++ 30mg ++ 2/19/77 9:40AM=[0:00][0:32] first subtle note [0:45] slow window development very nice. [1:00] well into window - but the slow coming on makes it (1) easily assimilated and (2) difficult to quantitate. I must be 50%. [1:15] a change stopped - I am stable - search for new inputs [2:10] steady: all awareness truly enhanced - it would be impossible for any person, at this level, on this drug, to have a bad trip. There is nothing distorted, so there can be no misrepresentation as a result. No sensory distortion. [3:00] still full ASC, long talk [with] Eric fine! [4:30] still full. this is a slow MDA-equivalent to 80mg fully as controllable - a marvelous drug. Would be good for introducing a person to slow-on, slow off. No apparent impotency (unlike MDA). [6:00] dropping - window pretty much gone. some MDA gritty remains. [9:00] clear except for some teeth-rub. [11:00] all clear.

+++ 40mg 2/27/77 9:00AM=[0:00][0:30] note a trace light head [0:45-1:00] window developing slowly - occasional nausea [1:00-1:20] very smooth development of an ASC - I can surely do anything I wish (phone, count, stand, drive). Getting to this state (not the state itself) was so smooth it could be missed. The state is unmistakable however. [1:30] stretched feeling at eyes, above ears - as if eyes were popping - kind of a temporal orgasm feel - yet eyes are normal. This is continuous and nice. [2:00] ej intense - and after for a while. [3:00] still delightfully stoned [5:00] some dropping [6:00] 60% repaired - to SF (driving) but still some awareness of certain movement at recital [12:00] sl. residual tooth-rubby. This is \cong 100mg MDA but [with] longer time scale.

+++ 50mg 3/30/77 9:05AM=[0:00] (to estimate "long-acting martini" potential [0:30] 1st trace lt. head [0:42-1:10] - complete development of ASC - slightly pop-eyed! [1:35] fully stoned + !! yet I can control any needed sensibility (in the French sense) [3:00-4:00] lunch - still stoned - phone OK, talk OK [6:00] sobering up - I could drive OK - but then I probably could have all along. the teeth-gritty remains. [9:00] sober. teeth-quiet unpleasant temporal headache. [14:00] to sleep - no problems. Next day no residue, but rest anyway. Too long - too much gritty and jaw clench. Maybe the "R" isomer! Maybe the N-methyl?

+ 30mg 6/3/77 9:00AM=[0:00][0:45] slow development (1:30 real ± + off [with] gross cab to grove - at [3:00] no more than +- +15mg - little additional effect. evening clear. up to 4AM.
