

MDOH
MD-15

- 2mg 1/31/78 8:23AM 0.7mg - 9:43 1.3mg Σ 2.0mg n.e.
- 5mg 2/1/78 2:45PM n.e.
- 10mg 2/9/78 ATS 11:00AM=[0:00] a little wine that evening was very much felt ne
- 20mg 4/10/78 ATS 8:05AM=[0:00] - no effect.

- ± 70mg 5/19/78 ATS 8:30AM=[0:00] 40mg at [1:00] something? [1:30] clear
[1:45=0:00] +30mg. [0:30] again - a ± with something nice [0:45] more [1:15]
steady ± or even + [1:45] clear. [see 267](#)

- ± 80mg 5/31/78 ATS 9:00AM=[0:00] 4 days drug-free. [0:35] alert [0:50] develop -
fleeting nausea - but largely window. [1:00] + of window [1:30] stable at +
[1:40] drop [2:00] still more drop [2:20] - [see exploitation p. 267](#).
Interesting (+).

Sample on resynthesis has completely different properties.
This is probably MDA, generated by the in situ disproportionation of MDOH on distillation. Proper product is
now at hand, but assay must start again.

- ± 10mg 3/22/1979 10:40AM=[0:00] [1:10] could I kid myself at threshold? [1:35]
±? [2:00] maybe ±; maybe -? [3:00] - certainly -.

- 20mg 3/23/79 11:00AM=[0:00][1:40] a little unworldly? - no, nothing.

- + 60mg 3/27/79 10:15AM=[0:00] (initially 40mg) [0:40] alert? [1:00] a light but
real awareness - + - cannot quite character yet, but very interested - no
motor problems- [1:20] boost [with] 20mg. [2:00] an honest + [with] lotsa
sparkle [2:30] dropping - challenge [with] [LSD p288](#)

- ++ 80mg 3/30/79 10:35=[0:00][0:33] aware - diarrhea [0:45] going into something
- reasonably quiet entry. [0:50] paraesthesia [1:00] a simple + - MDMA like -
very simple. [1:20] between + & ++. [1:30] almost ++ simple! [1:50] dropping
[2:00] rapidly down - impotent [3:20] substantially out. good afterglow.

- ++ 100mg 4/9/79 2:00=[0:00][0:30] alert [0:35] start [0:45] developing - no
character yet- basically pleasant. moderately noisy. [1:00] to a simple +
[1:15] still developing [1:30] at ++, extraordinarily simple, even simpler
than MDMA. piano playing excellent [1:45] stable at ++ [2:00] beginning to
drop off ++ [2:30] back to + one. challenge [with] MDA, see primer study p317

- ++ 120mg 4/15/79 [12:54=0:00] AG 120, TG 100. Gradual & quiet [so, so quiet!]
development - AG feels like MDMA, then light LSD, then MDA - supplement
[2:20] 40mg each - quite a bit of intox. difficult to weigh but -
thermotropic - long, slow afterglow. intense anorexia - livid dreams,
significant - perhaps a bit much - very enjoyable but not too rewarding.

- ++ 100mg 4/28/79 [11:50=0:00]. ATS, BM, TG, AG, PB, FB, NT, CT, all 100mg] alerts
all ~[0:25 to 0:35] rapid development to ~[1:00] or [1:15] CT+Peggy briefly
intensely intox, then assimilate. Fred body ++? CT nearly +++ as was NT me
++. Benita ++. relaxed - none of the confidences of MDMA - straight intox but
delightful. Wide window st. drop variously between [3:00 and 5:00]? NT+Peggy
eye problem. negligible B.P. $\hat{\uparrow}$. Considerable anorexia. Most [with] long sleep
(deep) and languor next day. Impotent [with] BM but tactile much appreciated.
