility of scheduling this substance under the CDSA.

The following action items came out of this meeting:

- (1) DSCSD to submit a response to the MHPD/NHPD analytical documents and MHPD/NHPD to make changes accordingly;
- (2) DSCSD to finalize the latest version of the media lines on *S. divinorum* and put them forward, via Communications, for approval in HPFB;
- (3) DSCSD to find out the status of draft fact sheet that was being developed by its Office

the

of Research and Surveillance;

(4) HPFBI to discuss the potential allocation of additional resources, e.g., additional inspectors, etc. to the *S. divinatorum* file; and

(5) DSCSD to explore the notion of scheduling, i.e., carry out a preliminary scheduling assessment, as part of a mid-to long-term action plan.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinatorum* and to determine an agreed upon approach for subsequent steps.

The following action items came out of that meeting:

(1) Review and provide comments on *S. divinatorum* IAS and SA and revise and re-issue IAS and SA, as needed;

(2) circulate draft Fact Sheet for comment and explore the possibility of developing a public-friendly communication;

(3) prepare draft media lines for *S. divinatorum* and circulate for comment;

(4) contact DAS labs for any information on *S. divinatorum*;

(5) prepare project charter for *S. divinatorum* working group;

(6) contact Public Health Agency Canada (PHAC) for representation;

(7) continue work on scheduling assessment for *S. divinatorum*; and

(8) continue sharing information relating to *S. divinatorum* as it arises.

#### 4.1 Legislative Frameworks for Drug Control in Canada

##### 4.1.1 Food and Drug Regulations

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in

(a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,

(b) restoring, correcting or modifying organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

##### 4.1.2 Natural Health Product Regulations

14H?

Salvia?

The *Natural Health Products Regulations* (NHPR) came into force in January 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a product identification number preceded by the prefix NPN, or, in the case of a homeopathic medicine, by the letters DIN-HM on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

Salvia?  
↓

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold.

#### 4.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule <sup>of</sup> the CDSA <sup>it</sup> should be placed, Health Canada considers the following factors:

of it

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in Control/Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

#### ***Australia***

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision. Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>3</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances.

#### ***Denmark***

Shortly after, in 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

#### ***Germany***

---

<sup>3</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum*, and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale i.e., that beyond medical treatment or research purposes, will be subject to up to five years imprisonment or to a fine of up to five million yen.

### ***Spain***

On January 28, 2004, the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other alleged "toxic" herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

In Estonia, Finland, Iceland and Norway *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of October 2009, fourteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Nebraska, North Dakota, Ohio, Oklahoma, and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina and Tennessee have enacted other forms of legislation restricting the distribution of the plant. Legislative bills proposing regulatory controls died in Alabama, Alaska, Georgia, Indiana, Maryland, South Carolina, Texas and West Virginia.

### ***California***

as of  
For example, effective January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### **Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated similarly to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009. The new law came into effect on December 1, 2009.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not however a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a

retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implication.

#### 4.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>4</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>5</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>6</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by LSD or PCP.<sup>7</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>8</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>9</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>10</sup> In addition, ~~while~~ the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an

unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>11</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>12</sup>

#### 4.2.3 Legitimate Uses of *Salvia Divinorum*

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

→ potential as antipsychotic & psych drug? Sheffler & Roth, 2003

→ Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>13</sup>

→ potential as addiction treatment (Prisinzano 2005)

→ 1/4 known selective kappa agonist

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>14</sup> where an infusion of the leaves or ingestion of the leaves is used to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>15</sup> Its main use is however for its psychoactive properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>16</sup>

→ the leaves themselves are ingested to

#### 4.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>17</sup> because activation of the MORs causes euphoria, which makes the user want to take them.<sup>18</sup> As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR); and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>18</sup> In addition, KOR

agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression, however, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>19</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration by which it is taken. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. Onset of effect generally takes 5-10 minutes, which build over the next hour and last for another hour before the effects begin to subside.<sup>21</sup>

Routes that avoid the hepatic first-pass effect are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500µg of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effect felt from vaporizing salvinorin A powder is about 30 seconds and effects last for about 5-10 minutes and subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A and/or a concentrated extract can also be

Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

used sublingually. <sup>Neither</sup> *S. divinorum* nor salvinorin A are ~~not~~ injected because the powder is insoluble in water.<sup>25</sup>

However, Although the various modes of administration lead to variable onset and duration of the effects, <sup>of S.d.</sup> the effects of *S. divinorum* are generally accepted to be: <sup>inhalation of an</sup> becoming objects, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>26</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>27</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering ~~however~~ have also been reported.<sup>28</sup>

The aversive effects of previously studied KOR agonists would predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and, therefore, using these studies to predict its potential for addiction and abuse is difficult. In addition, in the studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the reward and aversive effects are also warranted.

Another aspect of <sup>the</sup> *S. divinorum*'s abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling the drug quite affordable and attractive. Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 µg had profound hallucinogenic effects.<sup>29</sup> The extraction of salvinorin A from the plant is very easy and, ~~with care~~, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, even poor yields of a gram per kilograms of dried leaves would provide ~~a dose~~ <sup>enough</sup> for 2000 human ~~doses~~ Salvinorin A

#### 4.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the actual population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% report using *Salvia divinorum* at least once in the past year;
- Males (6.2%) are significantly more likely than females (2.3%) to use *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in the North (9.2%) most likely to use *Salvia divinorum*.

Further data from the two national surveys, i.e., the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in 2010.

→ now available.

the spring/summer of

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the CDSO druglist, it is not possible to have records of any seizures of it in the database.

<sup>1</sup> NFLIS reported items of salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – September data in 2008.

Two reports regarding the abuse of *S. divinorum* have been published in the academic literature. The first was an international case report in which a young man (19 years of age) described his perceptions after inhaling the smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves.<sup>32</sup> The second case involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of Salvia use.<sup>33</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for unknown period

<sup>32</sup> Error! Main Document Only. Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>33</sup> Error! Main Document Only. Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

of time.<sup>34</sup> It should be noted that alcohol and general depression were the main confounders in this case. This case did, however, result in the state of Delaware passing a law outlawing *S. divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>35</sup> However, this aversion to the drug is not an effect being echoed in other studies and reports.<sup>36</sup> Moreover, over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said they would probably or definitely use *S. divinorum* again.<sup>37</sup> ~~Therefore, despite the fact that users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>38</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>39</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug,~~ it is difficult to determine the influence these effects have on the use of *S. divinorum*.

However,

#### 4.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in the number of enquiries from various municipalities and members of the public and ~~by~~ the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen ~~may be~~ on the rise in Canada. It is, however, premature to make this assumption as Health Canada presently does not have any viable statistics on the actual ~~population~~ use of *S. divinorum* across the Canadian population.

The potential for harm to the user and/or other individuals may be increased as users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, distinction between self and surroundings is lost, and at doses greater than 1mg of salvinorin A,

- long-term effects  
- other effects  
- lack of data pertains to toxicity

however, this assumption may be premature

- lack of data re: social behavior & activities such as driving

out of body experiences are frequent and loss of consciousness has been reported.<sup>41</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also ~~not~~ received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like ~~all~~ drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>42</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use of *S. divinorum* in Canada and the risk of abuse and/or risk that *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *S. divinorum*.

## 5. ASSESSMENT OF RISKS AND BENEFITS (~~OPTIONAL~~)

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

s.21(1)(a)  
s.21(1)(b)

8.1. CONSIDERATIONS

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly though, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>48</sup>

The following points should be considered:

- Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen.

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

s.21(1)(a)

s.21(1)(b)

- Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada.

*Salvia divinorum* meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that product's that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, it is difficult to ascertain how much *S. divinorum* is currently sold or consumed in Canada at the present time. Several challenges also arise with respect to the importation and domestic movement of such products as they are often declared as incense and therefore cannot be considered non-market natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling clearly indicates that the product is to be used for consumption and/or pharmacological effects (ie. statements regarding contraindications or restrictions on use) upon which the product will no longer meet the definition of a consumer product (i.e. incense) and will meet the definition of a NHP. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above.

→ - It is also hard to know because we have no way of tracking or counting

REPORTER Mary-Catherine McIntosh  
HEADLINE **Concerns over controls on salvia**  
MEDIA LOG ID 20100312R-1407

JUDY ALDOUS (Announcer): The man who killed Arcelie Laoagan says he was high on drugs and alcohol at the time. While testifying in his own defense this week, Christopher Watcheston said he had smoked salvia. It's a psychoactive plant, that's perfectly legal in Canada. With more on what this drug is, I'm joined in the studio by CBC Reporter Mary-Catherine McIntosh. Good morning.

MARY-CATHERINE MCINTOSH (Reporter): Good morning.

ALDOUS: So what is salvia?

MCINTOSH: Salvia is a green leafy plant, that's hallucinogenic. Um historically, it was used by healers in Mexico, as a tool for meditation and spirituality. Um it's also been used in the past to heal arthritis, headaches, and diarrhea. But today in Canada, it's mostly used as a recreational drug. And the high, or the hallucination period, uh typically lasts for just 2 to 5 minutes. And there are tons of videos on Youtube to um, that are called things like Hailey gets high on salvia. And uh, here's one, just to give you an idea about what I'm talking about.

UNIDENTIFIED PERSON: [unintelligible laughter or crying]

MCINTOSH: So, so in this video, a young woman sitting on a bed, and I don't know if she's laughing or crying, but it does not look fun. At times she kind of looks like she's choking. And uh, she holds out her arms and then looks at them as if they don't belong to her. And it's clear in the video there are friends watching her, or having a lot more fun than she is. Um this video's pretty typical for so many that are online. But for the drug, people who defend it, say that it's mostly an aid in meditation.

ALDOUS: So where do you find this drug, salvia?

MCINTOSH: At head shops. They're those shops that sell um, marijuana things, like bongos and rolling papers, and lighters. And I visited a couple, and that's where I met uh, Vlassis Duvas. Now again he runs one of these shops. Uh, it smells like tobacco, and incense, and there are bongos that run almost the entire length of the store. And he says he'd never try the stuff. He never has, and he never wants to because it sort of scares him. But he does sell 1 gram baggies of the, of salvia. And it looks like dried up tea. And he sells it in different strengths, and they sell for about \$30. He said he sells mostly to young adults, and um, here's part of our conversation.

MCINTOSH: What do you say to people when they come in, and say they'd like to buy it?

VLASSIS DUVAS (store owner): I would say I'll sell it to you. If they ask me my opinion, I'd point blank say hey, I haven't tried the stuff and never will. It's your choice, I'll give you the info that I have, and I usually try to keep all my customers safe, not just the ones that buy this one.

MCINTOSH: Do you give them a little warning?

DUVAS: Yes, I do.

MCINTOSH: What do you say?

DUVAS: I usually say, uh if you do it, do it in the company of someone else that will not do it. Take turns. Don't do it all together and hope that that's going to work. It is not a party drug. It is a personal thing.

MCINTOSH: So neither shop I visited sell that much of this stuff. Uh Duvas says that he sells just a couple grams a day.

ALDOUS: So you said that the high from salvia can be intense. What makes it different from so many illegal drugs?

MCINTOSH: That's a hard one to answer. Uh, I went to the greenhouse at the University of Calgary that actually, that actually grows these plants, and I spoke with researcher Dae-Kyun Ro, he said it's the gene sequence of salvia. And I asked him and just a note in this answer, uh salvinorin A is the active component of salvia.

DAE-KYUN RO (University of Calgary researcher): I'm not 100% sure why certain substances actually legal, and certain, salvinorin A is legal. It, was, uh, why some substances illegal, and salvinorin A is legal. I don't know exactly the reason why, but I suspect is that, um, salvinorin A is less addictive. And the um, the effect of salvinorin A is very quick, so less than, two to five minutes. So

even though it's a very potent compound, um, the effect is very short and it's less addictive.

MCINTOSH: So he says the drug's less addictive and the high is really short. But there's no real scientific reason, why it's legal and others aren't.

ALDOUS: So what does Health Canada say about this?

MCINTOSH: Well it's not studying salvia, and it never has. Basically, the department has a set of criteria, uh for controlling substances, and they include things like international requirements, chemical and pharmacological similarity to other substances that are controlled and regulated. Legitimate uses of the substance, potential for abuse, um, risk of addiction, overall risk to public health. And basically salvia doesn't meet those criteria. Uh but one interesting thing that um, the department also said was that the um, that there's not a lot know about the plant. And that's something that was backed up by Dr. Ro. He said just in the last five years, scientists have discovered that unlike some other drugs like LSD, salvia binds to one single receptor in the brain. And that makes it possible for some day down the line, for salvia to be adopted, and for things to be added to it, and for it to be used as a mood altering drug for things like depression.

ALDOUS: Huh. So, for, for good uses.

MCINTOSH: Yes, potentially.

ALDOUS: Thank you very much Mary-Catherine.

MCINTOSH: You're welcome.

ALDOUS: That's Mary-Catherine McIntosh, she is a reporter with CBC Radio here.

\*\*\* END OF STORY \*\*\*

Media Monitoring Unit / Unité de surveillance des médias  
Health Canada / Santé Canada

DRAFT  
December 23, 2009

**Media Lines  
Regulatory Control of Salvia Divinorum**

**Issue**

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

**Key Messages:**

When r... .., <sup>Salvia</sup> ~~any~~ products are subject to NHPR

- ~~The Department has not yet decided whether to regulate *Salvia divinorum* or its active ingredient salvinorin A as controlled substances under the *Controlled Drugs and Substances Act (CDSA)*.~~
- ~~There is currently not enough scientific information available to determine whether regulation under the CDSA is the best option to manage the potential risks associated with the use of *Salvia divinorum*.~~ <sup>Reg. of *Salvia divinorum* and its active ingredient as controlled subst are warranted.</sup>
- Health Canada continues to collect and consider information regarding *Salvia divinorum* and to consult with key stakeholders, including health officials in other countries, and law enforcement here at home to determine the most appropriate strategy to manage the risks associated with the use of this substance.

Deleted: warrant regulation

Deleted: in Canada

Comment [B1]: This language is closer to what is in the IYH article

Deleted: *Salvia divinorum*

**Supplementary Messages:**

**On the classification of *Salvia divinorum*:**

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act (CDSA)*.
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and

salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

①

When represented... substance and function components of the substance + function (aspects)

to 1st KM

*Salvia divinorum* meets the definition of a natural health product under the *Natural Health Product Regulations* (NHPR). This means that *Salvia* products that are not in compliance with the NHPR may be subject to compliance and enforcement actions.

- As of January 2009, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

If pressed on the lack of statistics on *Salvia divinorum* use in Canada:

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey. This data will be available in 2010.
- It is anticipated that the data from these surveys will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient.

better detail → Suzanne

If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A,

Deleted: asked for specifics on the survey data

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – Very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out, and using these studies to predict the potential for addiction and abuse associated with *Salvia divinorum* is difficult. More controlled systematic research in this area is needed.

~~Health Canada has only received a limited number of communications indicating concern with respect to *Salvia divinorum* from law enforcement agencies, and none of these has advised that the use of *Salvia divinorum* poses any threat to public safety.~~

eland c Bronn wynn's stuff

Deleted: ¶ <#>Further data from the two national surveys, i.e., the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in 2010.¶

The sale for hallucinogenic purposes is illegal under... CTE actions are limited

What are the risks associated with the use of salvia purported to be

How is it available if we know what it does?

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Product Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Product Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only anecdotal information about the last three of the above-mentioned factors, and thus is not yet convinced that the controls imposed by the CDSA are an appropriate strategy for managing the risks associated with the use of *Salvia divinorum*. It is anticipated that the data from the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.

change to use wording from KI

**Comment [B2]:** Suggest replacing this sentence with this line from IYH article:  
  
there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks.

para 7

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**If pressed: Q. Has Health Canada issued any kind of warning to Canadians about the use of *Salvia divinorum*?**

**A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.**

**Background**

*Salvia divinorum* is a species of sage belonging to the mint family that is chewed or smoked in order to induce its psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years,

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

**Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration has estimated that:**

- 1.8 million persons aged 12 or older have used *Salvia divinorum* at least once in their lifetime, and approximately 750,000 did so in the past year
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (>26 years of age)
- Young adults were three times more likely than youths aged 12 to 17 to have used *Salvia divinorum* in the past year
- Use was more common in males than females

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

**Deleted:** The results from the 2009 Ontario Student Drug Use and Health Survey, which were published on November 18, 2009, indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.¶

¶ It is anticipated that the data from the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about the use of this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.¶

**Deleted:** While no validated data exist regarding usage in Canada, d

**Comment [C3]:** Leave in?

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Discussed April 11/10

## Salvia divinorum

Deleted: (Redline) - CSTD Proposed Revisions - December 23, 2009

### The Issue

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. Certain Web sites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastra, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff encens special, and salvia.

Health Canada recommends that you avoid using this substance because very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect you with each use.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico for many years.

add back ←

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of formats, including seeds and plant cuttings for growing purposes. Fresh or dried leaves are intended to be chewed, swallowed or smoked. Liquid preparations are also available.

Deleted: ¶  
Deleted: .....  
Deleted: Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes (e.g., to treat such conditions as headache or stomach upset), or to induce a "mystical" or hallucinogenic experience for spiritual purposes.¶

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);

- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

A major concern about *S. divinorum* is that there have only been a few scientific studies about the way it affects the body and the brain. Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

Deleted: the fact

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The information regarding physical dependence or addiction to *S. divinorum* is unclear, ~~although it appears the potential for either is low.~~

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

Also, remember that just because a drug is plant-based or "natural," it does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this substance have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health, and consumers should apply the "buyer beware" principle.

Deleted: heed

Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

### The Legal Status of *Salvia divinorum*

#### In Canada

Neither *S. divinorum* nor salvinorin A is currently regulated under the *Controlled Drugs and Substances Act* (CDSA). When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors:

- international requirements and trends in controlling the substance;
- similarity to other substances already regulated under the CDSA;
- whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.);
- the potential for abuse and the risk of addiction associated with the substance;
- the extent of actual abuse of the substance in Canada and elsewhere;

- overall risk to public health and safety posed by the substance.

In the case of *S. divinorum*, there is simply not enough information available to determine whether regulation under the CDSA is the best option to manage the potential risks. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey, and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Further data from the two national surveys will be available in 2010. It is anticipated that such data will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

**In Other Countries**

Several countries (e.g., Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

**Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining the most appropriate strategy to manage the risks associated with the use of *S. divinorum*.

**Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

Report online at the MedEffect™ Canada Web site

Call toll-free at 1-866-234-2345

Complete a Canada Vigilance Reporting Form and either:

Fax toll-free to 1-866-678-6789

Mail to: \_\_\_\_\_ Canada Vigilance Program

\_\_\_\_\_ Health Canada

AL 0701C,

\_\_\_\_\_ Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

*if this regulation as a controlled substance is warranted.*

**Your Notes**

DRAFT  
April 20, 2010

### Media Lines Regulatory Control of *Salvia Divinorum*

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* on the Canadian market. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

#### Key Messages:

- Health Canada advises Canadians not to use *S. divinorum* products because very little is known about the substance and its potential effects on the brain and/or body.
- Since it is used primarily for its hallucinogenic properties, *S. divinorum* products would meet the definition of a drug under the *Food and Drugs Act*. To date, no *S. divinorum* products have been licensed for sale in Canada. The illegal sale of these products would be subject to compliance and enforcement actions by Health Canada.
- Health Canada continues to collect and study information as it becomes available, and to consult with law and health officials domestically and internationally to determine the best way to manage the risks associated with the use of *Salvia divinorum* and whether it needs to be controlled under the *Controlled Drugs and Substances Act*.

Deleted: to cause adverse

#### Supplementary Messages:

##### *On the classification of *Salvia divinorum*:*

- When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens such as *S. divinorum* work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have market authorization, and as of January 2010, no *S. divinorum* product has been licensed by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.
- As of January 2010, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers – Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.

***If pressed on the lack of statistics on Salvia divinorum use in Canada:***

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey. The results from these surveys are anticipated in the Spring/Summer of 2010.
- It is anticipated that the data from these surveys will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient.

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – When *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without a licence authorizing it to be marketed in Canada, and as of January 2010, no *S.*

*divinorum* product has been licensed. The illegal sale of *S. divinorum* is subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

With respect to the ill effects, an insufficient number of controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans and animals have been carried out. As such, it is difficult to predict the potential for addiction and abuse of *Salvia divinorum*. More controlled systematic research in this area is needed.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675. The Canada Border Services Agency has already targeted imports of products containing *Salvia divinorum*.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum*. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Comment [D1]:** I think the term "import target" could be viewed as vague for the general public. See proposed alternate wording.

**Formatted:** Font: Italic

**Deleted:** An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

**Comment [D2]:** Does the lack of information not extend to all of the factors identified?

**Deleted:** about the last three of

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The data from the two national surveys will be available in 2010.

Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**If pressed: Q. Has Health Canada issued any kind of warning to Canadians about the use of *Salvia divinorum*?**

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

#### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. (It's) leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) estimated that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba estimated that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.
- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

Comment [C3]: Leave in?

*Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique and generally is reported to be unpleasant.

## ***Salvia divinorum***

### **The Issue**

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. *S. divinorum* is a plant, some street names for which include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

While certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs, when *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without a licence authorizing it to be marketed in Canada. As of January 2010, no *S. divinorum* product has been licensed.

Deleted: C

Deleted: . However,

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain. There is also no way to predict how it will affect you with each use.

Deleted: *S. divinorum* is a plant. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. ¶

### **Background**

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been traditionally used for spiritual and medicinal purposes by the Mazatec Indians. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

~~Oaxaca~~ Mexico

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes. However, consumers have no way to know what these illegal products actually contain.

### **Risks of Using *Salvia divinorum***

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

→ Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

There is also insufficient information regarding *S. divinorum*'s potential to produce physical dependence and/or addiction.

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### The Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have market authorization. Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010 no *S. divinorum* product has been licensed by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA) as there is simply not enough information available to determine

#### **Deleted: Minimizing Your Risk!**

**Deleted:** Also, remember that just because a drug is plant-based or "natural," does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this plant or Salvinorin A have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health. ¶

**Deleted:** Natural health products that have been reviewed and approved by Health Canada are labelled with one of the following:¶  
<#>a Natural Product Number (NPN); or¶  
a Drug Identification Number - Homeopathic Medicine (DIN-HM).

**Formatted: Bullets and Numbering**

**Formatted: Indent: Left: 0 cm, Hanging: 1.27 cm**

**Deleted: ,**

**Deleted: and a**

**Deleted:** . When assessing whether to add a substance to one of the Schedules to the CDSA, Health Canada considers the following factors: ¶  
<#>international requirements and trends in controlling the substance:¶  
<#>similarity to other substances already regulated under the CDSA:¶  
<#>whether there may be legitimate uses of the substance (e.g., potential health benefits, use in manufacturing, etc.): ¶  
<#>the potential for abuse and the risk of addiction associated with the substance:¶  
<#>the extent of actual abuse of the substance in Canada and elsewhere:¶  
<#>overall risk to public health and safety posed by the substance.¶  
¶  
In the case of *S. divinorum*,

whether regulation under the CDSA is warranted. Questions about the use of *S. divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Further data from the two national surveys will be available in 2010. It is anticipated that such data will help address some of the information gaps about this substance and contribute to future decisions that Health Canada may make about this plant and its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

**Comment [D1]:** If we do mention the CDSA in the IYH, do we need to explain the consequences of scheduling under the CDSA as opposed regulation under the FDA?

#### In Other Countries

Several countries have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and continues to consult with key stakeholders, including health officials in other countries, and law enforcement officials here at home. This will assist in determining whether Health Canada's approach to managing the risks associated with the use of *S. divinorum* should be modified.

Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

Report online at the MedEffect™ Canada Web site

Call toll-free at 1-866-234-2345

Complete a Canada Vigilance Reporting Form and either:

Fax toll-free to 1-866-678-6789

Mail to: Canada Vigilance Program  
Health Canada  
AL 0701C  
Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

### Media Lines Regulatory Control of Salvia Divinorum

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: on the

Deleted: ian market

#### Key Messages:

- Health Canada advises Canadians not to use *S. divinorum* products because very little is known about the substance and its potential effects on the brain and/or body.
- When *S. divinorum* is manufactured, sold or represented as a hallucinogen to modify organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the Natural Health Products Regulations and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or a Drug Identification Number – Homeopathic Medicine (DIN-HM).
- Health Canada continues to collect and study information as it becomes available, and to consult with law and health officials domestically and internationally to determine the best way to manage the risks associated with the use of *Salvia divinorum* and whether it needs to be controlled under the *Controlled Drugs and Substances Act*.

Deleted: to cause adverse

Deleted: Since it is used primarily for its hallucinogenic properties, *S. divinorum* products would meet the definition of a drug under the *Food and Drugs Act*. To date, no *S. divinorum* products have been licensed for sale in Canada. The illegal sale of these products would be subject to compliance and enforcement actions by Health Canada.

#### Supplementary Messages:

##### On the classification of *Salvia divinorum*:

- When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens such as *S. divinorum*, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

Deleted: , work by modifying organic functions in the brain

Formatted: Indent: Left: 0.63 cm

- It is illegal to sell NHPs in Canada unless they have been approved by Health Canada and assigned a Natural Product Number (NPN) or Drug Identification Number - Homeopathic Medicine. As of January 2010, no *S. divinorum* products have been approved for sale by Health Canada. The sale and distribution of unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.
- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted:

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers**

**Q1 – If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – When *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without being approved by Health Canada prior to sale in Canada; as of January 2010, no *S. divinorum* NHPs have been approved for sale. The illegal sale of NHPs containing *S. divinorum* is subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

Deleted: without a licence authorizing it to be marketed

Deleted: , and

Deleted: product has been licensed

With respect to the ill effects, not enough controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans and animals have been carried out. As such, it is difficult to predict the potential for addiction and abuse of *Salvia divinorum*. More controlled systematic research in this area is needed.

Deleted: an insufficient number of

Deleted: of the

## Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

## Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Deleted: made

Comment [D1]: I think the term "import target" could be viewed as vague for the general public. See proposed alternate wording.

## Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?

Deleted: An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Deleted: about the last three of

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the two national surveys will be available in 2010.

**Deleted:** and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The

**Deleted:** d

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Deleted:** Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.¶

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize the risk to the general population. These data also cannot be used to determine the incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Deleted:**

**If pressed: Q. Has Health Canada issued any kind of warning to Canadians about the use of *Salvia divinorum*?**

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

**Deleted:** '

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique and generally is reported to be unpleasant.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) estimated that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba estimated that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.
- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

Comment [C2]: Leave in?

## *Salvia divinorum*

### Issue

Deleted: The

Recently there have been reports suggesting that Canadian teens and young adults are using a substance called *Salvia divinorum* (*S. divinorum*) for its ability to produce hallucinations. *S. divinorum* is a plant, some street names for which include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain. There is also no way to predict how it will affect you with each use.

### Background

*S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been traditionally used for spiritual and medicinal purposes by the Mazatec Indians. Traditional use involves chewing the leaves or using them to make a tea for medicinal purposes or to induce a "mystical" or hallucinogenic experience for spiritual purposes.

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes. However, consumers have no way to know what these illegal products actually contain.

Deleted: Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs. However, when *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without a licence authorizing it to be marketed in Canada. As of January 2010, no *S. divinorum* product has been licensed. ¶

Deleted: *S. divinorum* is a plant. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia. ¶

### Risks of Using *Salvia divinorum*

*S. divinorum*'s effects, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination;
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

Scientists know which brain receptors are targeted by the active ingredient, salvinorin A, but very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The potential of *S. divinorum* to produce physical dependence and/or addiction is also not known.

Health Canada recommends that you avoid using *S. divinorum*. Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010 no products containing *S. divinorum* have been approved by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). This is because there is not enough information available to determine whether regulation as a controlled substance is warranted. In an effort to collect more information about the use of *S. divinorum*, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. **Deleted:** Minimizing Your Risk!

**Deleted:** Also, remember that just because a drug is plant-based or "natural," does not mean it is safe. Under certain conditions of use, *S. divinorum* meets the definition of a "natural health product" (NHP) under Health Canada's *Natural Health Products Regulations*. However, no NHPs containing this plant or Salvinorin A have been approved for sale in Canada. This means that products claiming to contain *S. divinorum* have not been reviewed by Health Canada for safety, efficacy or quality. As such, they may be counterfeit or contain other ingredients that pose risks to health. ¶

### In Other Countries

Several countries have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A. In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution (e.g., no sales to anyone under the age of 18).

Deleted: Background

¶  
¶ *S. divinorum* is a species of sage that belongs to the mint family. It is known to have psychotropic effects, which means it affects the mind and mental processes. However, consumers have no way to know what these illegal products actually contain. ¶

### Health Canada's Role

Health Canada continues to collect and consider information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding *S. divinorum*.

Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

### Media Lines Regulatory Control of Salvia Divinorum

#### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

Deleted: on the  
Deleted: ian market

#### Key Messages:

- Health Canada advises Canadians not to use *S. divinorum* products because very little is known about the substance and its potential effects on the brain and/or body.
- When *S. divinorum* is manufactured, sold or represented as a hallucinogen to modify organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or a Drug Identification Number – Homeopathic Medicine (DIN-HM).
- Health Canada continues to collect and study information as it becomes available, and to consult with law and health officials domestically and internationally to determine the best way to manage the risks associated with the use of *Salvia divinorum* and whether it needs to be controlled under the Controlled Drugs and Substances Act.

Deleted: to cause adverse

Deleted: Since it is used primarily for its hallucinogenic properties, *S. divinorum* products would meet the definition of a drug under the Food and Drugs Act. To date, no *S. divinorum* products have been licensed for sale in Canada. The illegal sale of these products would be subject to compliance and enforcement actions by Health Canada.

Formatted: Font: Italic

Formatted: Bullets and Numbering

#### Supplementary Messages:

##### On the classification of *Salvia divinorum*:

- When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens such as *S. divinorum*, it meets the definition of a Natural Health Product (NHP) in accordance with the Natural Health Products Regulations and the definition of a drug under the Food and Drugs Act.

Deleted: , work by modifying organic functions in the brain

Formatted: Indent: Left: 0.63 cm

- It is illegal to sell NHPs in Canada unless they have been approved by Health Canada and assigned a Natural Product Number (NPN) or Drug Identification Number - Homeopathic Medicine. As of January 2010, no *S. divinorum* products have been approved for sale by Health Canada. The sale and distribution of unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

Deleted: All

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

***If pressed on the lack of statistics on *Salvia divinorum* use in Canada:***

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* have been included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey. The results from these surveys are scheduled to be released in the Spring/Summer of 2010.
- It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about this plant and its active ingredient.

Deleted: <#>As of January 2010, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.¶

Deleted:

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

**Questions and Answers**

**Q1 - If Health Canada is aware of *Salvia divinorum*'s ill-effects, why isn't it illegal?**

A1 – When *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without being approved by Health Canada prior to sale in Canada; as of January 2010, no *S. divinorum* NHPs have been approved for sale. The illegal sale of NHPs containing *S. divinorum* is subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate.

Deleted: without a licence authorizing it to be marketed

Deleted: , and

Deleted: product has been licensed

With respect to the ill effects, not enough controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans and animals have been carried out. As such, it is difficult to predict the potential for addiction and abuse of *Salvia divinorum*. More controlled systematic research in this area is needed.

Deleted: an insufficient number of

Deleted: of the

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* and/or are found to pose a risk to the health of Canadians may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675. . ↓

Deleted: made

Comment [D1]: I think the term "import target" could be viewed as vague for the general public. See proposed alternate wording.

Deleted: An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether scheduling a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in controlling the substance;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

Deleted: about the last three of

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the two national surveys will be available in 2010.

**Deleted:** and contribute to future decisions that Health Canada may make about this plant and its active ingredient. The

**Deleted:** d

**Deleted:** Health Canada will continue to collect and consider information regarding *Salvia divinorum* as it becomes available.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize the risk to the general population. These data also cannot be used to determine the incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *Salvia divinorum*.

**Deleted:**

**If pressed: Q. Has Health Canada issued any kind of warning to Canadians about the use of *Salvia divinorum*?**

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

**Deleted:**

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique and generally is reported to be unpleasant.

Formatted: Font: 12 pt

Formatted: Font: 12 pt

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) estimated that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba estimated that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.
- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

Comment [C2]: Leave in?

## Salvia divinorum

### Issue

Salvia divinorum (S. divinorum) is a species of sage belonging to the mint family. Some street names for S. divinorum include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Deleted: .

Formatted: Font: Italic

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain. There is also no way to predict how it will affect you with each use.

Comment [JK1]: We are suggesting deletion of this para as it seems to introduce a whole lot of complex ideas that are then not fully explained until later in the article.....

### Background

*S. divinorum* is known to have psychotropic effects, which means it can affect the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience).

Deleted: However, when *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drugs Act*. No drug can be sold legally without a licence authorizing it to be marketed in Canada. As of January 2010, no *S. divinorum* product has been licensed.

Deleted: ¶

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

### Risks Associated with the Use of *Salvia divinorum*

The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

Deleted: 's effects

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination; and
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;

- how much is used;
- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

Deleted: S

Deleted: but

The potential of *S. divinorum* to produce physical dependence and/or addiction is also not known.

Deleted: re is also insufficient information regarding *S. divinorum*'s

Formatted: Font: Italic

Deleted: .

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

Formatted: Bullets and Numbering

Deleted: ,

Formatted: Indent: Left: 0 cm, Hanging: 1.27 cm

As of January 2010 no products containing *S. divinorum* have been approved by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). This is because there is not enough information available to determine whether regulation as a controlled substance is warranted. In an effort to collect more information about the use of *S. divinorum*, questions on it were included in the 2008-2009 Youth Smoking Survey and the 2009 Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published in November 2009. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS indicate that 4.9% of responding students in Grades 7-12 have used *Salvia divinorum* at least once in the past year.

**In Other Countries**

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, e.g., no sales to anyone under the age of 18, etc.

**Background**

*S. divinorum* is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for both medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience).

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

**Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding *S. divinorum*.

Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

## Media Lines Regulatory Control of *Salvia Divinorum*

### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* because very little is known about the substance and its potential effects on the brain and/or body.
- Because of its hallucinogenic properties, products containing *S. divinorum* meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* may be subject to compliance and enforcement action under the *Food and Drug Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

### Supplementary Messages:

*On the classification of *Salvia divinorum*:*

- When products containing *S. divinorum* are manufactured, sold or represented for use in modifying organic functions in humans (where this would include having a hallucinogenic effect), they meet the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

It is illegal to sell NHPs in Canada unless they have been approved by Health Canada and assigned a Natural Product Number (NPN) or Drug Identification Number - Homeopathic Medicine. As of January 2010, no products containing *S. divinorum* s have however been approved for sale by Health Canada.

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

**Deleted:** market authorization,

**Deleted:** and a

**Deleted:** product

**Comment [JK1]:** We have edited this text but at the end of the day, the content is exceedingly repetitive with the key messages on Page 1. Accordingly, I suggest that we delete all the highlighted text and change the supp heading to read "Salvia as a Controlled Substance"

**Deleted:** has been licensed

**Deleted:** All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Health Products and Food Branch Inspectorate. ¶

***If pressed on the lack of statistics on *Salvia divinorum* use in Canada:***

- Health Canada is taking steps to address this lack of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results are scheduled to be released in late June 2010
- It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.

**Deleted:** <#>As of January 2010, Health Canada had not issued any Natural Product Numbers (NPN) or Drug Identification Numbers - Homeopathic Medicine (DIN-HM) for *Salvia divinorum* products.¶

***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

## Questions and Answers

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* without their being approved by Health Canada prior to sale.

With respect to adverse effects, not enough controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans and animals have been carried out. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*, and it is for this reason, that Health Canada is not proceeding to regulate it as a controlled substance at this point in time.

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

**Comment [JK2]:** Lisa- I think NHPD should be consulted again on this one as now I understand there is something called the Raw Material Policy that may apply??

**Comment [JK3]:** Point is that if they don't meet the regs, they don't meet the regs, it is moot, whether they also pose a risk to health.....

**Deleted:** and/or are found to pose a risk to the health of Canadians

**Comment [JK4]:** I am removing the reference to import target for two reasons: 1) unless we want to get into a detailed explanation of what an import target is, it is probably best to leave the term out as most people will not understand and 2) I have actually confirmed with the Inspectorate and apparently, the import targets that were in place for *Salvia* have now expired.

**Deleted:** made

**Deleted:** An import target for products containing *Salvia divinorum* has already been placed with Canada Border Services Agency.

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Health Canada has only limited information on some of the above-mentioned factors, and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

It is anticipated that the data from the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey in addition to the results from the 2009 Ontario Student Drug Use and Health Survey will help address some of the information gaps about this substance. Data from the Youth Smoking Survey has just been released and data from the 2009 edition of CADUMS will be available in late June 2010.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize any risk of similar reactions to the general population. In particular, Health Canada does not have any information about the number of individuals in Canada using or who have used *Salvia divinorum*.

*If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum**

Deleted: : Q. Has

Formatted: Font: Italic

Deleted: the use of

Deleted: ?

Formatted: Font: Italic

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. These effects are short-acting in nature and include hallucinations, dysphoria, out-of-body experiences, unconsciousness and short-term memory loss. The effects, which vary from person to person, are also often described as unpleasant.

The leaves of this plant have been used traditionally for spiritual and medicinal purposes by the Mazatec Indians in Mexico.

The use of *Salvia divinorum* as a psychotropic agent first came to Health Canada's attention some years ago. *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs.

While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique.

Data from the 2009 Ontario Student Drug Use and Health Survey (OSDUHS) published by the Centre for Addiction and Mental Health (CAMH) indicate that:

- 4.4% of students (grades 7-12) used *Salvia divinorum* in the past year.
- 5.4% of students (grades 7-12) ever used *S. divinorum*.
- Use of *S. divinorum* was significantly higher in males than in females (6.2% vs. 2.3%) in 2009.

Data from the 2007 report on Alcohol and Other Drugs published by the Addictions Foundation of Manitoba indicate that:

- 3.7% of males vs. 2.2% of females (grades 7-12) used *S. divinorum* during that year.

Data from a 2006 National Survey on Drug Use and Health Report, published by the U.S. Substance Abuse and Mental Health Services Administration estimated that:

- 0.3% of persons aged 12 or older used *S. divinorum* in 2006.
- 0.6% of persons between the ages of 12 and 17 used *S. divinorum* in 2006.
- 1.7% of persons between the ages of 18 to 25 used *S. divinorum* in 2006.
- Young adults (18-25) were nearly three times more likely than youths aged 12-17 to have used *S. divinorum* in 2006.
- Males between the ages of 12-25 were three to four times more likely than females in the same age range to have used *S. divinorum* in 2006.

**Deleted:** *Salvia divinorum* is widely advertised and promoted on the Internet and sold in various alternative lifestyle stores as a "legal" alternative to street drugs. ¶

¶ While some users have reported that the psychotropic effects of *Salvia divinorum* resemble those induced by other hallucinogens, such as LSD and phencyclidine, the overall experience appears to be quite unique and generally is reported to be unpleasant.

DRAFT  
May 26, 2010

## Media Lines Regulatory Control of *Salvia Divinorum*

### Issue

Since 2006, Health Canada has noted ongoing media interest regarding the availability of *Salvia divinorum* in Canada. Health Canada has also received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *Salvia divinorum*, particularly given reports from scientific and media sources suggesting that *Salvia divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties.

### Key Messages:

- Health Canada advises Canadians not to use products containing *S. divinorum* and/or salvinorin A because very little is known about the substance and its potential effects on the brain and/or body, and its impact on physical and mental functions.
- Because of its hallucinogenic properties, products containing *S. divinorum* and/or salvinorin A meet the definition of a natural health product (NHP) under the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.
- It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with a Natural Product Number (NPN) or Exemption Number or a Drug Identification Number – Homeopathic Medicine (DIN-HM). The illegal sale of products containing *S. divinorum* and/or salvinorin A may be subject to compliance and enforcement action under the *Food and Drug Act*.
- Health Canada will continue to collect and study information about *S. divinorum* as it becomes available, and to consult with law enforcement and health officials domestically and internationally in order to determine the best way to manage the risks associated with its availability in Canada.

Formatted: Font: Italic

### Supplementary Messages:

#### *On the classification of *Salvia divinorum*:*

- When products containing *S. divinorum* and/or salvinorin A are manufactured, sold or represented for use in modifying organic functions in humans (where this would include having a hallucinogenic effect), they meet the definition of a

Formatted: Font: Not Bold

Deleted: ,

Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*.

It is illegal to sell NHPs in Canada unless they have been authorized by Health Canada and assigned a Natural Product Number (NPN) or Exemption Number or Drug Identification Number - Homeopathic Medicine. As of September 2010, no products containing *S. divinorum* and/or salvinorin A have been approved for sale by Health Canada.

Deleted: January

Deleted: however

Formatted: Font: Not Bold

Deleted:

- In Canada, neither the herb *Salvia divinorum* nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA).
- *Salvia divinorum* is not listed under the United Nations Drug Control Conventions and does not have to be regulated as a controlled substance in any of the countries (including Canada) that are signatories to these Conventions.
- Several countries (Australia, Belgium, Denmark, Finland, Germany, Italy, Japan, South Korea, Spain and Sweden) have placed controls on the import and/or sale of *Salvia divinorum* and/or salvinorin A. Although some individual U.S. states have implemented laws restricting its use, sale and/or distribution, *Salvia divinorum* and salvinorin A are not federally regulated under the *Controlled Substances Act* in the United States.

Deleted: ¶

#### ***If pressed on the lack of statistics on *Salvia divinorum* use in Canada:***

- Health Canada is taking steps to address the paucity of data. Questions about the use of *Salvia divinorum* were included in the 2008-2009 Youth Smoking Survey, and the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS). The results from the Youth Smoking Survey were released on May 31, 2010 and the 2009 CADUMS results were released on June 24, 2010.
- It is anticipated that the data from these surveys will contribute to future decisions that Health Canada may make about how this plant and its active ingredient should be regulated.

Deleted: are scheduled to be

Deleted: in late

Deleted:

#### ***If pressed regarding the results of the 2009 Ontario Student Drug Use and Health Survey:***

- The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Health Canada will consider this data in its ongoing examination of *Salvia divinorum* and salvinorin A.

#### **Questions and Answers**

**Q1 – If Health Canada is aware of adverse effects associated with the use of *Salvia divinorum*, why isn't it illegal?**

A1 – Because *S. divinorum* meets the definition of an NHP under the *Natural Health Product Regulations*, it is illegal to manufacture, sell or provide products containing *S. divinorum* and/or salvinorin A without their being authorized by Health Canada prior to sale. With respect to adverse effects, there are insufficient controlled scientific studies looking into the physical and psychotropic effects of *Salvia divinorum* on humans. As such, it is difficult to predict the potential for addiction and abuse associated with *Salvia divinorum*. Health Canada will continue to analyze the available evidence in order to determine the most appropriate method of control of *S. divinorum*.

Formatted: Font: Not Bold

Deleted: ,

Deleted: Based on the available evidence, Health Canada is not proceeding to regulate it as a controlled substance at this point in time.

Formatted: Highlight

**Q2 – How can Health Canada regulate a product containing *Salvia divinorum*, but not the sale of *Salvia divinorum* itself?**

A2 – The *Natural Health Products Regulations* apply to finished natural health products that are packaged, labelled and ready to be marketed to consumers. They do not apply to raw materials, such as the plant, *Salvia divinorum*.

**Q3 – What will Health Canada do if it finds products containing *Salvia divinorum* on the market?**

A3 – *Salvia divinorum* products that are not in compliance with the *Natural Health Products Regulations* may be subject to compliance and enforcement action by Health Canada. Complaints about the illegal sale of drugs containing *S. divinorum* and/or salvinorin A can be referred to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

Formatted: Font: Not Bold

Deleted: ,

**Q4 – Past media reports have indicated that Health Canada is assessing the possibility of regulating *Salvia divinorum* as a controlled substance. What does that involve and what stage is it at?**

A4 - Health Canada considers several factors in determining whether regulation of a substance under the *Controlled Drugs and Substances Act* (CDSA) is warranted. These include:

- International requirements and trends in international control;
- Chemical and pharmacological similarity to other substances already regulated under the CDSA;
- Legitimate uses of the substance (i.e., therapeutic, industrial or commercial);
- Potential for abuse and risk of addiction associated with the substance;
- Extent of actual abuse of the substance in Canada and internationally; and
- Overall risk to public health and safety posed by the substance.

Deleted: has only limited

Deleted: on some of

Health Canada is continuing to analyze information related to the above-mentioned factors as it becomes available in order to determine the most appropriate mechanism of control of *S. divinorum*.

Deleted: , and thus there is simply not enough information available to determine whether regulation of *Salvia divinorum* under the CDSA is warranted.

**Q5 – Didn't an internal report from Health Canada's Marketed Health Products Directorate recommend that *Salvia divinorum* be scheduled under the CDSA? Why has that recommendation not been acted upon?**

A5 – See A4

**Q6 – What is the significance of the adverse reaction reports that Health Canada has received with respect to the use of *Salvia divinorum*?**

A6 – Health Canada has received four domestic adverse reaction reports related to the use of *Salvia divinorum* as a hallucinogen through the Canada Vigilance database. The number of reports and the nature of reactions reported are, however, not adequate to characterize any risk of similar reactions to the general population. In particular, Health Canada has limited information about the number of individuals in Canada using or who have used *Salvia divinorum*.

***If pressed on whether Health Canada has issued any kind of warning to Canadians about *Salvia divinorum*:***

A. Health Canada is developing an It's Your Health (IYH) article on *Salvia divinorum* to help inform the general public about the risks associated with the use of this substance.

### **Background**

*Salvia divinorum* is a species of sage belonging to the mint family. Its leaves are chewed or smoked to obtain psychotropic effects. Subject Fw: Proposed changes to Salvia IAS

Hi Daniel,

Here is the latest draft of the IAS for Salvia.

Draft Salvia Divinorum IAS Jan 13 2010.doc

The email attached below includes a summary of the proposed changes, which Denis and I had discussed and he was going to look over before we presented them to Jocelyn. I've been waiting to meet with Jocelyn before actually starting on the next IAS draft.

[DD/MM/2009]

### 2. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are controlled under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health

Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, in order to determine whether or not *S. divinorum*, and/or salvinorin A, should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

A 2006 National Survey on Drug Use and Health Report, published in February 2008 by the Substance Abuse and Mental Health Administration in the United States, also estimated that:

- 1.8 million persons aged 12 or older used *Salvia divinorum* in their lifetime, with approximately 750,000 having done so in the past year;
- Use was more common among young adults (18 to 25 years old) as opposed to older adults (> 26 years of age);
- Young adults were nearly three times more likely than youths, aged 12 to 17, to have used *Salvia divinorum* in the past year; and
- Use was more common in males than in females.

---

1 U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

2 Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June, 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk, defined as "A situation in which there is a reasonable probability that the use of, or exposure to, a product, will cause moderate or mild adverse health consequences.

Further to an ADM discussion in April 2007, DSCSD organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) on May 16, 2007 to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFB as a Type II substance. MHPD was to send the HRA and SA to DCSCD, look into preparing an adverse reaction case presentation in the ADR Newsletter, and explore the possibility of developing a product advisory. HPFBI was to determine compliance activities based on the HRA Type II classification and check with Canada Border Services Agency (CBSA) to determine if any further information regarding *S. divinorum* shipments was available. The Office of Research and Surveillance, DSCSD was to continue to work on the *S. divinorum* Fact Sheet and explore the feasibility of a health food/natural food store survey on *S. divinorum*. OCS was to gather information from Australia regarding its scheduling decision and to find out whether the DEA had any plans to schedule *S. divinorum* in the near future.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what is known about *S. divinorum* from a regulatory perspective and to reach consensus on next steps.

The following action items came out of this meeting:

- (1) DSCSD to submit a response to the MHPD/NHPD analytical documents and MHPD/NHPD to make changes accordingly;
- (2) DSCSD to finalize the latest version of the media lines on *S. divinorum* and put them forward, via Communications, for approval in HPFB;
- (3) DSCSD to find out the status of draft fact sheet that was being developed by its Office

of Research and Surveillance;

(4) HPFBI to discuss the potential allocation of additional resources, e.g., additional inspectors, etc. to the *S. divinatorum* file; and

(5) DSCSD to explore the notion of scheduling, i.e., carry out a preliminary scheduling assessment, as part of a mid to long-term action plan.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinatorum* and to determine an agreed upon approach for subsequent steps.

The following action items came out of that meeting:

(1) Review and provide comments on *S. divinatorum* IAS and SA and revise and re-issue IAS and SA, as needed;

(2) circulate draft Fact Sheet for comment and explore the possibility of developing a public-friendly communication;

(3) prepare draft media lines for *S. divinatorum* and circulate for comment;

(4) contact DAS labs for any information on *S. divinatorum*;

(5) prepare project charter for *S. divinatorum* working group;

(6) contact Public Health Agency Canada (PHAC) for representation;

(7) continue work on scheduling assessment for *S. divinatorum*; and

(8) continue sharing information relating to *S. divinatorum* as it arises.

#### **4.1 Legislative Frameworks for Drug Control in Canada**

##### **4.1.1 Food and Drug Regulations**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in

(a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,

(b) restoring, correcting or modifying organic functions in human beings or animals, or

(c) disinfection in premises in which food is manufactured, prepared or kept;

##### **4.1.2 Natural Health Product Regulations**

The *Natural Health Products Regulations* (NHPR) came into force in January, 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a product identification number preceded by the prefix NPN, or, in the case of a homeopathic medicine, by the letters DIN-HM on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein, is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule to the CDSA is should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in Control/Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

#### ***Australia***

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision. Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>3</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances.

#### ***Denmark***

Shortly after, in 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

#### ***Germany***

---

<sup>3</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum*, and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale i.e., that beyond medical treatment or research purposes, will be subject to up to five years imprisonment or to a fine of up to five million yen.

### ***Spain***

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other alleged "toxic" herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

In Estonia, Finland, Iceland and Norway *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of October 2009, fourteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Illinois, Kansas, Nebraska, North Dakota, Ohio, Oklahoma, and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina and Tennessee have enacted other forms of legislation restricting the distribution of the plant. Legislative bills proposing regulatory controls died in Alabama, Alaska, Georgia, Indiana, Maryland, South Carolina, Texas and West Virginia.

### ***California***

For example, effective January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009. The new law came into effect on December 1, 2009.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not however a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a

retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals “of concern,” without legal implication.

#### 4.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>4</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>5</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>6</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by LSD or PCP.<sup>7</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>8</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>9</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>10</sup> In addition, while the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an

unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>11</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>12</sup>

#### 4.2.3 Legitimate Uses of Salvia *Divinorum*

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>13</sup>

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>14</sup> where an infusion of the leaves or ingestion of the leaves is used to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>15</sup> Its main use is however for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>16</sup>

#### 4.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>17</sup> because activation of the MORs causes euphoria, which makes the user want to take them. As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>18</sup> In addition, KOR

agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression, however, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>19</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>20</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration by which it is taken. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. Onset of effect generally takes 5-10 minutes which build over the next hour and last for another hour before the effects begin to subside.<sup>21</sup>

Routes that avoid the hepatic first-pass effect are the quickest and most intense.<sup>22</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500µg of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effect felt from vaporizing salvinorin A powder is about 30 seconds and effects last for about 5-10 minutes and subside over the next 30 minutes.<sup>23</sup>

Smoking is by far the most popular method of administration<sup>24</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A and/or a concentrated extract can also be

used sublingually. *S. divinorum* nor salvinorin A are not injected because the powder is insoluble in water.<sup>25</sup>

Although the various modes of administration lead to variable onset and duration of the effects, the effects of *S. divinorum* are generally accepted to be: becoming objects, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>26</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>27</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering however have also been reported.<sup>28</sup>

The aversive effects of previously studied KOR agonists would predict that the risk of addiction to *S. divinorum* is negligible, however, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out and, therefore, using these studies to predict its potential for addiction and abuse is difficult. In addition, in the studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the reward and aversive effects are also warranted.

Another aspect of *S. divinorum*'s abuse potential stems from its availability. As previously mentioned it is widely available for purchase on the Internet through drug promotional sites and is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling the drug quite affordable and attractive. Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 µg had profound hallucinogenic effects.<sup>29</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, even poor yields of a gram per kilograms of dried leaves would provide a dose for 2000 human

doses.<sup>30</sup> This easy isolation makes buying the drug quite affordable. *S. divinorum* leaves sell for \$0.50-7 per gram, plants for \$20-45 and the liquid extract for \$4-10 per millilitre.<sup>31</sup>

#### 4.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the actual population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% report using *Salvia divinorum* at least once in the past year;
- Males (6.2%) are significantly more likely than females (2.3%) to use *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in the North (9.2%) most likely to use *Salvia divinorum*.

Further data from the two national surveys, i.e., the 2008-2009 Youth Smoking Survey and the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in 2010.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the CDSO druglist, it is not possible to have records of any seizures of it in the database.

<sup>1</sup> NFLIS reported items of salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – September data in 2008.

Two reports regarding the abuse of *S. divinorum* have been published in the academic literature. The first was an international case report in which a young man (19 years of age) described his perceptions after inhaling the smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of dried leaves.<sup>32</sup> The second case involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, thought blocking and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be considered long-term effects of *Salvia* use.<sup>33</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned case reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for unknown period

<sup>32</sup> **Error! Main Document Only.** Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>33</sup> **Error! Main Document Only.** Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

of time.<sup>34</sup> It should be noted that alcohol and general depression were the main confounders in this case. This case did, however, result in the state of Delaware passing a law outlawing *S. divinorum*, and classifying it as a Schedule I controlled substance with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>35</sup>, however, this aversion to the drug is not an effect being echoed in other studies and reports.<sup>36</sup> Moreover, over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said they would probably or definitely use *S. divinorum* again.<sup>37</sup> Therefore, despite the fact that users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>38</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>39</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug,<sup>40</sup> it is difficult to determine the influence these effects have on the use of *S. divinorum*.

#### 4.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen may be on the rise in Canada. It is, however, premature to make this assumption as Health Canada presently does not have any viable statistics on the actual population use of *S. divinorum* across the Canadian population.

The potential for harm to the user and/or other individuals may be increased as users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, distinction between self and surroundings is lost, and at doses greater than 1mg of salvinorin A,

out of body experiences are frequent and loss of consciousness has been reported.<sup>41</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also not received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like all drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>42</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use of *S. divinorum* in Canada and the risk of abuse and/or risk that *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. These data cannot be used to determine incidence of use in the general population, as Health Canada does not have any information about the number of individuals using or who have used *S. divinorum*.

## 7. CONSIDERATIONS

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>46</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>47</sup> Interestingly though, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>48</sup>

The following points should be considered:

- Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen.

<sup>46</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).

<sup>47</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>48</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

- Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada.

*Salvia divinorum* meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that product's that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, it is difficult to ascertain how much *S. divinorum* is currently sold or consumed in Canada at the present time. Several challenges also arise with respect to the importation and domestic movement of such products as they are often declared as incense and therefore cannot be considered non-market natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling clearly indicates that the product is to be used for consumption and/or pharmacological effects (ie. statements regarding contraindications or restrictions on use) upon which the product will no longer meet the definition of a consumer product (i.e. incense) and will meet the definition of a NHP. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above.

- It is also hard to know because we have no way of tracking or counting

Subject Input on Revised IYH and MLs for Salvia

Hi Lisa

Please accept my apologies for taking so very long to get input back to you on these documents. Denis did his part very quickly after you sent the docs to us; it is just that all the prep work for my court case and even the week I was away for the case were so chaotic that I really had no time for anything else.

In any case, here is our input. As you will see, we are still suggesting some changes to the documents, all with the view of a) trying to improve consistency between wording in the IYH and the MLs, and b) making sure that we truly accurate vis a vis the legal status sections/ info. I realize that this likely means another round of circulation to other parties, but you can feel free to put it all on us if you like!

Salvia MLs + OCS Input May 26 2010.doc

IYH + OCS Input May 31 2010.doc

Regarding our comments on the Youth Smoking Survey, here is the link to the 2008-09 results, which were released on May 31, 2010.

<http://www.yss.uwaterloo.ca/index.cfm?section=5&page=288>

Please don't hesitate to contact Denis or I if you have any questions on our input. That said, I am trying to "divorce" Denis from this file, as we have a new person who just started picking up work on the file in my

office- Stephanie Chandler (copied above).

Regards,

Jocelyn

Re: Salvia(Document link: Sherrey Collier)

Hi Sherrey,

The inter-branch discussions in 2007-08 did not conclude that Salvia should be scheduled under the CDSA, but rather that the HPFB conclusion of that nature was not based on a fullsome scheduling assessment (in fact, OCS had not been consulted on the issue analysis MHPD and NHPD had prepared) and that such an assessment was required before any decisions as to how the substance should be regulated could be made. We are now in the final stages of preparing that scheduling assessment, and while we have not yet come to a firm conclusion (the document has not yet gone to the CSS-WG for discussion), it does not seem at this point, that scheduling under the CDSA is warranted at this time. This is the approach that has been taken in the IYH article and related media lines that are currently in the final stages of development.

Hope this helps.

Hello Mark,

Could you tell me if HC has made any decisions/determinations regarding this plant? Do we plan on following other nations in banning or controlling this substance? Because of its highly hallucinogenic properties (especially relating to human health and safety), would HC advise the CBSA to detain the substance pending a HC determination of its admissibility? Would HC be concerned if this substance was being sold in retail outlets?

Any information you could provide, (or if you could point me in the right direction) would be appreciated,

Thanks Mark.

***Salvia divinorum*** (also known as **Diviner's Sage**,<sup>[2]</sup> **ska María Pastora**,<sup>[3]</sup> **Seer's sage**,<sup>[4]</sup> and by its genus name **Salvia**) is a psychoactive plant which can induce dissociative effects. Its native habitat is within cloud forest in the isolated Sierra Mazateca of Oaxaca, Mexico, growing in shady and moist locations.<sup>[5][6]</sup> The plant grows to over a meter high,<sup>[1]</sup> has hollow square stems, large leaves, and occasional white flowers with violet calyx. Botanists have not determined whether *Salvia divinorum* is a cultigen or a hybrid; native plants reproduce vegetatively, rarely producing viable seed.<sup>[7][8]</sup>

### **1.0 Purpose**

This document outlines to the public, staff and stakeholders of the Health Products and Food Branch Inspectorate (Inspectorate) the main elements of the Inspectorate National Border Integrity Program. Through a risk based approach this program aims to effectively and consistently administer the requirements of the *Food and Drugs Act (FDA)* and its associated *Regulations* as they apply to the importation and exportation of health products under the mandate of the Inspectorate.

### **2.0 Background**

The mandate of the Health Products and Food Branch (HPFB) is to take an integrated approach to the management of the risks and benefits of health products and food by minimizing health risk factors to Canadians while maximizing the safety provided by the regulatory system for health products and food; promoting conditions that enable Canadians to make healthy choices; and, providing the public with information so that they can make informed decisions about their health.

The Inspectorate is responsible for the delivery of compliance and enforcement activities aimed to protect the integrity of the supply chain through the use of appropriate measures to manage health and safety risks posed to Canadians due to the use of health products. It is estimated that eighty percent of health products available to Canadians are imported<sup>1</sup>. Consumers rely on Health Canada to verify that only health products approved for sale are available to them in the Canadian market.

In order to achieve a comprehensive regulatory system, it is necessary for the Inspectorate to not only work in collaboration with other government departments, but also establish strategic partnerships with healthcare professionals, industry, consumers, and stakeholders, both domestic and international, in order to maintain a safe supply of health products within the Canadian marketplace.

The National Border Integrity Program delivered by the Inspectorate addresses the challenges created by an increase in the importation of new health products; the rapid expansion of global trade; and the complexity of the supply chain including consumer direct access to less expensive or socially stigmatized products available through internet marketing. The Inspectorate takes a risk management approach to the delivery of the program and collaborates closely with various partners.

In order to achieve a comprehensive regulatory system, it is necessary for the Inspectorate to work in collaboration with other government departments, and to establish strategic partnerships with health care professionals, industry, consumers, and stakeholders, both domestic and international, in order to maintain a safe supply of health products within the Canadian market. The partnership with the Canada Border Services Agency (CBSA) facilitates the enforcement of the requirements under the *FDA* with respect to importation and exportation of health products to mitigate the health and safety risks posed to Canadians.

### **3.0 Scope**

This document outlines the Inspectorate's plan for the delivery of the Border Integrity Program which applies to all health products under the Inspectorate's mandate including: medical devices; human drugs, natural

---

<sup>1</sup> Canada's Proposed Food and Consumer Safety Action Plan 2007.

Health Canada / Health Products and Food Branch Inspectorate

---

health products; blood and blood components for transfusion; semen for assisted conception; human cells, tissues, organs for transplantation; and veterinary drugs moving across the Canadian border.

#### 4.0 Definitions

The following terms are defined for the purposes of this document:

**Food and Drugs Act:** A federal statute regulating the health and safety of food, drugs, cosmetics, and medical devices. The Minister of Health is responsible for the administration of the *Act*.

**Health Products:** A health product includes any product under the mandate of the Health Products and Food Branch (HPFB), with the exception of food products. The HPFB has regulatory responsibilities in the following health product areas: drugs for human use; blood and blood products; medical devices; transplanted tissues and organs; biologics and genetic therapies; natural health products; and veterinary drugs.

#### 5.0 Policy Statement

The Inspectorate, through the National Border Integrity Program and in partnership with CBSA, ensures the consistent administration of the *FDA* at the border and provides information to Canadians so that they can make informed choices related to the importation and exportation of health products. The program applies a risk-based approach to achieve the greatest impact and efficiency of resources by expediting border processing of compliant health products while systematically assessing the compliance of health products that are suspected to be in violation of the *FDA* and its associated *Regulations*.

#### 6.0 Responsibilities

The maintenance and enhancement of health and safety is a responsibility that is shared among government and industry, consumers, healthcare professionals and their respective associations.

It is the Inspectorate's responsibility to conduct border integrity activities in accordance with the pillars of the Border Integrity Program articulated in this document.

Importers must comply with all Canadian legislative and regulatory requirements and have a responsibility for ensuring the safety of all products that they bring into the Canadian market. Healthcare professionals are encouraged to inform the HPFBI of any problems they encounter (adverse reactions, malfunctions, and non-compliance) that may be related to these health products, including those that have been imported. They should ensure that the health products they provide to their clients and patients are authorized by Health Canada.

Consumers have a responsibility for the maintenance of their health and the safe use of marketed health products. In addition, consumers are asked to inform the HPFBI of any problems that they encounter (adverse reactions, malfunctions, and non-compliance) through the use of health products. Consumers are advised to only import products which are authorized for sale in Canada.

#### 7.0 Border Integrity Activities

The National Border Integrity Program supported by four pillars to ascertain that only health products that are in compliance with the *Food and Drugs Act* and associated *Regulations* will enter Canada through importation:

Health Canada / Health Products and Food Branch Inspectorate

---

1. Effective legislative and regulatory framework;
2. Strategic domestic and international partnerships;
3. Increased awareness and public education and;
4. Efficient use of information technology.

### **7.1 Effective legislative and regulatory framework**

Under the *Food and Drugs Act* and its *Regulations*, the Inspectorate has the authority to inspect and take samples of health products intended for importation into Canada upon their arrival. The Inspectorate also requests CBSA to target and detain specific shipments or products for an admissibility determination by the Inspectorate. If at the border, the Inspectorate concludes that a shipment contains health products intended for distribution in Canada that are not in compliance with the *FDA*, the Inspectorate will take the appropriate compliance and enforcement actions based on risk that may include the refusal of entry, use of targets and lookouts to prevent future importation of such products, seizure and/or voluntary disposal.

The CBSA assists Health Canada by detaining shipments of health products for their inspection and decision regarding admissibility. Authority for CBSA to detain such shipments is contained in Section 101 of the *Customs Act*.

### **7.2 Partnership Development (Domestic and International)**

The creation of a National Border Integrity Program is the result of the Inspectorate's goal to seek innovative solutions and ways to improve our business by learning from "best practices" of other regulatory agencies. Many countries have also placed a high priority on border security and the Inspectorate aims to develop and participate in domestic and international partnerships, to share intelligence data and to establish effective mechanisms that support joint actions.

The Inspectorate continues to collaborate with various federal departments and other regulatory agencies such as CBSA, the US Food and Drug Administration, Royal Canadian Mounted Police and other organizations within the health portfolio to prevent, detect, and deter non-compliant health products from entering the country. This is achieved by developing intelligence capacity related to specific incidents, detection methods, lessons learned, and laboratory techniques both domestically and globally to supply program areas with information to enable strategic monitoring, investigations, and laboratory analysis.

The CBSA and the Inspectorate are committed to establishing service standards that guide the criteria for detecting non-compliant health products at the border, and the timeframes for making admissibility determinations.

### **7.3 Public awareness and education**

Effective border integrity is enhanced with the help of an informed public who can both recognize and understand the risks associated with the importation of non-compliant health products. In the context of the National Border Integrity Program, the Inspectorate delivers health promotion activities to inform the CBSA, the general public and trade-chain partners, including importers, brokers, and freight-forwarders, about the requirements to legally import health products into Canada.

### **7.4 Information Technology**

The Inspectorate recognizes the importance of using emerging technological methods to track, trace and verify compliance of health products at the border and within the supply chain. The Inspectorate is one of approximately forty organizations within eleven government departments, participating in the Single Window

Health Canada / Health Products and Food Branch Inspectorate

---

initiative led by CBSA. The initiative is aimed at improving the administration of regulatory requirements at the border as they apply to commercial shipments in an electronic commerce world.

The Single Window Initiative supports the delivery of the Inspectorates Border Integrity Program by using automated risk assessment solution capable of identifying high-risk goods using the Inspectorate criteria that require increased scrutiny while expediting the flow of low-risk goods. For more information on this initiative, refer to the following website.:

## PRAD Telephone Enquiry

**Date of Call:** June 2, 2010

**Subject:** Potential of scheduling *Salvia divinorum* under the CDSA

**Language of Correspondence:** English

**Caller Name:** Deb Steele

**Caller Organization:** Canada Border Services Agency

**Caller Telephone Number:** (613) 954-5188

### CALL SUMMARY:

Deb Steele from the Canada Border Services Agency (CBSA) inquired as to whether there are any plans to schedule *Salvia divinorum* under the *Controlled Drugs and Substances Act*.

I indicated that while there are no plans at this time to schedule *Salvia divinorum* under the *Controlled Drugs and Substances Act*, products containing *Salvia divinorum* are considered to meet the definition of a Natural Health Product (NHP) (in accordance with the *Natural Health Products Regulations*) when manufactured, sold or represented for use in modifying organic functions, i.e., hallucinogenic effects.

It is illegal to sell NHPs in Canada unless they have been approved by Health Canada and assigned a Natural Product Number (NPN) or Drug Identification Number - Homeopathic Medicine. No products containing *S. divinorum* s have, however, been approved for sale by Health Canada.

Notwithstanding these regulatory provisions, Deb Steele asked whether there are any plans for import controls of any kind, and whether further measures will be taken in the future.

Subject Re: Fw: Salvia

Thanks Diane,

My assistant Isabel will send out an invitation to suit Ian's and my availabilities.

Isabel- pls make a note that we may need to arrange a teleconference as Ian may not be able to attend in person. The rest of us here will need a meeting room though.

Hi Ian,

I think it would be great if you could spend a bit of time connecting the dots on border integrity for me, but would like to include a few others from my division that might benefit from the discussion as well. And unfortunately, Friday does not work for me as I am on leave that day.

Can you let me know when you might be available for a short meeting to discuss this further next week? We can host you here at 123 Slater or patch you in by phone if you really can't leave Graham Spry. And feel free to involve others who might need to be there.

In the interim, we will draft a short response to the enquiry that kick-started my email to you, and run it by you before we send.

Jocelyn

Subject Re: Fw: Salvia 

Thanks Ian

I did not know that the import alerts had been allowed to expire. Guess I don't really understand all of this  
border integrity stuff as well as I should as I didn't think that the decision to consider salvia as an NHP was  
mutually exclusive of any attempt to have border officers look for imports of the substance. You are right,  
that technically, salvia does meet the definition of an NHP. I guess the issue is whether there isn't more  
we can do to prevent loads of the stuff coming into Canada given that our scheduling assessment does  
not support regulation as a controlled substance (next to no evidence of abuse potential, addiction liability  
and only mild anecdotal information about risk to public health and safety).

Perhaps you can explain how the raw material policy works?

Subject Re: Fw: Salvia 

Hello Jocelyn.

The Inspectorate does not have any import alerts active for Salvia at the moment.

We used to have a few alerts active however they were allowed to expire in 2008 and 2009 ( one or two on specific importers and one on Salvia Extracts in general). They were allowed to expire after consultation with the "lead" inspector on the file/

If warranted we can re-establish an import alert however as I understand it Salvia can be considered an NHP and could fall under the NHPD Raw Material Policy.

s.19(1)

Hi Ian and Collin,

Can one of you please confirm whether there is still an active customs target in place for salvia/ salvia divinorum? Just that we have received the enquiry below from the Intelligence Directorate at CBSA, and I want to be sure that I provide the correct response.

If the target is still in place, can you pls advise as to what exactly it covers?

For your information, we are presently finalizing our scheduling assessment of salvia, and while we don't have an approved recommendation at this point, our assessment essentially supports the approach being taken by the IYH that is currently in development, i.e., scheduling under the CDSA is not warranted at this time.

Thanks in advance,

Jocelyn

Subject

Hello Mark,

Could you tell me if HC has made any decisions/determinations regarding this plant? Do we plan on following other nations in banning or controlling this substance? Because of its highly hallucinogenic properties (especially relating to human health and safety), would HC advise the CBSA to detain the substance pending a HC determination of its admissibility? Would HC be concerned if this substance was being sold in retail outlets?

Any information you could provide, (or if you could point me in the right direction) would be appreciated,

Thanks Mark.

***Salvia divinorum*** (also known as **Diviner's Sage**,<sup>[2]</sup> **ska María Pastora**,<sup>[3]</sup> **Seer's sage**,<sup>[4]</sup> and by its genus name **Salvia**) is a psychoactive plant which can induce dissociative effects. Its native habitat is within cloud forest in the isolated Sierra Mazateca of Oaxaca, Mexico, growing in shady and moist locations.<sup>[5][6]</sup> The plant grows to over a meter high,<sup>[1]</sup> has hollow square stems, large leaves, and occasional white flowers with violet calyx. Botanists have not determined whether *Salvia divinorum* is a cultigen or a hybrid; native plants reproduce vegetatively, rarely producing viable seed.<sup>[7][8]</sup>

cc  
Subject Re: Salvia Divinorum

This answered everything I needed to know! Thank you very much!

On Tue, Jun 1, 2010 at 4:53 PM, OCS-BSC <ocs-bsc@hc-sc.gc.ca> wrote:

Dear [redacted]

Thank you for your e-mail inquiry of April 7, 2010, regarding the legal status of Salvia divinorum.

Salvia divinorum is a species of sage which belongs to the mint family. It is found in a number of formats, including seeds, extract and plant cuttings for growing purposes.

While several countries have placed controls on the import and/or sale of Salvia divinorum and/or salvinorin A, neither are presently regulated in

Canada under the Controlled Drugs and Substances Act (CDSA). Nevertheless, *Salvia divinorum* can, in some instances, be regulated as a natural health product under the Natural Health Product Regulations (NHPR) if it is sold for a specific therapeutic purpose. However, Health Canada has not to date issued any Natural Product Numbers or Homeopathic Medicine Numbers for *Salvia divinorum* products. This means that *Salvia* products that are being sold as natural health products that are not in compliance with the NHPR may be subject to compliance and enforcement action under the Food and Drugs Act.

With respect to the age restrictions on “legal access” to *Salvia divinorum* which you mention in your e-mail, this likely refers to measures adopted in other jurisdictions (e.g., the state of California in the United States). There are no such measures in place in Canada as *Salvia divinorum* is not regulated in this country.

Health Canada recommends that the use of this substance be avoided as very little is known about the damage it may cause to the body, including the brain. There is also no way to predict how it will affect an individual with each use.

Sincerely,

Diane Allan  
Director  
Office of Controlled Substances  
Controlled Substances and Tobacco Directorate  
Healthy Environments and Consumer Protection Branch  
Health Canada

June 3<sup>rd</sup>, 2010

**Issue:** Increased Traffic of *Salvia divinorum* hallucinogenic psychoactive plant across Canadian Borders.

**Inquiry:** Mrs. Deb Steele of Canada's Border Services Agency(CBSA) had communicated to Mrs. Brenda Paine, Director of the Office of Policy and Strategic Planning, Controlled Substances and Tobacco Directorate regarding potential scheduling of a hallucinogenic drug, and had requested that a staff member in OCS communicate with her. Mrs. Paine's inquiry was re-routed through the Director's office of the Office of Controlled Substances.

**Program History:**

Numerous discussions between HPFB's Natural Health Products Directorate and HECS Office of Controlled Substances have been conducted in the past. HPFB considers *Salvia divinorum* and its active ingredient Natural Health Products despite no NPN's having been assigned.

**Global History:**

In Canada, there has been some media coverage as to the availability of *Salvia divinorum* in the country, where it is still legal to possess, cultivate and sell.

In the United States, *Salvia divinorum*, is not regulated under the *Controlled Substances Act*, however some states have either promulgated (e.g. Delaware, Louisiana, Missouri) or have proposed their own legislation (e.g. Alabama, Alaska, California, Florida, Georgia, Iowa, Illinois, New Jersey, New York, Ohio, Oregon, Pennsylvania, and Texas).

As of May 2007, the U.S. DEA has been conducting an analysis to possibly Schedule *Salvia divinorum*. The considerations for scheduling are as follows;

- Actual and potential for abuse
- Pharmacology
- Other current scientific knowledge
- History and current pattern of abuse
- Scope, duration, and significance of abuse
- Public health risk
- Psychic or physiological dependence liability
- If it is an immediate precursor of a controlled substance

*Salvia divinorum* legislation might be difficult to police as the plant has a nondescript appearance nor, does it have a distinctive odour. It resembles a normal house plant and can be grown by hydroponics or high-powered lights.

Countries having some form of legal control include; Finland, Australia, Denmark, Spain, Italy, Sweden, Belgium, Croatia, Lithuania, Germany, Russia, Poland, and Romania.

- August 2002, *Finland* prohibited importation of *Salvia divinorum* without a prescription from a doctor.
- June 2002, *Australia* became the first country to ban *Salvia divinorum* and *salvinorin A*.
- August 2003, *Denmark* classed *Salvia divinorum* and *salvinorin A* as category B drugs in Danish law (same category as psilocybin mushrooms, cocaine, amphetamine, and other substances only legal for medicinal and scientific purposes).
- February 2004, *Spain* made the commerce of *Salvia divinorum* illegal. The use and possession thereof is not.
- March 2005 *Italy* placed both *Salvia divinorum* and *salvinorin A* on their Table I of outlawed psychotropic substances.
- April 2006, *Sweden* added *Salvia divinorum* and *salvinorin A* to their list of controlled substances.
- May 2006, *Salvia divinorum* was added to the *Belgian* list of illegal products.
- August 2007, *Chile* decreed the trafficking of *Salvia divinorum* and *salvinorin A* illegal.
- April 2008, *Salvia divinorum* was banned in *Croatia* by its addition to the official list of illegal substances and plants.
- May 2008, *Lithuania* banned the plant
- February 2008, banned in *Germany* by its addition to the official list of illegal substances.
- April 2009, sales and import of *Salvia divinorum* were banned in *Russia*.
- May 2009, *Poland* has made the sale, possession and consumption of *Salvia divinorum* illegal.
- February 2010, *Salvia divinorum* and *salvinorin A-F* were made illegal under Law 143/2000 in *Romania*.

No legal action has been taken in the *United Kingdom* regarding *Salvia divinorum*.

**Follow-up action:** Mr. Nathan Isotalo of the Office of Controlled Substances had returned Mrs. Steele's inquiry. There appears to be disagreement in the literature as to the potency of the drug, the intensity of its effects. Some claim that the plant can produce a more rapid and intense psychoactive high when compared with LSD whereas other researchers claim the opposite. Increased traffic at points of entry into Canada has prompted CBSA inspectorate to seize these plants at numerous border crossings.

Although unspecified by CBSA, in the international literature there appears to be an association of *Salvia divinorum* with *Salvinorin* or *Salvinorin A*.

**Recommendation:** Continue monitoring to determine whether Scheduling or regulatory action is required.

## Latest IYA on *Salvia divinorum*

### Issue

*Salvia divinorum* (*S. divinorum*) is a species of sage belonging to the mint family. Some street names for *S. divinorum* include: Sally D, Lady Sally, Maria pastora, ska Maria pastora, ska pastora, diviner's sage, magic mint, puff, incense special, and salvia.

Recently there have been reports suggesting that Canadian teens and young adults are using *S. divinorum* for its ability to produce hallucinations. Certain websites are also promoting the use of *S. divinorum* as a "legal" alternative to street drugs.

Health Canada recommends that you avoid using this plant because very little is known about the effects it may have on your body and/or brain. There is also no way to predict how it will affect you with each use.

**Comment [JK1]:** We are suggesting deletion of this para as it seems to introduce a whole lot of complex ideas that are then not fully explained until later in the article.....

### Background

*S. divinorum* is known to have psychotropic effects, which means it can affect the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience).

Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

### Risks Associated with the Use of *Salvia divinorum*

The effects of *S. divinorum*, which vary from person to person, are often described as unpleasant and may include the following:

- hallucinations;
- dysphoria (feeling unwell, uneasy or unhappy);
- out-of-body experiences;
- uncontrollable laughter;
- loss of consciousness;
- short-term memory loss;
- lack of physical coordination; and
- slurred speech and awkward sentence patterns.

There is no way to predict what effect this substance may have on you. In addition, the effects may differ from one use to the next, depending on factors such as:

- the potency of the product;
- how much is used;

- the purity of the product (it may be mixed with other substances);
- how it is taken (e.g., chewed, swallowed or smoked);
- the user's mood and expectations.

While scientists know which brain receptors are targeted by the active ingredient, salvinorin A, very little is known about the following:

- how it affects the brain overall, including whether there are any long-term effects or permanent damage;
- how it interacts with other substances, including other drugs, natural health products and alcohol.

The potential of *S. divinorum* to produce physical dependence and/or addiction is also not known.

### Minimizing Your Risk

Health Canada recommends that you avoid using *S. divinorum*. Just because a drug is plant-based or "natural", does not mean that it is safe.

Also, if you have children, talk to them about peer pressure and the risks of using illegal drugs and other substances that distort reality. (See the "Need More Info?" section below for links to resources that can help you with this.)

### Legal Status of *Salvia divinorum*

#### In Canada

When *S. divinorum* is manufactured, sold or represented for use in modifying organic functions in humans, and hallucinogens work by modifying organic functions in the brain, it meets the definition of a Natural Health Product (NHP) in accordance with the *Natural Health Products Regulations* and the definition of a drug under the *Food and Drugs Act*. It is illegal to sell NHPs in Canada unless they have been reviewed and approved by Health Canada and labelled with one of the following:

- a Natural Product Number (NPN); or
- a Drug Identification Number - Homeopathic Medicine (DIN-HM).

As of January 2010 no products containing *S. divinorum* have been approved by Health Canada. All unauthorized drugs and NHPs are subject to compliance and enforcement actions by the Department.

Neither *S. divinorum* nor salvinorin A are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). This is because there is not enough information available to determine whether regulation as a controlled substance is warranted. In an effort to collect more information about the use of *S. divinorum*, questions on it were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey (CADUMS) and the 2009

**Comment [JK2]:** Suggesting deletion of this info as it should come under Legal Status

**Comment [JK3]:** Just think we should keep this at the departmental level as people outside won't know what the HPFBI is necessarily.....

Ontario Student Drug Use and Health Survey (OSDUHS). The results from the 2009 OSDUHS were published on November 18, 2009 and indicate that among responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. Data from the Youth Smoking Survey was published on May 31, 2010 and indicate that 4.9% of responding students in Grades 7-12 have used *Salvia divinorum* at least once in the past year.

Data Data from these surveys and the 2009 edition of CADUMS (to be released in June 2010) will contribute to future decisions that Health Canada may make regarding the regulation of *S. divinorum* and/or its active ingredient. See the Need More Info? section below for more information on the surveys that are collecting information about *Salvia divinorum* use in Canada and for more detailed findings from the 2009 OSDUHS.

**Comment [JK4]:** This should be updated to reflect the fact that the YSS results are now released.....

#### In Other Countries

Several countries including but not limited to Australia, Belgium, Germany, Italy, Japan, etc., have placed controls on the import and/or sale of *S. divinorum* and/or salvinorin A.

In the United States, *S. divinorum* and salvinorin A are not regulated under the *Controlled Substances Act*, but a number of individual states have placed restrictions on their sale and/or import. For example, several states have made it illegal to manufacture, distribute, import/export, possess, use, buy and/or sell *S. divinorum* and/or salvinorin A to various degrees, while others have placed restrictions on distribution, e.g., no sales to anyone under the age of 18, etc.

#### **Background**

*S. divinorum* is known to have psychotropic effects, which means it affects the mind and mental processes. The leaves of this plant have been used traditionally by the Mazatec Indians for both medicinal purposes (chewing the leaves or using them to make a tea) and spiritual purposes (smoking the leaves to induce a "mystical" or hallucinogenic experience). Products that claim to contain *S. divinorum* – or its main active ingredient, salvinorin A – are widely available on the Internet and are sold in various "head shops" and natural food stores. The products are sold in a number of forms, including fresh or dried leaves, liquids or seeds and plant cuttings for growing purposes.

**Comment [JK5]:** We realize this may be a template issue but to us, these paras would make much more sense if they appeared earlier in the document as they provide some context for the article as a whole and where HC's interest in providing info to people about it

#### **Health Canada's Role**

Health Canada continues to collect and consider information regarding *S. divinorum* and will continue to consult with key stakeholders including health officials in other countries and law enforcement officials here at home. This will assist in determining Health Canada's future approach to decision-making regarding *S. divinorum*.

**Comment [D6]:** We are doing nothing to mitigate risk other than asking people not to use it.

Complaints about illegal sale of drugs containing *S. divinorum* can be made to the Health Products and Food Branch Inspectorate at 1-800-267-9675.

**Comment [D7]:** This sentence appears to be out of place as there is no reference anywhere in the article to Adverse Drug Reactions. For the purpose of context, perhaps there should be an opening line saying that HC is always interested in obtaining information about incidents of adverse effects?

#### **Reporting Adverse Reactions**

You can report any adverse reactions to the Canada Vigilance Program by one of the following three ways:

Report online at the MedEffect™ Canada Web site

Call toll-free at 1-866-234-2345

Complete a Canada Vigilance Reporting Form and either:

Fax toll-free to 1-866-678-6789

Mail to: Canada Vigilance Program

Health Canada

AL 0701C

Ottawa, ON K1A 0K9

To have postage pre-paid, download the postage paid label from the MedEffect™ Canada Web site. The Canada Vigilance Reporting Form and the adverse reaction reporting guidelines may also be obtained via this Web site.

#### 1. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

#### 2. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules of the CDSA, <sup>and</sup> in order to determine whether or not ~~*S. divinorum*, and/or salvinorin A~~, <sup>they</sup> should be regulated as controlled substances in Canada.

#### 3. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the

psychoactive ingredient in *S. divinorum*, which is also referred to chemically as a neoclerodane diterpene, is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalently marketed herbal dietary supplements available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required) and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD), of the Health Products and Food Branch (HPFB), prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinatorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinatorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk according to the Recall Policy of the Health Products and Food Branch Inspectorate (HPFBI), such a risk is defined as "a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote".

Further to an ADM discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFBI as a Type II substance. HPFBI was to determine compliance activities based on the HRA Type II classification and check with Canada Border Services Agency (CBSA) to determine if any further information regarding *S. divinorum* shipments was available.

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinatorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what is known about *S. divinorum* from a regulatory perspective and to reach consensus on next steps. It was determined that DSCSD would conduct a scheduling assessment of *S. divinorum* to explore the possibility of scheduling this substance under the CDSA.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinorum* and to determine an agreed upon approach for subsequent steps. It was decided that media lines and a proposal for an "It's Your Health" article on *S. divinorum* would be prepared, and circulated for comment.

### 3.1 Legislative Frameworks for Drug Control in Canada

#### 3.1.1 Food and Drug Regulations (under the Food and Drug Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality, and Health Canada reviews this information carefully. If the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoring, correcting or modifying organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of January 2010, it is illegal to ~~sell or represent~~ *S. divinorum* as a drug.

#### 3.1.2 Natural Health Product Regulations (under the Food and Drug Act)

The *Natural Health Products Regulations* (NHPR) came into force in January, 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the

NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore such products would be considered NHPs.

As of January 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada. Therefore sale of such a product is illegal under the NHPR.

and no NHPs or DIN-NMs have been issued

an unlicensed hallucinogen such as Salvia divinorum

### 3.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);

- Potential for abuse a
- Extent of actual abu

substances in any of the

#### **Australia**

In June, 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision. Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>3</sup>

Cite

#### **Belgium**

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances which includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>4</sup>

#### **Denmark**

In 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

#### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically

<sup>3</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>4</sup> <http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale i.e. (that beyond medical treatment or research purposes,) will be subject to up to five years imprisonment or to a fine of up to five million yen.

### **Spain**

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other allegedly "toxic" herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

→ other ~~European~~ countries.

In Estonia, Finland, Iceland and Norway *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules of the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale and/or distribution. As of May 2010, nineteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Hawaii, Illinois, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina, and Tennessee have enacted other forms of legislation restricting the distribution of the plant.

### **California**

For example, as of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no

more than \$1,000, or both.

### **Louisiana**

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### **Maine**

In Maine, *S. divinorum* and salvinorin A are regulated <sup>way similar to</sup> ~~similarly to how~~ tobacco products <sup>in a similar fashion as</sup> are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### **North Carolina**

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009. The new law came into effect on December 1, 2009.

### **Tennessee**

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the FDA as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has also placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implications.

### 3.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>5</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>6</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>7</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>8</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>9</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>10</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>11</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>12</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>13</sup>

### 3.2.3 Legitimate Uses of Salvia Divinorum

presently

There are no legitimate medical or industrial uses for *S. divinorum* in Canada.

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>14</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>15</sup> Its main use is however for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>16</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>17</sup> It has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder.<sup>18</sup> However, much more research is needed in order to substantiate these hypotheses. Another study has suggested that chemical analogues of salvinorin A may be a useful treatment for addiction to other substances.<sup>19</sup>

those suffering from

### 3.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>23</sup> because activation of the MORs causes euphoria, which makes the user want to take them again. As previously mentioned, salvinorin A

is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>24</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression. However, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>25</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>26</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. The onset of effect generally takes 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>27</sup>

Routes of administration that avoid the hepatic first-pass effect are the quickest and most intense.<sup>28</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500 micrograms of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effect felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>29</sup>

<sup>28</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

<sup>29</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

Smoking is by far the most popular method of administration<sup>30</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A, and/or a concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A are injected because the powder is insoluble in water.<sup>31</sup>

The various modes of administration of *S. divinorum* lead to the variable onset and duration of its effects. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), <sup>perceived</sup> loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>32</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>33</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering have also been reported.<sup>34</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. Therefore, <sup>it is difficult</sup> using <sup>these studies</sup> these studies to predict its potential for addiction and abuse is difficult. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect, and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>35</sup> More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also warranted.

Another aspect of the *S. divinorum* abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and

it is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling ~~the drug~~ <sup>this substance</sup> quite affordable and attractive. Originally the concerns for the abuse potential were minimal since it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>36</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, ~~even poor yields of a gram per kilograms of dried leaves would provide enough salvinorin A for~~ <sup>despite for</sup> 2000 human doses.<sup>37</sup> It is <sup>also</sup> believed to be easier to obtain salvinorin A than to extract LSD or produce PCP derivatives.<sup>38</sup> <sup>is enough</sup>

### 3.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the actual ~~population~~ use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% report using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) <sup>are</sup> significantly more likely than females (2.3%) to use *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were <sup>published</sup> ~~released~~ on May 31, 2010 and indicate that:

- 4.9% of students indicated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9, <sup>and</sup> 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and

<sup>36</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol.* 1994 Jun;43(1):53-6.

<sup>37</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. *J Psychoactive Drugs.* 1994 Jul-Sep;26(3):277-83.

<sup>38</sup> Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry.* 2005 Jan;38(1):1-5.

- Males (6.6%) <sup>were</sup> are more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. *Given the lack of information surrounding S.d. it is difficult to speculate what may have caused such differences.*

*Additional* Further data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey, will be available in the summer of 2010.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the CDS druglist, it is not possible to have records of any seizures of it in the database. However, there have been a number of samples submitted to DAS for analysis that have been confirmed to contain salvinorin A.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year Return Completed	Count
2006	6
2007	8
2008	6
2009	To be updated

The National Forensic Laboratory Information System (NFLIS) and the System to Retrieve Information from Drug Evidence (STRIDE) in the United States is a Drug Enforcement Agency (DEA) database that collects scientifically verified data on analyzed samples in state and local forensic labs as well as samples from DEA labs. The following table shows the quantity of *S. divinorum* products that were seized from 2000 through to 2009.

**ANALYZED SALVIA DIVINORUM or SALVINORIN A SEIZURES**

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

*A few* Two reports regarding the use of *S. divinorum* have been published in the academic literature.

~~The first was~~ <sup>One was</sup> an international case report in which a <sup>19-year-old</sup> young man (~~19 years of age~~) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>40</sup> ~~The second case~~ <sup>Another report</sup> involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech, after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be ~~considered~~ long-term effects of *S. divinorum* use.<sup>41</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>42</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passing a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>43</sup> However, another study suggested that this is ~~certainly~~ not the experience of all recreational users of *S. divinorum*.<sup>44</sup> ~~Moreover,~~ <sup>Over</sup> eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>45</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>46</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>47</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>48</sup> However, it is difficult to determine the influence these effects have on the use of *S.*

### 3.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise in Canada. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>49</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities, such as operating a motorized vehicle, may pose to the general public. There is also very little data regarding the toxicity, teratogenicity and long-term effects of *S. divinorum* use.<sup>50</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also neither received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like many drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>51</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were ~~were~~ falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* poses to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. This data can also not be used to determine incidence of use in the general Canadian population.

## 4. ASSESSMENT OF RISKS AND BENEFITS

---

*divinorum* among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>49</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>50</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

<sup>51</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

s.21(1)(a)

s.21(1)(b)

*Salvia divinorum* is a substance with unknown long term effects that is currently not scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not represented as a health product, and the *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards. The available scientific evidence indicates a low potential for abuse of this substance.

There are certain risks associated with ~~the~~ scheduling *Salvia divinorum* and/or salvinorin A under the CDSA. In particular, scheduling *S. divinorum* and/or salvinorin A under the CDSA without sufficient defensible evidence according to the established criteria for scheduling could be precedent-setting in that Health Canada might then have to look at scheduling other plants with psychoactive properties, e.g. Jimsonweed, Datura.

Health Canada only has anecdotal information about the risks associated with the use of *S. divinorum* and/or salvinorin A. However, there is scientific evidence which suggests that this plant and its active ingredient may have the potential to create risks to individual and public health and safety resulting from the unsupervised use of a hallucinogenic substance (i.e. driving under the influence, injuries caused by disassociation with surroundings, loss of consciousness, etc.). In the absence of any type of mechanism of control of these substances, the safety and well-being of Canadians could be at risk.

s.21(1)(b)

7. **CONSIDERATIONS** ← HPFB recommendations.

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>55</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>56</sup> Interestingly, after being widely available for over a decade, the drug has not had any extreme social impact as did LSD or MDMA.<sup>57</sup>

Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen. Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada. According to currently available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis.

*Salvia divinorum* meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that product's that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, the sale of such products is illegal. Several challenges also arise with respect to the importation and domestic movement of *S. divinorum* products as they are often declared as incense and therefore cannot be considered unapproved natural health products. r seized.

In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and/or pharmacological effects. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above.

*S. divinorum* and salvinorin A are not structurally similar or even pharmacologically similar to other substances included in the schedules to the CDSA. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of the physical

and psychotropic effects of *S. divinorum* have been carried out on humans. More controlled systematic research in this area is needed. Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding usage in Canada.

Health Canada is currently finalizing media lines regarding *S. divinorum* as well as an "It's Your Health" article to be published on the Health Canada website. These documents are designed to address the recurrent media attention regarding *S. divinorum* as well as increase public awareness of the risks associated with this substance as well as what Health Canada is doing to safeguard the health of Canadians.

#### 1. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

#### 2. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules of the CDSA, and determine whether or not they should be regulated as controlled substances in Canada.

#### 3. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is

known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalent herbal products available for use as an alternative to illicit drugs of abuse among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required), and involving the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

re serious ADR report

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as a controlled substance (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HPFBI). Such a risk is defined as "a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote".

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFBI as a Type II substance based on its Health Hazard Classification. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and check with Canada Border Services Agency (CBSA) to determine if any further

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

[http://www.deadiversion.usdoj.gov/drugs\\_concern/salvia\\_d/salvia\\_d.htm](http://www.deadiversion.usdoj.gov/drugs_concern/salvia_d/salvia_d.htm) Nov 2008

<sup>2</sup> Dennehy CE, Tsourounis C, Miller AE. Evaluation of Herbal Dietary Supplements Marketed on the Internet for Recreational Use. *Annals of Pharmacotherapy*. 2005 Oct;39(10):1634-9.

information regarding *S. divinorum* shipments was available.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what was known about *S. divinorum* from a regulatory perspective and to reach consensus on the next steps. It was determined that DSCSD would conduct a scheduling assessment of *S. divinorum* to explore the possibility of scheduling this substance under the CDSA.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinorum* and to determine an agreed upon approach for subsequent steps. It was decided that media lines and a proposal for an "It's Your Health" article on *S. divinorum* would be prepared.

### **3.1 Legislative Frameworks for Drug Control in Canada**

#### **3.1.1 Food and Drug Regulations (under the Food and Drug Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality. Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in :

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoring, correcting or modifying organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of January 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **3.1.2 Natural Health Product Regulations (under the Food and Drug Act)**

The *Natural Health Products Regulations* (NHPR) came into force in January 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a

Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. The number is issued once a (NHPR) product is authorized for sale in Canada by the Natural Health Products Directorate. Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore such products would be considered NHPs.

As of January 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sale of an unlicensed hallucinogen such as *S. divinorum* is illegal under the NHPR.

### 3.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

### **3.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

#### **3.2.1 International Requirements and Trends in Control/Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

#### ***Australia***

In June 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances which includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

#### ***Denmark***

---

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM.%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

In 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs will be banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale (that beyond medical treatment or research purposes) will be subject to up to five years imprisonment or to a fine of up to five million yen.

### ***Spain***

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other allegedly toxic herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules of the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale

and/or distribution. As of May 2010, nineteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Hawaii, Illinois, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina, and Tennessee have enacted other forms of legislation restricting the distribution of the plant.

### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in a way similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. ~~The amended version passed the Senate unanimously on May 14, 2009, the House approved it on August 5, 2009 and it was signed into law on August 28, 2009.~~ The new law came into effect on December 1, 2009.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has ~~also~~ placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implications.

### 3.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>9</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>10</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to

<sup>8</sup> Roth BL, Baner K, Westkaemper R, Siebert D, Rice KC, Steinberg S, Ernsberger P, Rothman RB. Salvinorin A: a potent naturally occurring nonnitrogenous kappa opioid selective agonist. *Proc Natl Acad Sci U S A*. 2002 Sep 3;99(18):11934-9.

<sup>9</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>10</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. *J Ethnopharmacol*. 1994 Jun;43(1):53-6.

those caused by psilocybin mushrooms.<sup>11</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>12</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>13</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>14</sup>

### 3.2.3 Legitimate Uses of Salvia Divinorum

There are presently no legitimate medical or industrial uses for *S. divinorum* in Canada.

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>15</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>16</sup> Its main use is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>17</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>18</sup> It has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder.<sup>19</sup> However, much more research is needed in

order to substantiate these hypotheses. Another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>20</sup>

### 3.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>24</sup> because activation of the MORs causes euphoria, which makes the user want to take them again. As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>25</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression. However, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>26</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>27</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and

chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time the material spends in the mouth. The onset of effect generally takes 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>28</sup>

Routes of administration that avoid the hepatic first-pass effect are the quickest and most intense.<sup>29</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500 micrograms of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>30</sup> Smoking is by far the most popular method of administration<sup>31</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A are injected because the powder is insoluble in water.<sup>32</sup>

The various modes of administration of *S. divinorum* lead to the variable onset and duration of its effects. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>33</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>34</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering have also been reported.<sup>35</sup>

<sup>34</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend.* 2006 Nov 8;85(2):157-62.

<sup>35</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage).

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>36</sup> More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also warranted.

Another aspect of the *S. divinorum* abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and it is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling this substance quite affordable and attractive. Originally the concerns for the ~~abuse potential~~<sup>for abuse</sup> were minimal ~~since~~<sup>as</sup> it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>37</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. ~~Therefore, despite poor yields,~~<sup>to provide</sup> a gram of salvinorin A is enough substance for 2000 human doses.<sup>38</sup> It is also believed to be easier to obtain salvinorin A than to extract LSD or produce PCP derivatives.<sup>39</sup>

### 3.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

<sup>38</sup> Valdès LJ 3rd. *Salvia divinorum* and the unique diterpene hallucinogen, Salvinorin (divinorin) A. J Psychoactive Drugs. 1994 Jul-Sep;26(3):277-83.

<sup>39</sup> Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students <sup>stated</sup> indicated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. Given the lack of information surrounding *S. divinorum*, it is difficult to speculate on the causality of such differences.

Additional data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey will be available in the summer of 2010.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the Controlled Drugs and Substances Database (CDS) druglist, it is not possible to have records of any seizures of it in the database. However, there have been a number of samples submitted to DAS for analysis that have been confirmed to contain salvinorin A.

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>41</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>42</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>43</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passing a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

<sup>42</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

<sup>43</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup> However, it is difficult to determine the influence these effects have on the use of *S. divinorum*.

### 3.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise in Canada. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity and long-term effects of *S. divinorum*

<sup>47</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>48</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of Salvia divinorum (Diviner's Sage). Pharmacopsychiatry. 2005 Jan;38(1):1-5.

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of Salvia divinorum among recreational users. Drug Alcohol Depend. 2006 Nov 8;85(2):157-62.

<sup>50</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

use.<sup>51</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also neither received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose risks to health. For example, like many drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>52</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products were ~~were~~ <sup>were</sup> falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. This data can also not be used to determine incidence of use in the Canadian population.

#### 4. ASSESSMENT OF RISKS AND BENEFITS

*Salvia divinorum* is a substance with unknown long term effects that is currently not scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not represented as a health product. The *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards. The available scientific evidence indicates a low potential for abuse of this substance.

There are certain risks associated with scheduling *Salvia divinorum* and/or salvinorin A under the CDSA. In particular, scheduling *S. divinorum* and/or salvinorin A under the CDSA without sufficient defensible evidence <sup>in accordance with</sup> according to the established criteria for scheduling could be precedent-setting in that Health Canada might then have to look at scheduling other plants with psychoactive properties, e.g. Jimsonweed, Datura.

Health Canada only has anecdotal information about the risks associated with the use of *S. divinorum* and/or salvinorin A. However, there is scientific evidence which suggests that this plant and its active ingredient may have the potential to create risks to individual and public health and safety resulting from the unsupervised use of a hallucinogenic substance (i.e. driving under the influence, injuries caused by disassociation with surroundings, loss of consciousness, etc.). In the absence of any type of mechanism of control of these substances, the safety and well-being of Canadians could be at risk.

## 6. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the prevalence of *S. divinorum* in Canada. Though DAS did not have a record of seizures of the substance, it did provide information regarding the number of samples DAS tested which contained salvinorin A.

???

The OCS contacted the Royal Canadian Mounted Police (RCMP) in order to establish their views on *S. divinorum* use in Canada. The RCMP indicated that *Salvia divinorum* is not yet a known substance in the majority of Canada (with the exception of Ontario), and that it does not pose a significant concern for public safety at this time. An RCMP document prepared by Sgt. Doug Culver stated that scheduling of *S. divinorum* under the CDSA was not currently warranted due to its low potential for abuse and potential medical significance.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the substance should be treated at the border. Officers also expressed concern regarding the substances hallucinogenic properties and increased media attention. At present, only shipments of *S. divinorum* that are represented as health products/ hallucinogens can be refused for import under the NHPR.

## 7. CONSIDERATIONS

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased

#### 1. ISSUE

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

#### 2. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules of the CDSA, and determine whether or not they should be regulated as controlled substances in Canada.

#### 3. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is

known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops, and alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances (a recommendation that was maintained when the IAS was updated in November 2006).

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale. Such products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HPFBI). Such a risk is defined as "a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote".

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and the Inspectorate of HPFB (HPFBI) to discuss *S. divinorum*. At that time, it was decided that *S. divinorum* would be classified by HPFBI as a Type II substance based on its Health Hazard Classification. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and check with Canada Border Services Agency (CBSA) to determine if any further

information regarding *S. divinorum* shipments was available.

On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what was known about *S. divinorum* from a regulatory perspective and to reach a consensus on the next steps. It was determined that DSCSD would conduct a scheduling assessment of *S. divinorum* to explore the possibility of scheduling this substance under the CDSA.

The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinorum* and to determine an agreed upon approach for subsequent steps. It was decided that media lines and a proposal for an "It's Your Health" article on *S. divinorum* would be prepared.

### **3.1 Legislative Frameworks for Drug Control in Canada**

#### **3.1.1 Food and Drug Regulations (under the Food and Drug Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of a product's safety, efficacy and quality. Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of January 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

#### **3.1.2 Natural Health Product Regulations (under the Food and Drug Act)**

The *Natural Health Products Regulations* (NHPR) came into force in January 2004 to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a

Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate (NHPD). Product authorization requires either reference to a *natural health product monograph* or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore such products would be considered NHPs.

As of January 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of an unlicensed hallucinogen such as *S. divinorum* is illegal under the NHPR if claims are made regarding its hallucinogenic properties or other similar claims for human consumption (e.g. modification of an organic function).

### 3.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular penalties as described in Part I of the CDSA.

offences and.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

### **3.2 Assessment of *Salvia Divinorum* for Scheduling Purposes**

#### **3.2.1 International Requirements and Trends in Control/Scheduling**

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these conventions.

#### ***Australia***

In June 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### ***Belgium***

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances which includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

#### ***Denmark***

---

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/tr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

In 2003, Denmark prohibited *S. divinorum* and salvinorin A by adding them to their list of “category B” controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### ***Germany***

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### ***Italy***

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in “*Tabella 1*” of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### ***Japan***

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale (that beyond medical treatment or research purposes) will be subject to up to five years imprisonment or a fine of up to five million yen.

### ***Spain***

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, along with a long list of other allegedly toxic herbs. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### ***Other Countries***

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules of the United States *Controlled Substances Act*, although some individual states have implemented laws restricting its use, sale

and/or distribution. As of May 2010, nineteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A. Delaware, Florida, Hawaii, Illinois, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

California, Louisiana, Maine, North Carolina, and Tennessee have enacted other forms of legislation restricting the distribution of the plant.

### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in a way similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes; the other allows for university-affiliated medical or pharmacological research. The new law came into effect on December 1, 2009.

### ***Tennessee***

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug.

In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern," without legal implications.

### 3.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>9</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>10</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>11</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and

overall experience is quite unique.<sup>12</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>13</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>14</sup>

### 3.2.3 Legitimate Uses of Salvia *Divinorum*

There are presently no legitimate medical or industrial uses for *S. divinorum* in Canada.

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>15</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>16</sup> Its main use is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>17</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>18</sup> It has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder.<sup>19</sup> However, much more research is needed in order to substantiate these hypotheses. Another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>20</sup>

### 3.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming<sup>24</sup> because activation of the MORs causes euphoria, which makes the user want to take them again. As previously mentioned, salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>25</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression. However, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>26</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>27</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration. Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. These methods rely on contact with the oral mucosa for absorption and the level of effect relates quite closely to the length of time

the material spends in the mouth. The onset of effect generally takes 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>28</sup>

Routes of administration that avoid the hepatic first-pass effect are the quickest and most intense.<sup>29</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. This method of administration is the most powerful and only requires 200-500 micrograms of salvinorin A powder to produce the same effects as those of fresh leaves. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>30</sup> Smoking is by far the most popular method of administration<sup>31</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A are injected because the powder is insoluble in water.<sup>32</sup>

The various modes of administration of *S. divinorum* lead to the variable onset and duration of its effects. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>33</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>34</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering have also been reported.<sup>35</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and

psychotropic effects of *Salvia divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>36</sup> More controlled systematic research in this area is needed. Further studies on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also warranted.

Another aspect of the *S. divinorum* abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and it is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling this substance quite affordable and attractive. Originally, the concerns for the potential of abuse were minimal as it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>37</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, a gram of salvinorin A is enough substance to provide for 2000 human doses.<sup>38</sup> It is also believed to be easier to obtain salvinorin A than to extract LSD or produce PCP derivatives.<sup>39</sup>

### 3.2.5 Extent of Actual Abuse in Canada and Internationally

Very limited data exists regarding the population use of *Salvia divinorum* across the Canadian population. To address this lack of data, questions about the use of *S. divinorum* were included

<sup>39</sup> Bucheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. Given the lack of information surrounding *S. divinorum*, it is difficult to speculate on the causality of such differences.

Additional data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey will be available in the summer of 2010.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety.

*Should we qualify this? Significant?*

Health Canada's Drug Analysis Services (DAS) has collected some raw data regarding the number of samples identified as containing salvinorin A in the DAS labs, however, as the plant and/or substance is not in the Controlled Drugs and Substances Database (CDS) druglist, it is not possible to have records of any seizures of it in the database. However, there have been a number of samples submitted to DAS for analysis that have been confirmed to contain salvinorin A.

Data Source: NFLIS & STRIDE, 2008 data queried 11/24/08, updated 06/10/2010

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>41</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>42</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>43</sup> It should be noted that alcohol and general depression were the main confounders in this case.

<sup>42</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

<sup>43</sup> <http://www.kvbc.com/Global/story.asp?S=4893692>

After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup> However, it is difficult to determine the influence these effects have on the use of *S. divinorum*.

### 3.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise in Canada. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding

<sup>44</sup> Turner DM. Salvinorin - The Psychedelic Essence of Salvia Divinorum. Panther Press, San Francisco, CA 1996.

<sup>50</sup> Siebert DJ. Salvia divinorum and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity and long-term effects of *S. divinorum* use.<sup>51</sup>

As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also neither received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose health risks. Like many drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>52</sup>, showed that the salvinin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. This data can also not be used to determine incidence of use in the Canadian population.

#### 4. ASSESSMENT OF RISKS AND BENEFITS

*Salvia divinorum* is a substance with unknown long term effects that is currently not scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not represented as a health product. The *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards. The available scientific evidence indicates a low potential for abuse of this substance.

There are certain risks associated with scheduling *Salvia divinorum* and/or salvinin A under the CDSA. In particular, scheduling *S. divinorum* and/or salvinin A under the CDSA without sufficient defensible evidence in accordance with the established criteria for scheduling could be precedent-setting in that Health Canada might then have to look at scheduling other plants with psychoactive properties, e.g. Jimsonweed, Datura.

Health Canada only has anecdotal information about the risks associated with the use of *S. divinorum* and/or salvinin A. However, there is scientific evidence which suggests that this plant and its active ingredient may have the potential to create risks to individual and public health and safety resulting from the unsupervised use of a hallucinogenic substance (i.e. driving under the influence, and injuries caused by disassociation with surroundings, loss of consciousness, etc.). In the absence of any type of mechanism of control of these substances, the

## 6. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the prevalence of *S. divinorum* in Canada. Though DAS did not have a record of seizures of the substance, it did provide information regarding the number of samples DAS tested which contained salvinorin A.

???

The OCS contacted the Royal Canadian Mounted Police (RCMP) in order to establish their views on *S. divinorum* use in Canada. The RCMP indicated that *Salvia divinorum* is not yet a known substance in the majority of Canada (with the exception of Ontario), and that it does not pose a significant concern for public safety at this time. An RCMP document prepared by Sgt. Doug Culver stated that scheduling of *S. divinorum* under the CDSA was not currently warranted due to its low potential for abuse and potential medical significance.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the substance should be treated at the border. Officers also expressed concern regarding the substances hallucinogenic properties and increased media attention. At present, only shipments of *S. divinorum* that are represented as health products/ hallucinogens can be refused for import under the NHPR.

## 7. CONSIDERATIONS

*S. divinorum*'s KOR-mediated aversive and dysphoric effects do not appear to be hampering its use. Young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased

has an approvals section and Recommendation vs. Selected strategy I think

1. ISSUE *neither of which are currently*

In Canada, neither the herb *Salvia divinorum* (*S. divinorum*) nor its main active ingredient, salvinorin A, are regulated under the *Controlled Drugs and Substances Act* (CDSA). Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum* and/or its particularly given reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

② These requests are largely based on further to

2. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules of the CDSA, and determine whether ~~or not they~~ should be regulated as controlled substances in Canada.

*one or both*

3. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is

known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" alternative to street drugs on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops ~~and~~ <sup>or</sup> alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. ~~That~~ <sup>This</sup> recommendation ~~that~~ was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products ~~should be restricted from over-the-counter use. Should any such (unauthorized) health products be found on the Canadian market, they should be removed from sale.~~ Such products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as "a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote".

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and the ~~Inspectorate of HPFB (HPFBI)~~ to discuss *S. divinorum*. ~~At that time, it was decided that *S. divinorum* would be classified by HPFB as a Type II substance based on its Health Hazard Classification.~~ HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and ~~check with the Canada Border Services Agency (CBSA) to determine if any~~ <sup>consult</sup> ~~regarding the~~

<sup>1</sup> U.S. Department of Justice Drug Enforcement Administration. 2002. Drugs and Chemicals of Concern: Salvia Divinorum (salvinorin A, divinorin A) URL:

~~movement of products containing further information regarding *S. divinorum* shipments was available.~~ <sup>into and out of Canada.</sup>

~~On September 13, 2007, a meeting was organized between DSCSD, MHDP, NHPD and HPFBI to discuss what was known about *S. divinorum* from a regulatory perspective and to reach a consensus on the next steps. It was determined that DSCSD would conduct a scheduling assessment of *S. divinorum* to explore the possibility of scheduling this substance under the CDSA.~~ <sup>a further</sup>

led to the conclusion that in September, 2008,

~~The Director Generals of DSCSD, MHPD, TPD and the HPFBI also met on September 26, 2008 to discuss an update on issues relating to *S. divinorum* and to determine an agreed upon approach for subsequent steps. It was decided that media lines and a proposal for an "It's Your Health" article on *S. divinorum* would be prepared.~~ <sup>in order</sup>

<sup>Relevant</sup>  
3.1 ~~Legislative Frameworks for Drug Control in Canada~~

Act is "drugs"  
Regs are "drug"

3.1.1 Food and Drug Regulations (under the Food and Drug Act)

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence of ~~that a~~ <sup>is</sup> product's safety, efficacy <sup>is of high</sup> and quality. Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned. <sup>For drugs,</sup>

A "drug" is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of ~~January~~ <sup>July</sup> 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

3.1.2 Natural Health Product Regulations (under the Food and Drug Act)

The *Natural Health Products Regulations* (NHPR) ~~came into force in January 2004~~ <sup>in</sup> to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR contain a product licensing system that requires that all licensed products display a

These  
for the  
Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. The number is issued once a product is authorized for sale in Canada by the Natural Health Products Directorate (NHPD). Product authorization requires either reference to a natural health product monograph or submission of other evidence of safety and health claim. A system of site licensing is also included in the NHPR which requires that all manufacturers, packagers, labellers, and importers be licensed; sites have procedures in place respecting distribution records, and product recalls; where applicable, sites have procedures in place for the handling, storage and delivery of their products, and sites meet good manufacturing practice requirements.

which in turn requires the presence of  
The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore such products would be considered NHPs.

containing it meet the definition of an  
As of January 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims such as modifying of organic functions are made.

### 3.1.3 Controlled Drugs and Substances Act and its Regulations

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in control/scheduling;
- Chemical and pharmacological similarity to other substances already scheduled under the CDSA;
- Legitimate uses of the substance (i.e. therapeutic, industrial or commercial);
- Potential for abuse and/or addiction liability of the substance;
- Extent of actual abuse in Canada and internationally; and
- Overall risk to public health and safety of Canadians.

pls confir that these are later factor (Trans-Schedulr policy - doc)

### 3.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

#### 3.2.1 International Requirements and Trends in Control/Scheduling

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### *Australia*

In June 2002, Australia became the first country to prohibit *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed on Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

prohibit what sale, import?

#### *Belgium*

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances, which includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

This list

#### Denmark

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BELGIUM:%20New%20substances%20controlled%20include%20mCPP%20and%20khat>

In 2003, Denmark <sup>added</sup> ~~prohibited~~ *S. divinorum* and salvinorin A ~~by adding them~~ to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, *i.e.*, ~~that~~ beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004 the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*, ~~along with a long list of other allegedly toxic herbs~~. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

### **United States of America**

*S. divinorum* and salvinorin A are not included in the Schedules of the United States *Controlled*

although it has added ~~it to a list of chemicals~~ *Salvia divinorum* A  
do we need to update this:

In addition

*Wisconsin*  
Substances Act, although some individual states have implemented laws restricting its use, sale and/or distribution. As of May 2010, nineteen states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A, <sup>including</sup> Delaware, Florida, Hawaii, Illinois, Kansas, Kentucky, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota and Virginia have placed *S. divinorum* and/or salvinorin A into Schedule I of state law.

of iron which has no legal implicat

California, Louisiana, Maine, North Carolina, and Tennessee have enacted other forms of legislation restricting the distribution of the plant.

More details on the regulations *Salvia Divinorum* in these last five states is provided below

**California**

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age became a misdemeanor in the state of California that is now punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

**Louisiana**

and that

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption which contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of the forty plants listed, which includes *S. divinorum*.

a plant on a list of

**Maine**

In Maine, *S. divinorum* and salvinorin A are regulated in a way similar to how tobacco products are controlled. Adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

the same way as

**North Carolina**

December 1, 2009

the possession of

On February 11, 2009, Senate Bill 138 was introduced to the North Carolina State Legislature which sought to make *Salvia divinorum* and salvinorin A Schedule I controlled substances in that state. This bill was later amended to make possession of *S. divinorum* an infraction, a minor crime punishable by a maximum \$25 fine. A third possession offence would be charged as a misdemeanor. There are no separate penalties for manufacturing or sales. This bill includes two exemptions. One permits growing the plant for aesthetic, landscaping, or decorative purposes, the other allows for university-affiliated medical or pharmacological research. The new law came into effect on December 1, 2009.

illegal

brought a new law into force which

The only legal activities with *S. divinorum* are the growing for

## Tennessee

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug.

*moved to earlier* In addition, the U.S. Department of Justice Drug Enforcement Agency (DEA) has placed *S. divinorum* and salvinorin A on a list of drugs and chemicals "of concern" without legal implications.

### 3.2.2 Chemical and Pharmacological Similarity to Other Substances Listed in the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>9</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>10</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>11</sup> However, users familiar with the effects of other

hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>12</sup>

In addition, the <sup>a</sup>psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually <sup>a</sup>high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>13</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>14</sup>

### 3.2.3 Legitimate Uses of Salvia Divinorum

3 That said,

There are presently no legitimate medical ~~or industrial uses~~ for *S. divinorum* in Canada.

1 *Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>15</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the stomach.<sup>16</sup> Its main use ~~is~~ however, for its psychoactive properties in the aid of producing "mystical" or hallucinogenic experiences as part of spiritual rituals.<sup>17</sup>

2 Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>18</sup> <sup>today is</sup> It has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer's disease, schizophrenia, dementia and bipolar disorder.<sup>19</sup> <sup>In addition, while</sup> However, much more research is needed in order to substantiate these hypotheses. <sup>Similarly,</sup> Another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>20</sup>

④ Similarly,

There are no known industrial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale do so in the context of growing the plant for its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal.

### 3.2.4 Potential for Abuse Liability and/or Addiction Liability of the Substance

~~Most clinically used opioid analgesics (e.g. codeine, oxycodone, morphine) are selective for the  $\mu$ -opioid receptor (MOR) and can be habit-forming because activation of the MORs causes euphoria, which makes the user want to take them again. As previously mentioned, Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by MOR agonists, the KOR agonists are negatively reinforcing and aversive.<sup>22</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Initially, these effects provided hope for the development of an analgesic absent of addiction liability and respiratory depression. However, it was soon discovered that KOR agonists produced dysphoria and psychomimetic effects such as confusion, hallucinations and depersonalization.<sup>23</sup> Finally, while MOR increases the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>24</sup>~~

chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. ~~These methods rely on contact with the oral mucosa for absorption and~~ the level of effect relates quite closely to the length of time the material spends in the mouth. ~~The~~ onset of effect generally takes 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>25</sup>

Hence

Routes of administration that avoid the hepatic first-pass effect, are the quickest and most intense.<sup>26</sup> [Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled.] ~~This method of administration is the most powerful and only requires 200-500 micrograms of salvinorin A powder to produce the same effects as those of fresh leaves.~~ The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>27</sup> Smoking is by far the most popular method of administration<sup>28</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A are injected because the powder is insoluble in water.<sup>29</sup>

with the [ ] i.e., there

start new par

~~The various modes of administration of *S. divinorum* lead to the variable onset and duration of its effects.~~ These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>30</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>31</sup> Depersonalization, speaking gibberish, widening of consciousness, subjective illusions of rapid movement, flying or hovering have also been reported.<sup>32</sup>

out of place as reality more about effects not just addiction liability

may be work into 3.2.2

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>33</sup> ~~More controlled systematic research in this area is needed.~~ Further studies on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also warranted.

in this area and

required. While

~~Another aspect of the *S. divinorum* abuse potential stems from its availability. As previously mentioned, it is widely available for purchase on the Internet through drug promotional sites and it is also sold in various "head shops" and corner stores. In addition, the potential for high yields and ease of extraction may make buying and selling this substance quite affordable and attractive. Originally, the concerns for the potential of abuse were minimal as it was concluded that 1 kg of dried leaves yielded only 3 to 6 human doses of salvinorin A. However, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>34</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated. Therefore, a gram of salvinorin A is enough substance to provide for 2000 human doses.<sup>35</sup> It is also believed to be easier to obtain salvinorin A than to extract LSD or produce PCP derivatives.<sup>36</sup>~~

but we have no evidence of abuse b/c easy to buy!

which is enough

3.2.5 Extent of Actual Abuse in Canada and Internationally

move to next pg.

have to be honest and say am not sure this info is really relevant (but leave for now)

All of this is not extent of abuse but use check - ElizD. to see how this info handled for B21

Very limited data exists regarding the ~~population use~~<sup>use</sup> of *Salvia divinorum* ~~across the Canadian population~~<sup>in Canada</sup>. To address this lack of data, questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. ~~Given the lack of information surrounding *S. divinorum*~~, it is difficult to speculate on the causality of such differences.

In this regard,

Additional data from the 2009 Canadian Alcohol and Drug Use Monitoring Survey will be available in the summer of 2010.

this is on the website raw so its add.

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these ~~have~~<sup>has</sup> advised that the use of *S. divinorum* poses any threat to public safety. ~~Sgt. Doug Culver~~<sup>has</sup> of the Royal Canadian Mounted Police (RCMP) stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, ~~Sgt. Culver speculated that this may be~~<sup>probably</sup> due to its aversive effects such as anxiety and introversion.

Health Canada's Drug Analysis Services (DAS) has ~~collected some raw data~~<sup>a number of samples</sup> regarding the number of samples identified as containing salvinorin A in the DAS labs, however, ~~as the plant~~<sup>received</sup> seized by

<sup>1</sup> NFLIS reported seizures of *Salvia divinorum* and/or salvinorin A

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>37</sup> Another report involved a 15-year-old male who presented to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>38</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to

Again

<sup>38</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>39</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

It is difficult to determine the extent of actual abuse of *S. divinorum* as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>40</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>41</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>42</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the experience, persisting negative effects (most often anxiety)<sup>43</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>44</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>45</sup> ~~However, it is difficult to determine the influence these effects have on the use of *S. divinorum*.~~ *in Canada or elsewhere*

### 3.2.6 Overall Risk to Public Health and Safety of Canadians

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise in Canada. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the

hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>46</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities such as operating a motorized vehicle may pose to the general public. There is also very little data regarding the toxicity, teratogenicity and long-term effects of *S. divinorum* use.<sup>47</sup>

or other

~~As stated earlier, there are no approved medical uses for *S. divinorum* in Canada. Health Canada has also neither received nor approved any submissions for natural health products for sale in Canada. Therefore, products that claim to contain this substance have not been extensively reviewed by Health Canada and as such, may be counterfeit or may contain other ingredients that may pose health risks. Like many drugs of abuse, the users are often unaware of the potency and adulterants in the products they are purchasing. A study by Wolowich *et al.* (2006)<sup>48</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).~~

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population. ~~This data can also not be used to determine incidence of use in the Canadian population.~~

stet.

#### 4. ASSESSMENT OF RISKS AND BENEFITS

In addition,

*Salvia divinorum* is a substance with unknown long term effects that is currently not scheduled under the CDSA. It can be imported and sold legally in Canada to anyone of any age, anywhere in Canada provided it is not represented as a health product. The *S. divinorum* sold in Canada is currently not subject to any specific quality or safety standards. The available scientific evidence indicates a low potential for abuse of this substance.

good but put at end of section

There are certain risks associated with scheduling *Salvia divinorum* and/or salvinorin A under the CDSA. In particular, scheduling *S. divinorum* and/or salvinorin A under the CDSA without sufficient defensible evidence in accordance with the established criteria for scheduling could be precedent-setting in that Health Canada might then have to look at scheduling other plants with psychoactive properties, e.g. Jimsonweed, Datura.

Health Canada only has anecdotal information about the risks associated with the use of *S.*

<sup>46</sup> Siebert DJ. *Salvia divinorum* and salvinorin A: new pharmacologic findings. J Ethnopharmacol. 1994 Jun;43(1):53-6.

<sup>47</sup> Grundmann O, Phipps SM, Zadezensky I, Butterweck V. *Salvia divinorum* and Salvinorin A: An Update on Pharmacology and Analytical Methodology. Planta Med 2007 Jun;73:1039-1046.

<sup>48</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. Pharmacotherapy. 2006 Sep;26(9):1268-72.

reward to fows on last sentence ...

however

*divinorum* and/or salvinorin A. ~~However~~, there is scientific evidence which suggests that this plant and its active ingredient may have the potential to create risks to individual and public health and safety resulting from the unsupervised use of a hallucinogenic substance (i.e. driving under the influence, and injuries caused by disassociation with surroundings, loss of consciousness, etc.). In the absence of any type of mechanism of control of these substances, the safety and well-being of Canadians could be at risk.

is shouldn't be statements about this and Risk to Public Safety ?

### 5. IDENTIFICATION AND ANALYSIS OF OPTIONS

Further to the assessment previously described, the following options for the control of *Salvia divinorum* have been identified.

#### Option 1: Status Quo – No Action. *Salvia divinorum* and salvinorin A remain as uncontrolled substances.

~~*S. divinorum* and salvinorin A are considered to be unapproved natural health products according to the NHPR.~~

#### PROS:

- a. Consistent with the fact that *Salvia divinorum* and salvinorin A are not yet scheduled under any of the United Nations Drug Control Conventions
- b. When *S. divinorum* is manufactured, sold or represented for use as a hallucinogen it meets the definition of a drug under the *Food and Drug Act* (FDA) and cannot be sold legally without license authorization. Therefore, the sale of *Salvia divinorum* and salvinorin A is already subject to compliance action when they are represented as hallucinogens

is in itself a pro

- c. ~~A lack of action at this time is~~ consistent with the fact that <sup>very</sup> little is known about *S. divinorum* to ~~make an informed decision regarding changes to its regulation.~~ and for Salvinorin A

#### CONS:

- a. *S. divinorum* can be legally imported and sold in Canada providing it is not represented as a drug product (hallucinogen). This may allow for easier access to the substance by ~~potential abusers~~ and can only be applied
- b. Penalties under the FDA are only administrative in nature, ~~Law enforcement personnel do not have the authority to criminally charge non-compliant retailers~~ in the instance where
- c. ~~By not scheduling *S. divinorum* as a controlled substance, the Canadian mechanism of control differs from that of other countries including Australia, Belgium, Denmark, and Japan~~ <sup>status in</sup> <sub>(e.g.)</sub> a product is active in markets as
- d. ~~Is not~~ in line with the HPFB (MHPD, NHPD) recommendations to schedule *S. divinorum* under the CDSA <sup>as</sup> modifying organic reactions

Out of step with

#### Option 2: Develop and implement an educational campaign regarding the risks associated with the use of *Salvia divinorum*.

#### PROS:

- a. Consistent with the fact that *Salvia divinorum* and salvinorin A are not yet scheduled under any of the UN Drug Control Conventions
- b. Information provided may help individuals make an informed decision based on the

- placement of Salvia use stats

- legitimate use?

- extent of actual abuse?

- placement of DAS seizures &  
DEA info

- currently in extent of abuse

- same as BZP IAS

- specific schedule under CDSA?

- add sentence re: 3-step approach

(to schedule, which schedule, which reg)

- Schedule III - LSD, PCP, mushrooms

- Schedule IV - benzos, steroids (less stringent)

- Schedule I - Narcotics (opium, cocaine)

(II - cannabis) (VI - precursor) (V - propylhexedrine)

**Page(s) 000901 to\à 000901**

**Is(Are) exempted pursuant to section(s)  
est(sont) exemptée(s) en vertu de(s)(l')article(s)**

**21(1)(a), 21(1)(b)**

**of the Access to Information Act  
de la Loi sur l'accès à l'information**

6. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the prevalence of *S. divinorum* in Canada. Though DAS did not have a record of seizures of the substance, it did provide information regarding the number of samples DAS tested which contained salvinorin A. *the identity of samples submitted by law enforcement*

The OCS contacted the Royal Canadian Mounted Police (RCMP) in order to establish their views on *S. divinorum* use in Canada. The RCMP indicated that *Salvia divinorum* is not yet a known substance in the majority of Canada (with the exception of Ontario), and that it does not pose a significant concern for public safety at this time. An RCMP document prepared by Sgt. Doug Culver stated that scheduling of *S. divinorum* under the CDSA was not currently warranted due to its low potential for abuse and potential medical significance. *was contacted in order to determine if there was any mention of names of plants*

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the substance should be treated at the border. Officers also expressed concern regarding the substance's hallucinogenic properties and increased media attention. At present, only shipments of *S. divinorum* that are represented as health products/hallucinogens can be refused for import under the NHPR. *plant the plant's CBSA have stick to content from earlier re. RCMP*

7. CONSIDERATIONS

①

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use. *as young* Young adults have begun smoking the leaves and leaf extract recreationally.<sup>49</sup> It can be purchased through online botanical companies and other drug promotional sites and is often touted as a legal alternative to substances such as cannabis and mescaline.<sup>50</sup> Interestingly, after being widely available for over a decade, the drug *does appear to have had the same* has not had any extreme social impact as ~~the~~ LSD or ecstasy.<sup>51</sup>

While

②

Over the past few years, there has been an increase in the number of enquiries that Health Canada is receiving from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen. Health Canada has also observed a steady increase in the amount of media interest regarding the availability of *S. divinorum* in Canada. According to currently available statistics, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, *according to available statistics.*

<sup>49</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.research.hazelden.org](http://www.research.hazelden.org).  
<sup>50</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.  
<sup>51</sup> Munro, T. The Chemistry of *Salvia divinorum*. PhD dissertation, 2006. Accessed from: <http://eprints.infodiv.unimelb.edu.au/archive/00002327/01/Munro2006thesis.pdf> February 2007.

s.21(1)(a)

s.21(1)(b)

~~Salvia divinorum~~ meets the definition of a natural health product (NHP) under the *Natural Health Product Regulations* (NHPR). This means that products containing *S. divinorum* must be approved by Health Canada prior to sale in Canada and that products that are not in compliance with the NHPR may be subject to compliance and enforcement actions. As Health Canada has yet to receive and/or approve any applications for natural health products containing *S. divinorum* for sale on the Canadian market, the sale of such products is illegal. Several challenges also arise with respect to the importation and domestic movement of *S. divinorum* products as they are often declared as incense and therefore cannot be considered unapproved natural health products and seized. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and/or pharmacological effects. The NHPR are therefore limited in their capacity to control the availability of *S. divinorum* beyond the scope of scenarios listed above. *in fact*

Start para here

~~*S. divinorum* and salvininorin A are not structurally similar or even pharmacologically similar to other substances included in the schedules to the CDSA. [The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of the physical and psychotropic effects of *S. divinorum* have been carried out on humans. More controlled systematic research in this area is needed. Health Canada has only received a limited number of communications regarding *Salvia divinorum* from law enforcement agencies, and none of these have advised that the use of *Salvia divinorum* poses any particular threat to public safety. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way, as there is a lack of information regarding usage in Canada.]~~ because we have YSS + CADUMS ...

In regards to the previous HPFB recommendation to schedule *S. divinorum* under the CDSA, ~~this suggestion was deemed inappropriate and~~ likely based on a misunderstanding of the previously-described criteria upon which scheduling is based, ~~it~~ <sup>was</sup> did not consider a number of factors, including ~~namely the lack of evidence of potential for abuse and risk to public health and safety.~~ The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

~~Health Canada is currently finalizing media lines regarding *S. divinorum* as well as an "It's Your Health" article to be published on the Health Canada website. These documents are designed to address the recurrent media attention regarding *S. divinorum* as well as increase public awareness of the risks associated with this substance.~~

Subject Data re: Salvia divinorum samples

Hi Judy,

I am currently finalizing a scheduling assessment of *Salvia divinorum* (including Salvinorin A). A search regarding the number of samples which were found to contain these substances by DAS labs was completed in 2008, and I am hoping to be able to update the data to include 2008 to 2010 (if available). I've attached the 2008 email thread and the results of the previous search performed for your information.

Email Salvia 2008-10-10\_DAS.doc Email Salvia 2008-10-10\_DAS Attachment.pdf

I believe you are the correct contact person for this sort of request, however, please let me know if there is someone more appropriate for me to contact.

Good morning Cheyl:

See below the raw data information received.

The psycho-active agent in **salvia divinorum** is **salvinorin A**. As the plant and/or substance is not in the CDSD druglist, it is not possible to have any seizures of it in the database. There have been a number of samples containing the substance identified in the DAS labs.

Salvinorin A.pdf

Should you require futher information, or more statistical analysis, do not hesitate to contact me.

Subject Re: Fw: The use of Salvia as an incense

Dear colleagues,

Salvia divinorum has traditional medicinal uses among the native peoples of Mexico, e.g. for the treatment of topical ulcers of the feminine organs (Diaz 1976), to help normalize eliminatory functions (diarrhoea/constipation and urination), anemia, headaches, rheumatism, and alcohol addiction, in addition to its use as a hallucinogen in divination rituals (Valdés et al. 1983). The method of preparation is always an infusion of 4 to 120 pairs (10 to 300 g) of fresh leaves crushed and added to boiling water (a tea) -- low doses of fresh or dried leaves for medicinal purposes and doses of 50+ grams of only fresh leaves for divination/hallucination (Valdés et al. 1983).

There is no record in the scientific literature of a history of use of Salvia divinorum as an incense. Burning was not an established method of preparation in traditional uses as a medicine or as a hallucinogenic.

There are a few herbs where burning the leaves produces a very characteristic fragrance (e.g. cured tobacco, Artemisia, cedar).

However, most aromatic plants lose their characteristic fragrance when burned and simply smell like burned leaves. Gum-resins from trees, e.g. frankincense, myrrh, and copal, are much more common incense ingredients because they gradually release their volatile oils into the smoke (Simpson and Ogorzaly 2001).

Therefore, I believe that the production of "incense" from Salvia divinorum leaves or extracts is a recent invention to try to avoid compliance and enforcement actions.

---

Nevertheless, it may be difficult to argue in court that in the absence of any claims regarding hallucinogenic or other actions in humans, use as incense is not "legitimate" even if there is no history of such use and it just smells like burned leaves.

Robin

re: salvia divinorum

Hello Riaz

Further to our telephone conversation this morning. Thank you for responding to the CBSA request regarding the admissibility of the 2gms of salvia divrorum. I will make sure that Brenda and Evelyn know that you would like to be notified if we receive further requests related to shipments of this NHP since it is considered by OCS to be substance of interest. I have also attached the most recent information from the Inspectorate related to this product.

thank you for all of your help

**Request  
Informati**

on

<b>Requestor Name:</b>	Christine Zaczynski	<b>Directorate:</b>	HPFBI / DGPSA
<b>Request Type:</b>			Product Classification / Classification de produit
<b>Urgent?:</b>	No / Non		
<b>NHPD Submission #:</b>	N/A	<b>MECS #:</b>	N/A
<b>Product Name:</b>	N/A		
<b>Ingredient Name:</b>	Salvia divinorum		
<b>Product Licence #:</b>	N/A		
<b>Company Name:</b>	N/A		
<b>Site Licence #:</b>	N/A		
<b>Subject:</b>			Refusal of Salvia divinorum
<b>Brief Description of Request or Concern:</b>			<p>There have been several internal requests regarding Salvia divinorum (links below). This request is being submitted in hopes of tying them up.</p> <p>At a meeting on May 16th 2007 regarding Salvia divinorum (initiated by the OCS), it was decided that NHPD in collaboration with MHPD would work on a HRA (Health Risk Assessment) in order to help support the refusal of Salvia divinorum products which may fall under the Natural Health Products Regulations.</p> <p>The hope of this HRA is that it would extend the definition of "represented for use" such that a product would not need to be labelled with a claim in order to have the "representation for use" (i.e. as a hallucinogen). This could be grounds to refuse bulk Salvia divinorum</p>

shipments which do not  
make a claim.

Currently, bulk shipments are  
being received at the border.  
These products are not  
making a claim however links  
have been established at the  
retailer level for sale as a  
hallucinogen.

We would like confirmation  
that NHPD supports refusal  
of bulk *Salvia divinorum*  
shipments (without a claim)  
under the Natural Health  
Products Regulations?  
(either with established links  
to use, or without)

Note that the issue request  
#2 (below) is regarding bulk  
shipment claiming a non-  
NHP use (incense). This is a  
separate issue which may  
still need to be addressed.

Thank you,

Attachment(s) or  
Supporting Documents:

Previous requests and  
statuses: 1) <sup>(1)</sup>- status-  
"under review by Branch"  
2) <sup>(2)</sup> Until such time as the  
herb and its active constituent  
are scheduled under the  
CDSA or Schedule F to the  
Food and Drug Regulations,  
the NHPD has jurisdiction to  
receive a Product Licence  
Application for a therapeutic  
use.

3) <sup>(3)</sup> *Salvia divinorum* and  
salvinorin A are NHPs  
presenting a risk for abuse  
and thus are subject to  
immediate compliance action  
by the HPFB Inspectorate.

4) <sup>(4)</sup> The IAS was sent out for

review and comment.

Subje Re: Fw: Salvia Divinorum<sup>(1)</sup>  
ct

Hi Christine

While I think Jenny's assessment of the increasing public interest/ scrutiny regarding *Salvia divinorum* in her request for legal opinion is correct, OCS can't really comment on the suitability of issuing a stop sale or refusing shipments at the border as we have no authority to take those kinds of action that are not regulated under the *Controlled Drugs and Substances Act*.

My one concern with your proposed course of action, is that the Department may not be ready to deal with the potential backlash from legitimate business owners who have been selling salvia relatively peacefully for years, and who now find that they can't import the product and/or can't sell it. It is my view that we have not exactly handled all of the communications issues with the greatest of ease (and I am not apportioning blame here just stating the facts) and I fear that in not taking the time to predict the impacts of such action and prepare for them with appropriate media lines/ Q&As or even fact sheets, we will all just be bombarded with everyone that has written to us already, not to mention all those other people out there who didn't know they were doing anything "wrong" until this moment. In this light, I wonder if it might not be prudent to discuss your suggested action at the DG level meeting that has been planned for September 13 (my DG Andrew Adams is coordinating and I believe Chris Turner and Phil Waddington have been invited so far) so that all parties can discuss the impacts of such a step. For your information, we were asked to organize a meeting after Neil Yeates sent the BN prepared by MHPD to our ADM (the one that recommended scheduling), and it was clear that we need to come to some consensus about the status of this plant and agree upon next steps.

Hope this helps, and happy to discuss further.

Jocelyn

PS I was quite interested to read Simon Carvalho's opinion regarding the application of the NHPR, and I wonder if it means the HRA and IAS etc. need to be revised before it can be used as a rationale to support a stop sale etc?

Hello,

FYI- Please see below. We plan on moving forward with taking action on bulk Salvia products under the Natural Health Products Regulations.

We hope to use the HRA identifying the risk as a Type II in addition to the legal statement below (representation for use extended to off label).

Please provide us with any questions/comments you may have on this.

Christine

Hi Christine,

See response from Simon below regarding the classification of salvia divinorum. Based on this and the fact that NHPD has determined that salvia products pose a Type II health hazard, I think the Inspectorate should start taking action (i.e. stop sale, recall, refusal at customs) consistently against salvia products, regardless of whether there are health claims being made.

Re: Salvia Divinorum<sup>(4)</sup>

Hi Ruby,

Based on the label instructions for use, it appears that this product is to be used for a therapeutic effect. I would consider this product to be an NHP but will confirm with NHPD and get back to you ASAP.

Maggie - FYI. I will submit a PC request in the database now but as this product is being held at customs, please process asap.

Thanks,  
Jenny

Hello

A shipment of Salvia Divinorum is being held by CBSA, the shipment contains 66 pkgs of Salvia Divinorum 10X and 69 pkgs of Salvia Divinorum 5X , label of the product attached for your reference.

I believe this is a repeated shipment, previous shipment contains same product addressed to the same individual with different address in the same city in January 2007.

Salvia\_Divinatorum.pdf

I checked NHP Work Book and noticed that you have put a request similar to my situation, however, this one

- contains Oaxacan Salvia Divinatorum Extract, and declared " For incense use only "
- The product is a consumer package not in bulk
- Please check the label, Directions,.....could we still consider the product a "NOT-NHP" ?

Would you please let me know if NHPD would support refusals of the shipment under the NHPR?

Thank you.

Ruby Yang

[DD/MM/2010]

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, and/or its main active ingredient, salvinorin A, ~~are~~ regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has also noted an ongoing media

neither of which  
are currently

interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" <sup>hallucinogen</sup> alternative to street drugs on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

---

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.

On September 13, 2007, a further meeting between DSCSD, MHDP, NHPD and HPFBI led to the conclusion that DSCSD would conduct a scheduling assessment of *S. divinorum* in order to explore the possibility of scheduling this substance under the CDSA.

In September 2008, the Director Generals of DSCSD, MHPD, TPD and the HPFBI agreed that media lines and an “It’s Your Health” article on *S. divinorum* would be prepared.

#### **4.1 Relevant Legislative Frameworks in Canada**

##### **4.1.1 Food and Drug Regulations (under the Food and Drugs Act)**

The *Food and Drug Regulations* (F&DR) serve to ensure the safety, efficacy, and quality of health products offered for sale in Canada, including drugs and medical devices. Prior to being given market authorization, a manufacturer must present substantive scientific evidence that a product is safe, efficacious and of high quality. For drugs, Health Canada reviews this information carefully and, if the review is satisfactory, a Notice of Compliance (NOC) is issued and appropriate Drug Identification Numbers (DINs) are assigned.

A “drug” is defined under the F&DR as any substance or mixture of substances manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state, or its symptoms, in human beings or animals,
- (b) restoration, correction or modification of organic functions in human beings or animals, or
- (c) disinfection in premises in which food is manufactured, prepared or kept;

As no products containing *S. divinorum* or its extracts have been reviewed and approved by Health Canada as of July 2010, it is illegal to market *S. divinorum* when it is represented as a drug.

##### **↓ 4.1.2 Natural Health Product Regulations (under the Food and Drugs Act)**

The *Natural Health Products Regulations* (NHPR) aim to provide Canadians with ready access to natural health products (NHPs) that are safe, effective, and of high quality, while respecting freedom of choice and philosophical and cultural diversity. The NHPR require that all licensed products display a Natural Product Number (NPN), or, in the case of a homeopathic medicine, Drug Identification Number - Homeopathic Medicine (DIN-HM), on their labels. These numbers are issued once a product is authorized for sale in Canada further to a *natural health product monograph* or submission of other evidence of safety and efficacy. The NHPR also require that all manufacturers, packagers, labelers, and importers be licensed which in turn requires the presence of procedures respecting distribution records, product recalls, product handling, storage and delivery, and manufacturing practices.

The definition of an NHP under the NHPR has both a function and substance component. The function component refers to those substances that are manufactured, sold or represented for use in:

- (a) the diagnosis, treatment, mitigation or prevention of a disease, disorder or abnormal physical state or its symptoms in humans;
- (b) restoring or correcting organic functions in humans; or
- (c) modifying organic functions in humans, such as modifying those functions in a manner that maintains or promotes health.

The substance component refers to whether the product or medicinal ingredient therein is safe for consideration as an over-the-counter product, can be available for self-care and self-selection, and does not require a prescription to be sold. To be considered a NHP, no direct health claims need to be made regarding the substance. In the case of *S. divinorum*, it is generally marketed for its hallucinogenic properties which are considered a modification of an organic function. Therefore products containing it meet the definition of a NHP.

As of July 2010, no products containing *S. divinorum* have been reviewed and approved by Health Canada and no NPNs or DIN-HMs have been issued. Therefore sales of *S. divinorum* are illegal under the NHPR if it is represented for use as a hallucinogen or if other health claims in regards to modifying organic functions are made.

#### **4.1.3 Controlled Drugs and Substances Act and its Regulations**

The CDSA provides a legislative framework for the control of substances that can alter mental processes and that may produce harm to the health of an individual or to society when diverted or misused. Except as authorized under its regulations, activities such as possession, possession for the purposes of trafficking, trafficking, importation, exportation, possession for the purposes of exportation and production of controlled substances are prohibited under the CDSA.

The substances regulated under the CDSA are grouped into eight Schedules, and each Schedule

is associated with particular offences and penalties as described in Part I of the CDSA.

In determining whether a substance should be regulated as a controlled substance, and into which Schedule of the CDSA it should be placed, Health Canada considers the following factors:

- International requirements and trends in the control and/or scheduling of the substance;
- Chemical and/or pharmacological similarity to substances listed in the Schedules to the CDSA;
- Legitimate use of the substance, including therapeutic, scientific, industrial or commercial uses;
- Potential for abuse and/or addiction liability of the substance;
- Evidence of extent of actual abuse of the substance in Canada and internationally; and
- Risk to personal and public health and safety.

## 4.2 Assessment of *Salvia Divinorum* for Scheduling Purposes

### 4.2.1 International Requirements and Trends in the Control and/or Scheduling of the Substance

At the present time, neither *Salvia divinorum* nor salvinorin A are listed under the United Nations Drug Control Conventions and therefore do not have to be regulated as controlled substances in any of the countries (including Canada) that are signatories to these Conventions.

#### *Australia*

In June 2002, Australia became the first country to prohibit the sale, supply, possession and use of *S. divinorum* and salvinorin A. Although both *S. divinorum* and salvinorin A are listed in Schedule 9 of Australia's Standard for the Uniform Scheduling of Drugs and Poisons on the basis of "high potential for abuse and risk to public health and safety", no substantiation of this risk was provided at the time of this scheduling decision.<sup>3</sup> Schedule 9 is Australia's most restrictive drug schedule, and includes "substances which may be abused or misused, the manufacture, possession, sale or use of which should be prohibited by law except when required for medical or scientific research, or for analytical, teaching or training purposes with approval of Commonwealth and/or State or Territory Health Authorities."<sup>4</sup>

#### *Belgium*

A decree was passed in Belgium on October 22, 2006 which added *S. divinorum* to the list of controlled substances. This list includes substances such as psilocybin mushrooms, khat and peyote cactus.<sup>5</sup>

<sup>3</sup> <http://www.tga.gov.au/ndpsc/record/rr200111.pdf>

<sup>4</sup> [http://www.cognitiveliberty.org/news/salvia\\_australia.htm](http://www.cognitiveliberty.org/news/salvia_australia.htm)

<sup>5</sup>

<http://eldd.emcdda.europa.eu/html.cfm/index5176EN.html?pluginMethod=eldd.shownewsdetails&id=20/12/2006BE>

### **Denmark**

In 2003, Denmark added *S. divinorum* and salvinorin A to their list of "category B" controlled substances, a category which also includes psilocybin mushrooms, cocaine, amphetamine, and several others substances that are only legal for medicinal and scientific purposes. Illegal possession carries a penalty of up to two years in prison.

### **Germany**

*S. divinorum* (plant and plant parts) was added to Appendix I of the *Narcotics Act* in Germany on March 1, 2008, making it illegal to produce, traffic, or possess. The law does not specifically mention salvinorin A.

### **Italy**

On June 25, 2004, the Italian Ministry of Health issued an ordinance prohibiting the sale of *S. divinorum* and its active constituent salvinorin A. On January 11, 2005, the Ministry of Health made possession of *S. divinorum* and salvinorin A illegal by placing them in "Tabella 1" of the *Tabella Sostanze Stupefacenti o Psicotrope*.

### **Japan**

On November 9, 2006, the Japanese government added a group of thirty-three drugs to its list of controlled substances, including salvinorin A. The drugs are banned under a revised pharmaceutical law, under which persons involved in their illegal import, production, and sale, i.e. beyond medical treatment or research purposes, will be subject to up to five years imprisonment or a fine of up to five million yen.

### **Spain**

On January 28, 2004, <sup>↓</sup>the Spanish Ministry of Health and Consumption issued an order prohibiting the sale of *S. divinorum*. The regulation went into effect on May 6, 2004 and only prohibits activities related to commerce. Possession and/or use are not considered to be criminal offences.

### **Other Countries**

*Salvia divinorum* is illegal to possess or sell in Croatia, Latvia, Lithuania, Poland, Romania, South Korea and Sweden. In Russia it is illegal to grow or sell *S. divinorum*, but it is legal to possess it. In Estonia, Finland, Iceland and Norway, *S. divinorum* is treated as a medicinal herb and it is illegal to import it without a relevant prescription from a doctor.

## ***United States of America***

*S. divinorum* and salvinorin A are not included in the Schedules to the United States *Controlled Substances Act* although both *S. divinorum* and salvinorin A have been added to a list of chemicals "of concern" which has no legal implications. In addition, some individual states have implemented laws restricting its use, sale and/or distribution. As of July 2010, a number of states have enacted legislation placing regulatory controls on *S. divinorum* and/or salvinorin A including Delaware, Georgia, Florida, Hawaii, Illinois, Kansas, Kentucky, Maryland, Mississippi, Missouri, Nebraska, North Dakota, Ohio, Oklahoma, South Dakota, Wisconsin, Virginia, California, Louisiana, Maine, North Carolina, and Tennessee. More details regarding the regulation of *S. divinorum* in these last five states are provided below.

### ***California***

As of January 1, 2009, the sale or distribution of *S. divinorum* or salvinorin A, or any substance or material containing *S. divinorum* or salvinorin A, to any person under 18 years of age is a misdemeanor punishable by imprisonment in a county jail for not more than six months, by a fine of no more than \$1,000, or both.

### ***Louisiana***

In 2005, Louisiana passed a bill which prohibits the possession, production, manufacture and distribution of a material, compound, mixture, or preparation intended for human consumption and that contains a hallucinogenic plant. A "hallucinogenic plant" is defined as "any part or portion" of a plant on a list of forty plants, which includes *S. divinorum*.

### ***Maine***

In Maine, *S. divinorum* and salvinorin A are regulated in the same way as tobacco products; adults eighteen years of age or over can legally purchase and use the material, but selling or providing *S. divinorum* or salvinorin A to anyone under the age of eighteen is a criminal offence. Possession by a minor is a civil violation, punishable by a fine, community service, or both.

### ***North Carolina***

On December 1, 2009, the North Carolina State Legislature brought a new law into force which made *Salvia divinorum* and salvinorin A illegal. The only legal *S. divinorum* activities are the growing for aesthetic, landscaping, or decorative purposes or university-affiliated medical or pharmacological research.

## *Tennessee*

On July 1, 2006, Tennessee classified the deliberate production, manufacture, distribution, or possession of the active chemical ingredient in the hallucinogenic plant *S. divinorum* as a Class A misdemeanor. It is not, however, a criminal offence to possess, plant, cultivate, grow, or harvest *S. divinorum* for aesthetic, landscaping, or decorative purposes. The law also does not apply to any dosage that is legally obtainable from a retail establishment without a prescription when it is recognized by the Food and Drug Administration as a homeopathic drug.

### 4.2.2 Chemical and/or Pharmacological Similarity to Substances listed in the Schedules to the CDSA

The psychoactive ingredient in *Salvia divinorum* is salvinorin A. Other plants which contain psychotropic terpenoids are *Artemisia absinthium* (wormwood) and *Cannabis sativa*. Salvinorin A is considered by some as the most potent natural hallucinogen ever isolated.<sup>6</sup>

Unlike all other hallucinogens, salvinorin A is structurally distinct and does not interact with the serotonin-2A receptor or any other molecular target of classical hallucinogens. It thus affects the brain in a way that is quite unique.<sup>7</sup> Recent pharmacological screenings of receptors have found it to be a highly potent and selective  $\kappa$ -opioid receptor (KOR) agonist.<sup>8</sup>

The use of *S. divinorum* or salvinorin A can lead to a number of effects with variable onset and duration. These effects are generally accepted to be: sensation of becoming an object, visions of various two-dimensional surfaces, films and membranes, revisiting places of the past (particularly childhood), perceived loss of the body and/or identity, various sensations of motion (being pulled or twisted by a force of some kind), uncontrollable hysterical laughter, and overlapping realities (perceptions of being in more than one place).<sup>9</sup> Laughter, happiness, sense of well-being and dissociative effects were deemed the best aspects of *S. divinorum* by users, second only to the "trip" that the drug elicits.<sup>10</sup> Depersonalization, speaking gibberish, widening of consciousness and subjective illusions of rapid movement, flying or hovering have also been reported.<sup>11</sup>

<sup>11</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage).

The psychomimetic effects of *S. divinorum* closely resemble schizophrenia symptoms induced by lysergic acid diethylamide (LSD) or phencyclidine (PCP).<sup>14</sup> Yet, it is said to have only weak influence on the prevailing mood of the user which differentiates it from other hallucinogens such as LSD and psilocybin.<sup>15</sup> Its strong dissociative effects are often compared to those of ketamine. Users have reported that the psychedelic effects of *S. divinorum* were most similar to those caused by psilocybin mushrooms.<sup>16</sup> However, users familiar with the effects of other hallucinogens agree that despite certain similarities to classical hallucinogens, the visions and overall experience is quite unique.<sup>17</sup>

In addition, the psychedelic effects of *S. divinorum* are similar to those of classical psychedelics regarding changes in perception and somatic sensations. *S. divinorum* causes an unusually high degree of sedation, weakness and fatigue, while the increased de-realization is not commonly reported for classical psychedelics.<sup>18</sup> The combination of these effects seems to correlate with that of other KOR agonists such as pentazocine.<sup>19</sup>

#### 4.2.3 Legitimate Use of the Substance, including Therapeutic, Scientific, Industrial or Commercial Uses

*Salvia divinorum* has traditionally been used for spiritual and medicinal purposes by the Mazatec Indians in Oaxaca, Mexico,<sup>20</sup> where an infusion of the leaves or the leaves themselves are ingested to treat gastrointestinal problems, headaches, rheumatism, anemia and swelling of the

stomach.<sup>21</sup> Its main use today is, however, for its psychoactive properties in the aid of producing “mystical” or hallucinogenic experiences as part of spiritual rituals.<sup>22</sup>

Although selective kappa receptor agonists have been shown to produce analgesic effects, adverse effects such as psychotomimesis, dysphoria and diuresis have been observed in studies investigating their therapeutic use.<sup>23</sup> In addition, while it has been speculated that KOR agonists may prove to be useful in the treatment of certain psychiatric disorders including Alzheimer’s disease, schizophrenia, dementia and bipolar disorder,<sup>24</sup> much more research is needed in order to substantiate these hypotheses. Similarly, another study has suggested that chemical analogues of salvinorin A may be a useful treatment for those suffering from addiction to other substances.<sup>25</sup> That said, there are presently no legitimate medical uses for *S. divinorum* in Canada.

Similarly, there are no known industrial uses for *S. divinorum* in Canada. The plant is a semi-tropical perennial that can only grow outdoors in a humid climate where it will not encounter frost. Most websites offering *S. divinorum* cuttings and seeds for sale appear to do so in the context of growing the plant for its psychoactive properties, rather than out of horticultural interest or for its esthetic appeal. *in order to experience*

#### 4.2.4 Potential for Abuse and/or Addiction Liability of the Substance

Salvinorin A is a potent, selective agonist of the  $\kappa$ -opioid receptor (KOR), and in contrast to the euphoria produced by  $\mu$ -opioid receptor (MOR) agonists, KOR agonists are negatively reinforcing and aversive.<sup>26</sup> In addition, KOR agonists have analgesic properties but are not associated with respiratory depression like MOR agonists. Finally, while MOR agonists increase

the release of dopamine, the activation of KOR decreases dopamine release in the nucleus accumbens.<sup>28</sup>

The onset and intensity of the effects of *Salvia divinorum* appear to be related to the route of administration.

Traditional uses generally produce mild effects because the leaves are rolled and chewed or crushed and prepared as a foamy infusion whereby the salvinorin A is degraded in the gastrointestinal system before being absorbed into the bloodstream. Hence, the level of effect relates quite closely to the length of time the material spends in the mouth, with the onset of effect generally taking 5-10 minutes. The effects build over the next hour and last for another hour before they begin to subside.<sup>29</sup>

Routes of administration that avoid the hepatic first-pass effect (i.e. intravenous, intramuscular, inhalation and sublingual use) are the quickest and most intense.<sup>30</sup> Salvinorin A can be isolated from the plant to make a powder which can be vaporized and inhaled. The onset of effects felt from vaporizing salvinorin A powder occurs in about 30 seconds and effects last for about 5-10 minutes and then subside over the next 30 minutes.<sup>31</sup>

Smoking is by far the most popular method of administration<sup>32</sup> and this is accomplished by smoking the dried leaves or a concentrated extract using a pipe or bong. Dried leaves may also be fortified with a concentrated extract of salvinorin A. A concentrated extract can also be used sublingually. Neither *S. divinorum* nor salvinorin A can be injected because the powder is insoluble in water.<sup>33</sup>

The aversive effects of previously studied KOR agonists predict that the risk of addiction to *S. divinorum* is negligible. However, very few controlled scientific studies of the physical and psychotropic effects of *Salvia divinorum* on humans have been carried out. Therefore, it is difficult to predict its potential for addiction and abuse. In studies that have been conducted, there is conflicting information around the addiction liability of *S. divinorum* in both animals and humans. Some users have noted that they require increasing doses of salvinorin A in order to achieve the desired effect and the stimulated cerebral KOR may act as a mechanism of tolerance.<sup>37</sup> Further studies in this area and on the mediated decrease of dopamine as well as the impact of dose on the rewarding and aversive effects are also required.

While the concerns for the potential of abuse were once minimal because 1 kg of dried leaves yields only 3 to 6 human doses of salvinorin A, it was discovered that vaporizing and inhaling 200-500 micrograms had profound hallucinogenic effects.<sup>38</sup> The extraction of salvinorin A from the plant is very easy and with care, approximately 1.5 grams of pure salvinorin A per kilogram of dried leaves (8kg of fresh leaves) can be isolated, which is enough substance to provide for 2000 human doses.<sup>39</sup>

#### 4.2.5 Evidence of Extent of Actual Abuse of the Substance in Canada and Internationally

In Canada, the extent of actual abuse of *Salvia divinorum* and salvinorin A is relatively unknown.

There is, however, some data regarding the use of *Salvia divinorum* in Canada. Questions about the use of *S. divinorum* were included in the 2008-2009 Youth Smoking Survey, the 2009 Canadian Alcohol and Drug Use Monitoring Survey and the 2009 Ontario Student Drug Use and Health Survey.

As there are no established legitimate uses for this plant it can be assumed that all use is illegitimate in nature

The results from the 2009 Ontario Student Drug Use and Health Survey were published on November 18, 2009 and indicate that:

- Among all responding students in Ontario, 4.4% reported using *Salvia divinorum* at least once in the past year. In comparison, 58.2% indicated they had used alcohol, 25.6% indicated they had used cannabis and 5.0% indicated they had used hallucinogens other than LSD and PCP in the past year;
- Males (6.2%) were significantly more likely than females (2.3%) to report using *Salvia divinorum*;
- There is significant grade variation, with *Salvia divinorum* use most likely among 11<sup>th</sup> graders (8.6%) and 12<sup>th</sup> graders (8.4%); and
- There are significant regional variations, with students in Northern Ontario (9.2%) most likely to use *Salvia divinorum*.

The results of the 2008-2009 Youth Smoking Survey were published on May 31, 2010 and indicate that:

- 4.9% of students stated that they had used *S. divinorum* in the last twelve months. In comparison, 53.0% indicated they had used alcohol, 27.3% indicated they had used cannabis and 6.9% indicated they had used other hallucinogens in the last twelve months;
- 2.6% of students in Grades 7-9 and 7.0% of students in Grades 10-12 had used *S. divinorum* in the last twelve months; and
- Males (6.6%) were more likely to have used *S. divinorum* in the past twelve months compared to females (3.2%).

The scope of the previously mentioned studies did not provide for any explanations regarding differences in usage between ages, genders and regions. In this regard, it is difficult to speculate on the causality of such differences.

The Canadian Alcohol and Drug Use Monitoring Survey specifically examined Salvia for the first time in 2009. An estimated 1.6% of Canadians, aged 15 years and older, reported that they had used salvia in their lifetime, and 0.2% reported using it in the past-year. In comparison, the prevalence of past-year cannabis use among Canadians 15 years of age and older was 10.6%. 1.2% of respondents reported using cocaine or crack in the past 12 months, 0.9% had used ecstasy and 0.7% used illicit hallucinogens.

Health Canada's Drug Analysis Services (DAS) has identified salvinorin A in a number of

samples seized by law enforcement, as shown in the following table.

**NUMBER OF SAMPLES FOUND TO CONTAIN SALVINORIN A**

Year	Count
2006	9
2007	8
2008	4
2009	20
2010 (as of May 7)	8

<sup>2</sup> STRIDE reported items of *Salvia divinorum*.

\* Includes only January – May data in 2009.

It is difficult to determine the extent of actual abuse of *S. divinorum* in Canada or elsewhere as there appear to be inconsistencies in the literature regarding risk aversion. For example, one author states: "Many who have used salvinorin A find the experience extremely unnerving, frightening and overly intense and most have no desire to repeat the experience."<sup>44</sup> However, another study suggested that this is not the experience of all recreational users of *S. divinorum*.<sup>45</sup> Over eighty percent of users surveyed on a web-based questionnaire about their *S. divinorum* use said that they would probably or definitely use *S. divinorum* again.<sup>46</sup> Users have reported the negative effects of *S. divinorum* as: the short duration of action, lack of control over the

above to beginning of section

experience, persisting negative effects (most often anxiety),<sup>47</sup> sweating, chills, increased diuresis, impaired vigilance,<sup>48</sup> and negative after-effects including tiredness, feeling head heavy, dizziness, physical exhaustion, and some degree of malaise or 'hangover' as they 'comedown' from the drug.<sup>49</sup>

#### 4.2.6 Risk to Personal and Public Health and Safety

The increase in both the number of enquiries from various municipalities and members of the public and in the amount of media interest regarding the availability of *Salvia divinorum* in Canada may be an indication that the recreational use of *S. divinorum* as a hallucinogen is on the rise in Canada. However, there are no available statistics that indicate there has been a significant increase in *S. divinorum* use in the Canadian population and, in comparison to the use of other drugs such as alcohol and cannabis, the actual use of *S. divinorum* is quite low.

The potential for harm to the user and/or other individuals is primarily related to the hallucinogenic properties of the substance. Users may get up and walk around without apparent awareness of their movements, behaviour or surroundings, and distinction between self and surroundings is often lost. At doses greater than 1mg of salvinorin A, out of body experiences are frequent and loss of consciousness has been reported.<sup>50</sup> There is little information regarding the social behaviours of persons under the influence of *S. divinorum* products, and what risks their activities, such as operating a motorized vehicle, may pose to the general public. There is also very little data regarding the toxicity, teratogenicity or other long-term effects of *S. divinorum* use.<sup>51</sup>

As far as law enforcement is concerned, the Department has only received a limited number of communications indicating concern with respect to *S. divinorum* and none of these have advised that the use of *S. divinorum* poses any threat to public safety. The Royal Canadian Mounted Police (RCMP) has stated that while *S. divinorum* is readily available, it has not become a popular drug in Canada, probably due to its aversive effects such as anxiety and introversion.

A handful of case reports regarding the use of *S. divinorum* have been published in the academic literature. One report was an international case report in which a young man (19 years of age) described his perceptions after inhaling smoke from *S. divinorum*. The peak psychotropic effects, including prickling of the skin, fever-like hot flashes, muscular tremor, and depersonalization, were reached in less than five minutes after inhalation of an unknown amount of smoke from burning dried leaves.<sup>52</sup> Another report involved a 15-year-old male who presented

<sup>47</sup> Baggot MJ, Erowid E, Erowid F and Mendelson JE. Poster presented at the meeting of The College on Problems of Drug Dependence (CPDD), in San Juan, Puerto Rico, 2004.

<sup>48</sup> Bücheler R, Gleiter CH, Schwoerer P, Gaertner I. Use of nonprohibited hallucinogenic plants: increasing relevance for public health? A case report and literature review on the consumption of *Salvia divinorum* (Diviner's Sage). *Pharmacopsychiatry*. 2005 Jan;38(1):1-5.

<sup>49</sup> González D, Riba J, Bouso JC, Gomez-Jarabo G, Barbanoj MJ. Pattern of use and subjective effects of *Salvia divinorum* among recreational users. *Drug Alcohol Depend*. 2006 Nov 8;85(2):157-62.

s.21(1)(a)

s.21(1)(b)

to psychiatric emergency services with acute onset of paranoia, déjà vu, blunted affect, difficulties in thought processing and slowed speech after smoking *Salvia divinorum* over an unknown period of time. During his hospitalization all symptoms improved significantly except the feeling of déjà vu. Based on this case presentation, the author suggested that the feelings of déjà vu may be a long-term effect of *S. divinorum* use.<sup>53</sup> However, given that this is the only case report in which déjà vu was associated with the use of *S. divinorum*, more reports are needed to substantiate this finding.

In addition to the above-mentioned reports, in 2006, a case was reported in the U.S. in which a 17-year-old boy committed suicide after smoking *S. divinorum* for an unknown period of time.<sup>54</sup> It should be noted that alcohol and general depression were the main confounders in this case. After this case was reported, the state of Delaware passed a law which classified *S. divinorum* as a Schedule I controlled substance along with other hallucinogenic substances.

Like many drugs of abuse, users are often unaware of the potency and adulterants in the product they purchase. A study by Wolowich *et al.* (2006)<sup>55</sup>, showed that the salvinorin A content in five out of five *S. divinorum* products was falsely indicated on the label and 4 out of 5 products contained unidentified adulterants (i.e. vitamin E, caffeine).

Health Canada has only anecdotal information about the use and abuse of *S. divinorum* in Canada as well as the threat *S. divinorum* may pose to the health and safety of Canadians. Although reports of domestic adverse reactions related to the use of *S. divinorum* as a hallucinogen have been received through the Canada Vigilance database, it is important to note that the number of reports and the nature of reactions reported are not adequate to characterize the risk to the general population.

## 5. ASSESSMENT OF RISKS AND BENEFITS

<sup>53</sup> Singh S. (2007) Adolescent salvia substance abuse. *Addiction*. 102, 823-824.

de la Loi sur l'accès à l'information**

s.21(1)(a)

s.21(1)(b)

## 7. CONSIDERATIONS

The KOR-mediated aversive and dysphoric effects of *Salvia divinorum* do not appear to be hampering its use as young adults have begun smoking the leaves and leaf extract recreationally.<sup>56</sup> It can be purchased through online botanical companies and other ~~drug promotional~~ sites and is often

<sup>56</sup> Hazelden Foundation, 2004. Drug Abuse Trends. June 2004. URL: [www.reserach.hazelden.org](http://www.reserach.hazelden.org).

s.21(1)(a)

s.21(1)(b)

touted as a legal alternative to substances such as cannabis and mescaline.<sup>57</sup> Interestingly, after being widely available for over a decade, the drug does not appear to have had the same social impact as LSD or ecstasy.<sup>58</sup>

While there has been an increase over the past few years in the number of enquiries from various municipalities and members of the public regarding the availability of *Salvia divinorum* as a hallucinogen, the reported use of *S. divinorum* by young Canadians is much lower than that of alcohol or cannabis, according to available statistics.

The NHPR are limited in their capacity to control the availability of *S. divinorum* in that *S. divinorum* products are often declared as incense and therefore cannot be considered unapproved natural health products. In addition, compliance and enforcement actions, such as voluntary stop-sales, forfeiture, destruction, and administrative seizure, cannot be implemented unless the labeling of the product indicates that it is to be used for consumption and/or pharmacological effects.

The previous HPFB recommendation to schedule *S. divinorum* under the CDSA was likely based on a misunderstanding of the previously-described criteria upon which scheduling is based. In particular, it did not consider a number of factors, including potential for abuse and risk to public health and safety. The Office of Controlled Substances (OCS) was also not consulted by HPFB at the time this recommendation was made. In addition, among countries who have decided to control *S. divinorum* in some way, very little or no substantiation of the risks of *S. divinorum* upon which the decision was based are available.

Neither *Salvia divinorum* nor salvinorin A meet the criteria for scheduling a substance under the CDSA. Despite being regulated in some jurisdictions, neither the plant nor salvinorin A are scheduled under any of the UN Drug Control Conventions. *S. divinorum* and salvinorin A are not structurally or pharmacologically similar to other substances included in the schedules to the CDSA. There are currently no legitimate therapeutic or industrial uses for *S. divinorum*. The abuse liability and potential for dependence of *S. divinorum* is not known as very few controlled scientific studies of its physical and psychotropic effects have been carried out on humans. The extent of actual abuse of *S. divinorum* is also largely unknown. Evidence of a risk to public health and safety is anecdotal in nature and not quantified in any way as there is a lack of information regarding <sup>usage</sup> in Canada. Therefore, it would not be appropriate to include *S. divinorum* and/or salvinorin A under any of the Schedules to the CDSA at this time.

## 8. RECOMMENDATIONS

<sup>57</sup> Wolowich WR, Perkins AM, Cienki JJ. Analysis of the psychoactive terpenoid salvinorin A content in five *Salvia divinorum* herbal products. *Pharmacotherapy*. 2006 Sep;26(9):1268-72.

## 9. CONSULTATIONS

The Drug Analysis Services (DAS) was contacted in order to provide any data available regarding the identification of salvinorin A in samples submitted by law enforcement.

The Royal Canadian Mounted Police (RCMP) was contacted in order to establish their views with respect to *S. divinorum* use in Canada. The RCMP advised that though *S. divinorum* is readily available, it does not appear to pose a threat to public safety.

OCS has received a number of correspondences from Canada Border Service Agency (CBSA) officers concerning a lack of information regarding the status of *S. divinorum* and how the plant should be treated at the border. CBSA officers have also expressed concern regarding the plant's hallucinogenic properties. At present, only shipments of *S. divinorum* that are represented as health products/ hallucinogens can be refused for import under the NHPR.

### 2. ISSUE

Health Canada has received a number of enquiries from various municipalities and members of the public asking why Health Canada has not taken steps to control the availability of *S. divinorum*, and/or its main active ingredient, salvinorin A, neither of which are currently regulated under the *Controlled Drugs and Substances Act* (CDSA). These requests are further to reports from scientific and media sources suggesting that *S. divinorum* is being used by adolescents and young adults specifically for its hallucinogenic properties. Health Canada has

also noted an ongoing media interest regarding the availability of *S. divinorum* in Canada.

### 3. PURPOSE

To assess *Salvia divinorum* and/or salvinorin A against the criteria for the addition of a substance to one of the Schedules to the CDSA, and determine whether one or both should be regulated as controlled substances in Canada.

### 4. CONTEXT

*Salvia divinorum* is a species of sage which belongs to the mint family, and which is found in the form of dried leaves, extract and plant cuttings. Also known as "diviner's sage", the plant is known to induce illusions and hallucinations when chewed or smoked. Salvinorin A, the psychoactive ingredient in *S. divinorum* (also referred to chemically as a neoclerodane diterpene) is found primarily in the leaves, and to a lesser extent in the stems.<sup>1</sup>

*S. divinorum* is widely touted as a "legal" hallucinogen on the Internet, and has also been reported to be one of the most prevalent herbal products used as an alternative to illicit drugs among adolescents and young adults.<sup>2</sup> While very little is known about how and where *S. divinorum* is sold in Canada, it is suspected that it is mainly purchased over the Internet and/or bought at head shops or alternative life style stores, etc.

The use of *S. divinorum* as a psychotropic agent first came to Health Canada's attention in 2002. In 2004, Health Canada received four adverse drug reaction (ADR) reports associated with the use of *S. divinorum* as a hallucinogen, with three being considered non-serious (requiring no medical attention) and the fourth being considered serious (medical intervention was required). The serious ADR report involved the concomitant use of alcohol in a person diagnosed with Attention Deficit Disorder.

Further to the receipt of the aforementioned ADRs, the Marketed Health Products Directorate (MHPD) and the Natural Health Products Directorate (NHPD) of the Health Products and Food Branch (HPFB) prepared an issue analysis summary (IAS), which recommended that *S. divinorum* and its active ingredient salvinorin A be regulated as controlled substances. This recommendation was maintained when the IAS was updated in November 2006.

Later, in December 2005, MHPD and NHPD prepared a Signal Assessment (SA) (updated in June 2007) that eventually led to the preparation of a Health Risk Assessment (HRA), which concluded that *S. divinorum* or salvinorin A-containing health products would constitute a Type II Health Risk according to the Health Hazard Classification of the Recall Policy of the Health

Products and Food Branch Inspectorate (HBFBI). Such a risk is defined as “a situation in which the use of, or exposure to, a product may cause temporary adverse health consequences or where the probability of serious adverse health consequences is remote”.

Further to an Assistant Deputy Minister (ADM) discussion in April 2007, the Drug Strategy and Controlled Substances Directorate (DSCSD) organized a meeting with MHPD, NHPD and HPFBI to discuss *S. divinorum*. HPFBI was to determine appropriate compliance activities regarding *S. divinorum* and consult with the Canada Border Services Agency (CBSA) regarding the movement of products containing *S. divinorum* into and out of Canada.
