

++.5 4/9/79 MDOH prime for MDA. [-2:30] 100mg MDOH q.v. 4:30PM=[0:00][0:30] extreme paraesthesia [0:35] quiet entry to stoned state [0:40] cc 1.5+ [0:43] to ++. a nice stone - slight teeth clench some eye irregularity - easy to instigate nystagmus [1:00] slightly over ++. eyes, teeth - handwriting going downhill. piano so so. [1:10] teeth chatter - can play visual games. Some time showing. [1:30] sl. over ++, easy visual synthesis, shapes, lights take human form. [2:00] 2.5+ [2:15] still ++ [2:45] down to + - teeth clench [3:45] almost out - extend experiment [with] 200mg (1/2 J) SC grass. 8:15PM=[0:00] - the following is the most extraordinary time expansion I have ever experienced.

[0:13] starting  
 [0:16] coming on in waves - time slowing (elapsed) but radio pitch, speech normal tone.  
 [0:20] weeks later, another wave  
 [0:21] another wave - a little scary  
 [0:23] full +++ - pulse 180? hard to find pulse - over 3+  
 [0:26] Surely 3.5+ (I cannot use +++, reserved for other things)  
 [0:30] 3.7+ cannot find pulse- extreme time distortion. Shall I call Tusas?  
 [0:38] call Tusa's- CT is there - stays on phone. at 3.9+ Talk an hour that is a century - NT drives out - arrives 10:10 - this [1:55] - time is recovering. pulse 110. The time elapsed is alone distorted (from 5x to 20x depending on test) but pitch, word rate, piano play - all at normal time. How can these be separate and still exist concurrently? [2:45] repairing pulse 100 [3:30] time pretty much OK. some wine to try sleep. Speech OK, but get into some private logical search that doesn't seem a natural sequentor to others. I am sure that heart was OK all along. Food eating impossible at ~[0:30] - try to eat. had to spit out & wash mouth. Juices OK. Subsequent try just grass (same batch, 200mg) considerable intox. but negligible time distortion -nothing of value. Incredible! How can two clocks running at different rates always point to the same hour??? Visual synthesis is easy, but I was loath to let it take over - I had to stay in verbal contact.

Assay of grass alone - 6/23/79. **Inverness** - OK - then grass + DRED. (AP≡) - extreme loss of short-term memory - AP quickly - then slow recovery - me - slow to peak - nausea, vomiting - v.slow recovery [with] no memory of verbal outpouring - to beach - fog - to **inverness** - coffee - to S.F. (St.Andreas) [with] Tusa's - is pleasant - I have been exploited.

+++ MDE->LSD. 8/4/79. 160mg MDE; 80µg LSD (AP≡) 10:10=[0:00] alert [0:30][0:35] to +. [0:40] to ++ - plateau [1:00] at ++ [1:30] steady at beautiful ++; 80µg LSD (new base)(now[0:00]).[1:00] to 2.5+ v.nice. - up to +++ super window [2:40] still +++ - into indian **v.tricks** - no dark corners [5:00] dropping [7:00] to beautiful + still - modest appetite - evening wine extremely intoxicating - good sleep - AM still graceful & mellow. A beautiful +++ without corners.
